The story, though, as we have said, graceful, has nothing in it specially original. A proud, warm-hearted, and cold-mannered girl marries the fascinating man of her choice; who, like many fascinating men of girlish choice, is practically worth very little, and is by no means in fact what her fancy has created him. They are entirely uncongenial, too, in nature and pursuits; she is tenacious, reserved, intellectual, and sensitive, while he is weak, good-natured, inconstant, and not specially honourable. The association of two natures so essentially dissimilar, brought together by passion on the one hand and blind idealization on the other, is necessarily one of sorrow and discomfort. Edith Daunt, the girl who marries Bertie Henderson, this handsome idol of her imagination, to find him, when too late, but a very poor kind of thing made of a very coarse kind of clay, has to pass through various matrimonial trials of the ordinary kind. Her dear old grandfather is taken ill while she is away on her wedding tour, and she comes back only just in time to see him die; her husband gets into debt, and in India "resumes his bachelor habits," "passing all his spare time in dancing, flirtation, and riding," "while she proudly resigned herself to her loneliness, and made no attempt to keep him by her side, grew daily colder and more reserved in her demeanour, and sought consolation in her old studies and the anticipation of the joys of motherhood." We must quote here the author's views on this matter, candidly expressed, and wiser than are the views of most women on the subject:—

She was wrong, of course. Had she tried to adapt herself to her surroundings, and been less austere with her husband, her path would have

been smoother. After all, he was not to blame. The idol she now discovered to be of clay had always been clay; it was her girlish imagination alone that had raised him upon an ideal pedestal. A little knowledge of the world would have made her more flexible, and taught her the true philosophy of making the best of her fate.

She still loved, though she no longer esteemed, her husband, but, persuaded of his indifference for her, would have died rather than confess it, and carefully abstained from all interference with his liberty of action. It would have been better to have roundly taken him to task than to have entrenched herself behind this icy barrier.

Greater trials are in store for this too statuesque and Minerva-like wife. Her baby dies soon after it is born, and her husband flirts outrageously with a Mrs. Trevelyan, an artful little jade who is the bad genius of the story, and poor Edith's uncompromising enemy all through. Finally, he dies in the first half of the first volume, after two years of marriage; and Edith, who had been his ice-cold wife, now, as his widow, with true feminine inconsistency, devotes herself to weeds and weeping as passionately as if her miserable marriage had been one of perfect happiness. After falling into a very morbid state of mind, she is induced to go to Florence for a season, which, we must confess, does not argue much common sense on her part, and almost excuses Bertie's naughtiness. She finds out by some letters that her grandfather, who had brought her up, had married as his second wife an Italian woman of low birth, who, it seems, had run away from him, taking his child with her. The little girl was very lovely, according to a picture drawn by her father; and Edith falls in love with the face, and expresses her intention of going to Italy to find out whether she is dead or alive. Her friend very sensibly reminds her that, "if alive, this sweet little thing is by this time a woman over forty"; but, as the story is to be laid in foreign parts, one peg may serve as well as another; and Edith goes to Florence to look for this ancient aunt to whose whereabouts she has not the slightest clue, and who, if living, may or may not prove to be a deplorable connexion. Meanwhile she falls in with "Miss Whitman" and Philip Bethune; and between love and friendship, fear and jealousy, art and literature, and her old enemy Mrs. Trevelyan to keep all alive, passes her time by no means in a stagnant condition of mind, if sometimes less than happily. At last the right moment comes; the missing aunt is discovered, and the crooked things are then made straight and the rough ones smooth. She begins life again as the wife of Philip Bethune—a husband warranted not to flirt, and who abhors debt and disorder as much as she herself does; and to this husband will be added an aunt whom she loved with prophetic fervour when only a friend, and whose companionship will be one of the joys of her future life.

It is a pretty little story, purely conceived and nicely written; and, save in the delineation of the Trevelyan, offers no point for grave reproach. But in both these characters the author has suffered herself to be ill-natured, and thus to be less the artist than the partisan. Several little touches in Mrs. Trevelyan's character, such as "her pointed scrawl" and the like, show an animus that is fatal to a story from the point of view of real art, and Major Trevelyan uses language which comes harshly from the pen of a woman.

If *In Change Unchanged* is at least true in its local colour, what shall we say of *Eugénie*? It has long been a standing reproach against French authors that they do not take the trouble to learn the most ordinary facts concerning those English people of whom they make their heroes and heroines. When they describe their English noblemen as going in for a round of *le baze* with a cabman, or selling their wives at Smithfield, we are not disposed to consider their work as showing much study or accurate ethnological knowledge. The author of *Eugénie* has not done a hair'sbreadth better; and the story, as an exposition of French life, is as absolutely silly and impossible as are those tales by Frenchmen who make two Englishmen meet in a desert and refuse to speak because they have not been introduced, or who credit the whole nation with characteristics worthy only of so many unconfined lunatics. The story of *Eugénie* sets forth how two young and beautiful French girls are living in a small country town with their widowed mother; and how there come to see them—staying in the house with them, all the same as if they had been an English family with a father and brothers to give them countenance—first a handsome young German, who turns out to be the son of Mme. de Gueymard's old friend, and then that cousin Gaston for whom Madame has destined her elder daughter Eugénie. This strikes the first false note in this curious little volume of discords. The second comes by Mme. de Gueymard allowing her daughters to entertain this young German alone; to sit with him in the garden, to take walks with him, have lessons in German from him, and, in short, to go through the whole life of American girls, rather than even of English ones, in a manner impossible to a French mother of almost any grade. When the cousin Gaston comes, who is to be, Madame hopes, her daughter's husband, she abandons even the semblance of chaperonage to him and says, "Now I shall be let off a great deal of chaperone (*sic*) duty, one of the greatest trials, and, I think, mistakes of French society; but this, as it is the law of the land (society?), we cannot very well go against it. But with Gaston with you, of course it will be all right";—this meaning that the two girls are to go with this cousin and the young German on a visit to a friend's house, where they are to stay for a day or two. Now such a speech and such a course of action as this is just as true to life in France as the selling of wives at Smithfield and taking a

* *In Change Unchanged*. By Linda Villari, Author of "In the Golden Shell," &c. 2 vols. London: Macmillan & Co. 1877.
Eugénie. By the Author of "Miss Molly." Edinburgh and London: W. Blackwood & Sons. 1877.

friendly turn at *le bore* with cabmen is to life in England; as true as the kind of love which Max makes and Eugénie allows, as Gaston's generosity in sending her to her lover alone, in the evening in the garden, and as the secret marriage of the young people in a church by a priest. We do not expect our novelists to be very profound in any branch of science, experimental or historic; but we really think the author of *Eugénie* has gone beyond the limits of allowable ignorance—wide as those limits are—when she makes a French priest marry two young people who wander into his church, with no more inquiry, misgiving, or redtapeism than if he had been the famous blacksmith over the border (in France of all countries, where marriage is hedged round with the most carefully constructed barriers, and a secret union of the kind described is simply impossible), and puts into a French mother's mouth the formal abdication of her chaperonage over her daughter, in favour of an unmarried male cousin and a young soldier guest. Beyond all this, the book is sentimental, scrappy, goody, and decidedly a falling off from the author's first essay, *Miss Molly*, which itself was by no means up to the highest standard.

THE INTERCOLONIAL RAILWAY.*

A GEOGRAPHICAL caprice of nature, so to speak, has affected the relations between those British North American territories, now styled the Dominion of Canada, which were united ten years ago in a provincial Confederation. Upper and Lower Canada, properly bearing that name, occupy the interior region along the banks of the St. Lawrence and the shores of the great Lakes. That river, which is the outlet of their waters to the Atlantic, should likewise be the channel of their maritime traffic, and is thus available for commerce during part of the year. But its lower course and estuary below the port of Quebec, turning from an easterly to a northerly direction, are locked up in winter by the ice barriers of a severe climate, or rather by the drift of ice from the Arctic seas. They are separated from the Atlantic shores within milder latitudes by an oblong block of the mainland, comprising New Brunswick, with an adjacent strip of Lower Canada on the right bank of the St. Lawrence, and with a portion of the State of Maine, to the southward, belonging to the New England group in the United States. The peninsula of Nova Scotia is attached to the north-western extremity of New Brunswick at its very corner, hanging far out in the Atlantic, with the large islands of Newfoundland and Prince Edward Island lying outside of it, and partly enclosing the Gulf of St. Lawrence. This distribution of their lands, between the extensive navigable waters of the continental interior on the one hand and the open sea on the other, makes New Brunswick and Nova Scotia the needful doorway to Canada in the winter season. Their excellent harbours, especially that of St. John in the Bay of Fundy, on the South-east coast of New Brunswick, and that of Halifax, on the Atlantic coast of Nova Scotia, are conveniently placed for the intercourse to be kept up with Europe by the inland Canadian provinces in winter. The harbour of Portland, in Maine, alone presents in some degree the facilities of accommodation which enable it to compete with Halifax for the external traffic of the Dominion. As Portland belongs to the United States, there are strong motives of political expediency for securing the preference to Halifax, which is not only our own port, but the nearest Transatlantic port to Great Britain.

These circumstances give a more than local or technical interest to Mr. Sandford Fleming's account of a highly creditable work of railway construction which he completed last Midsummer, furnishing Lower Canada with means of access, through the northern parts of New Brunswick, to the Nova Scotian Atlantic coast. It is remarkable, indeed, that, so long as forty-five years ago, soon after the opening of the first railway in England, a project was discussed of making a railway from Quebec to St. Andrews, in New Brunswick, at the mouth of the Bay of Fundy. This would have left out Nova Scotia entirely, but would have supplied the shortest possible route from Quebec to the ocean-shore. The scheme was propounded by Mr. Henry Fairbairn in the *United Service Journal* of 1832. It seems, about 1836, to have obtained energetic support in the Colonies, with some encouragement from the Whig Ministry in Downing Street. But it was suddenly checked by peremptory orders from that quarter, upon a representation from the United States' Government that the country lying between the St. Lawrence and the Bay of Fundy was part of their State of Maine. The British Government, having just then to deal with the French-Canadian rebellion, did not venture to oppose a decided negative to this claim of a foreign sovereignty. A few years later, in the feeble negotiations conducted by Lord Ashburton in 1842, surrendering a large portion of New Brunswick, our American colonies were effectually deprived of their most direct independent access to the sea. A brief sketch of the history of this boundary question is introduced by Mr. Fleming into his narrative of the hindrances and disappointments of early intercolonial railway schemes. The dispute was first raised upon the application, to an actual topographical survey, of certain clauses in the Latin text of letters patent granted by King James I. to the Earl of Stirling as

founder of Nova Scotia. There was a doubt concerning the river St. Croix, from the most westerly source of which the boundary-line was to run due north until it should strike upon the nearest stream flowing into the St. Lawrence, or "great river of Canada." But there was a further ground of difficulty in applying the speculative provisions of the treaty concluded with the United States in 1783, by which the aforesaid due north line was presumed to run "along the highlands which divide those rivers that empty themselves into the St. Lawrence from those which fall into the Atlantic Ocean." There is, in fact, no such range of highlands directly to the northward of the St. Croix; but to the north-west, as is explained by Mr. Fleming with the aid of a special map, may be found the true watershed in question, parting the sources of the Chaudière, in Lower Canada, from those of the Kennebec and Penobscot, which belong to Maine. The highlands of New Brunswick to be reached by a due north line from the St. Croix are those which separate the Canadian Rivière du Loup and Metis, and the streams falling into the Gulf of St. Lawrence, from the tributaries of the St. John, which last-mentioned river descends to the Bay of Fundy. It was established, by the arbitration of the King of the Netherlands in 1831, that the treaty of 1783, in speaking of rivers which fall into the ocean, did not mean any of those which fall into a gulf or bay of that ocean. The United States, or Maine, should possess the rivers only flowing direct into the Atlantic. Unfortunately, however, this principle was lost sight of in Lord Ashburton's concessions of 1842, which gave up the southern alluents of the upper St. John river, with an extensive tract of country in the heart of New Brunswick. It was not the whole of this, which had been wrongfully claimed and invaded; but it was the only district through which, as appeared from later surveys, a railway could well be made crossing the interior of that rugged land from the St. Lawrence estuary to the Bay of Fundy. The consequence of this territorial loss, since political and military considerations demanded an intercolonial line passing all the way over British ground, has been the adoption of a circuitous route along the north-east coast, round the Bay Chaleur, and by Miramichi on the Gulf of St. Lawrence. But it may be hoped that the result will afford some compensation at least to New Brunswick in the commercial advantages it should bestow on the ports of that coast.

The intercolonial link of railway communication was the subject of an express stipulation in the Act of 1867 uniting the provinces in one Dominion. It had been preceded, we should observe, by the construction of railways in each of the three provinces, taking a parallel north-easterly direction towards the coasts of the Bay Chaleur and Gulf of St. Lawrence. The Grand Trunk Railway of Canada, joining Sarnia on Lake Huron with Toronto, Montreal, and Quebec, had been carried on from Quebec along the right bank of the St. Lawrence estuary to the Rivière du Loup. In New Brunswick, while Fredericton, the official capital, had been connected with the port of St. John, a line had also been made from St. John to Moncton, upon the north inlet at the head of the Bay of Fundy, and thence to Shediac, on the east coast, opposite Prince Edward Island. In Nova Scotia there was a short line already opened from Halifax to Truro, which last-mentioned place is situated, like Moncton, at the upper end of the Bay of Fundy, in a corresponding branch or inlet to the eastward. To join these three provincial railways in one system has been the work of the last ten years. Mr. Fleming was first called upon to advise the Dominion Government regarding the choice of a line to cross New Brunswick and meet the Grand Trunk Railway of Canada. This question, involving many local and private interests, was keenly disputed in the press and Legislative Assembly of New Brunswick. Some parties wanted the railway to go up the St. John river above Grand Falls, which was certainly the most direct course to strike the Canadian shore of the St. Lawrence at Rivière du Loup. The objection to this line being made the regular means of communication between the provinces of the British Dominion was plain enough, as it skirted the United States' new frontier under the "capitulation" of 1842. But it will nevertheless be found a requisite convenience, like the railways between Maine and the St. John, for the purposes of commercial traffic, though Canadian Dominion patriotism is unwilling to admit that the best market for the St. John district lies in the United States. A middle line, to run across from Petitcodiac, midway between St. John and the Eastern seacoast, was favoured by some of the authorities; but it would have traversed a difficult mountainous country, with little promise of intermediate traffic. We cannot therefore doubt, from the clearly and fairly stated arguments on each side in this volume, that the final adoption of the Bay Chaleur or East Coast route was fully justified. It is the one which was recommended in 1848 by Major Robinson, R.E., also by the Commissioners for the defence of Canada in 1862, and by Colonel Jervois, Deputy Director of Fortifications, two years later; it was indeed pronounced by the Imperial Government, in 1868, to be the only route which sufficiently provides for national interests. The chief engineer, however, discreetly abstained from interfering with this question in his opinion, was expressly asked by the Dominion Government, re-

The remainder of his book consists, for the most part, the minute account of the surveys and local arrangements for the different main links and minor sections of the intercolonial, most the details of engineering construction. These matters will reward the attention of readers who are curious about island, geography or topography, and those who care for professional technical examples. Some particulars may here be collected to give a precise view of the character of the entire work. The half-year

* *The Intercolonial: an Historical Sketch of the Inception, Location, Construction, and Completion of the Line of Railway uniting the Inland and Maritime Provinces of the Dominion.* With Maps and numerous Illustrations. By Sandford Fleming, C.E., Engineer-in-Chief of the Newfoundland, Intercolonial, and Canadian Pacific Railways. Montreal: Dawson Brothers. London: Sampson Low & Co.

is five hundred miles from the Rivière du Loup, on the St. Lawrence estuary, to Cobequid Bay, at Truro in Nova Scotia, the head of the Bay of Fundy. This is divided by the chief engineer into four districts—namely, the St. Lawrence district, along the shore of that estuary or arm of the sea, as far as Metis, where the line turns to a north-easterly to a south-easterly direction; the Restigouche district, so called from a river of that name, which falls, with its tributary the Metapédia, into the Bay Chaleur, the Miramichi district, with the well-known commercial port of Miramichi; and the Nova Scotia district, from Moncton to Truro, connecting the St. John and Shediac line of New Brunswick with the railway from Halifax by Truro to Pictou, on the Gulf of St. Lawrence. The last-mentioned district is rich in mines of coal and iron, which have been accommodated in some instances, with other local interests, by an occasional bend or circuitous route. Mr. Fleming, indeed, looking rather to the general interest of the Dominion as a whole, and the cost of working its through traffic, was inclined not to give way so much to local demands, but his judgment in this was sometimes overruled, as in the building of three wooden instead of iron bridges, by the late official Railway Commissioners. His executive task seems to have been performed with praiseworthy care and skill, assisted by a numerous engineering staff, whose names, both of the living and the dead, are conspicuously recorded, with those of the contractors, in Mr. Fleming's very complete Report. The successive operations of the exploratory survey, the location and the construction of the railroad, are methodically described, we are told all about the rivers, the rocks, and the bays, all the bridges, cuttings, tunnels, embankments, and all the details of the way through such natural obstacles, and all the exact quantities of earthwork and masonry for each section. The main line is over two branches of the Miramichi river, a little above their junction near the town of New Brunswick, these having a width of 1,350 feet and 1,600 feet respectively, with tides rising five and sometimes ten feet, are not least in importance among the railway works, and there is a skew-bridge over the Restigouche, at the mouth of the Metapédia, on the boundary of the Quebec province. This seems yet more remarkable from the plans, sections, and other drawings here presented, and from the author's description of terrible "freshets" and "timber drives," battering the pieris even hitting the superstructure. We may try to fancy a "jam" of piled-up masses in the stream pent between high and steep hills with a winding course, raising its dammed back of od-water about twenty feet till the obstruction suddenly breaks, and the moving heap of thick overlaid ice, uprooted trees, logs, and other driftwood, rushes onward far down the river. In other instances, but especially in the effects of frost and thaw upon the steep slopes of cuttings and embankments, and the enticework behind masonry, engineers may learn something, we presume, from Mr. Fleming's experience in such a climate. He ventures to claim, probably not without good reason, a degree of merit for the Intercolonial, with regard to the soundness and stability of its permanent way, second to no railway of this kind in America or in Europe.

A subject of collateral or contingent interest, that of the best port and route of passenger and mail traffic from England to the chief cities of America, is treated by Mr. Fleming in the extracts from his preliminary Report of 1865, which form an appendix. He contends that the harbour of St. John's, Newfoundland (this name ought to be changed, to avoid confusion with St. John's on St. John in New Brunswick), should be made the landing-place, being 1,640 miles from Valencia, at the south-west corner of Ireland. The ocean run for mail steamers is from Cape Clear to Cape Race, respectively near to the harbours of the European and American shores. A railroad should cross Newfoundland to St. George's Bay, on the west coast of that island, whence the mails and passengers could be taken by another steamer, within sixteen hours, across the Gulf of St. Lawrence to Shippagan, at the entrance to the Bay Chaleur. Here is now the International Railway of the Dominion, ready for their prompt conveyance all over Canada, or to the United States. Mr. Fleming computes that from London by this means to the city of Toronto or New York the journey might be accomplished in about seven days, and in less than eight to Chicago. It does not seem at all impossible, but the Gulf of St. Lawrence is rarely navigable during a part only of the year. Halifax and Portland are likely to retain in future the maritime advantages of their open front position on the Atlantic seaboard.

MINOR NOTICES.

THE fourth volume of the translation of Comte's *System of Positive Polity*, which has been undertaken by several of the leading members of the Comteist body in this country has now appeared. It contains the essay on "The Synthesis of the Future of Mankind," translated by Dr. Congreve, together with, in an appendix, Comte's early essays, translated by Mr. H. D. Hutton, and thus completes what may be regarded as an authoritative English version of the text. In the publication of this edition such Positivists have taken the most practical way of showing their own faith in their master's system, taken literally and unrounded, by laying it open to their countrymen without any reservations; but it may be doubted how far this is likely to

be of avail. There is, of course, no question that Comte's *System of Positive Polity*. By Auguste Comte. Vol. IV. Longmans, Green, & Co.

was a man of genius, and that his earlier works contain much sound and valuable instruction. The publication of his *Cours de Philosophie Positive* has been justly called "the great epoch of his life"; for it not only demonstrated his intellectual power, but also his high-minded courage and disinterestedness in devoting himself to a cause which he believed to be essential to the progress of humanity, though he was well aware of the unpopularity and sacrifices which the propagation of it would entail upon him. Of the *Philosophie Positive* it is, therefore, impossible to speak without respect, whatever difficulties there may be in accepting some of its doctrines, but Comte's subsequent work, *Système de Politique Positive, ou Traité de Sociologie instituant la religion de l'humanité*, is of a very different character. In the latter he threw over the objective method, and adopted the subjective, instead of basing conclusions on facts proved by observation, he gave himself up to arbitrary and imaginative deductions from principles which he himself had invented in order to suit his new ideas, and in short abandoned philosophy in its scientific form for a vague, fantastic theology of his own creation. This change in his mental constitution was in a not measure due to the passionate attachment which, after being separated from his wife, he had conceived for Mme. Clotilde de Vaux, and which gradually developed into a kind of mystic adoration. When she died, he paid weekly visits to her tomb, and every day prayed to her for guidance and protection. It was under this sentimental and mystic influence that he composed his system of Positive Polity, the natural result of which was to alienate a large section of those who had previously accepted his teaching, including the most eminent of his adherents in this country. On the other hand, the "Polity" has been taken up by those who, like Dr. Congreve, regard it as containing the essence of "true Positivism." This explains the choice of the "Polity" for translation, as marking the essential elements of the new religion, which is in fact, as Mr. Lewy has described it, simply "a scheme of sacerdotal despotism." The contents of the volume before us fully confirm this view. In one of his prefaces the author asserts that "the republican situation has become the primary condition of material order, by the fact of its being the only form of government which admits of an energetic dictatorship." It is also stated, in the chapter on "the life" of the new communion, that the spiritual wants of the West are to be provided for by "a corporation of twenty thousand philosophers," of whom France would have a fourth, and that "the whole spiritual hierarchy is immediately and unintermittently under the influence of the High Priest of Humanity" (Comte himself), who "nurses, transfers, suspends, and even discards, on his sole responsibility, any of its members." It is also pointed out that "the vastness of his office makes it necessary for the Pontiff of the West to call habitually to his aid seven national superiors, a body which will be increased in proportion as the Positive religion advances towards its normal state of universality," and will furnish forty-nine members "when mankind is completely regenerated." The costume of the priesthood was not quite fixed by Comte, but it was laid down that "the form of clothing will remind people that the priesthood, by its true position intermediate between the sexes, has more affinity with the female sex, which may be supposed to imply the wearing of petticoats. Comte also gives a "decisive proclamation" that "the theoretical and practical servants of Humanity claim as their due the general direction of this world, their object being directly to construct the true Providence, moral, intellectual, and material, excluding for ever from political supremacy all the various servants of God, Catholic, Protestant, or Deist, as at once belated and an element of disturbance," and it is further stated that Positivism unites in itself the "opposite excellences of the two monotheisms its precursors"—that is, Catholicism and Islamism.

Professor Huxley has now published in this country three lectures on evolution, which he delivered in New York in September last, together with his address at the opening of the John Hopkins University at Baltimore, and a lecture on biology in connexion with the Collection of Scientific Apparatus at South Kensington. His opinions as to the theory of evolution are already well known, but this volume has a special interest as containing the latest statement of them. While admitting that "cautions men" will allow that there may have been a time when nature did not follow a fixed order, when the relations of cause and effect were not definite, and when extra-natural agencies interfered with the "general course of nature," he starts with the assumption that "whatever may be men's speculative doctrines, every intelligent person now guides his life and risks his fortune upon the belief that the order of nature is constant, and that the chain of natural causation is never broken." After stating in his first lecture the various hypotheses which have been entertained as to the past history of nature, he goes on in the second to exhibit the neutral and favourable evidence in behalf of evolution, remarking that, "whether variation depends on some intricate machinery—if I may use the phrase—of the living organism itself, or whether it arises through the influence of conditions upon that form, is not certain, and the question may, for the present, be left open; but the important point is that, granting the existence of the tendency to the production of variations, then, whether the variations which are produced shall survive and supplant the variations is a small matter which depends entirely on those conditions which give rise to the struggle for existence." He also points out that, while allowing for the persistency of certain types, it does not follow

* *American Addresses; with a Lecture on the Study of Biology.* By Thomas H. Huxley. Macmillan & Co.

from the absence of organic remains in a deposit that animals did not exist at the time it was formed, as their remains might be due to the solid material of the skeleton having dissolved away. The third lecture is chiefly occupied with illustration which is said to be afforded by the structure of the horse that "the history of the horse-type is exactly and precisely what could have been predicted from a knowledge of the principles of evolution"; and that these principles will be still further confirmed when the still lower Eocene deposits, and those which belong to the Cretaceous epoch, have yielded up their remains. Mr. Huxley then states his general conclusion that, as far as inquiry has gone, there is demonstrative evidence of evolution and a coincidence of the observed facts with theoretical requirements; in fact, "the whole evidence is in favour of evolution, and there is none against it." He also challenges the idea that evolution requires the lapse of a very vast period, inasmuch as this is at present a question between the geologists on the one hand and the astronomers and physicists on the other.

Among Mr. Bagehot's last contributions to *Economist* was a series of papers on the depreciation of silver, now republished in a volume, together with the evidence he gave as a witness before Mr. Goschen's Committee on the absence of sufficient experience of the actual condition of supply, he was prevented from arriving at any very positive conclusions; but his view was, in the main, that the great fall in the price of silver in the beginning of last year was only a momentary accident in a new and weak market, and not the permanent effect of lasting causes; that the demand for silver as currency was stimulated by its cheapness here and in America, and had carried off the late supply; that this demand could be increased as opportunities arose; and that, at any rate, there was as yet no proof that the permanent value of silver, whether in relation to gold or to commodities at large, could change so much as to render necessary any alterations in Indian currency or taxation. Whatever may be the future course of the question, these articles will at least be a useful record of an interesting phase of it.

Mr. Reginald Palgrave, who holds the office of Clerk-Assistant at the Table of the House of Commons, has put together in a clear and concise form a series of suggestions and rules for the guidance of chairmen of public meetings, drawn from the procedure of Parliament. In a prefatory letter to the Speaker he argues that the practice of the House is in one respect generally misunderstood by chairmen of meetings—namely, in the latter according priority to the amendment over the motion. Mr. Palgrave points out that this is not only a misleading practice in itself, being apt to stand in the way of a fair consideration of the original issue, but also that it is not the rule of the House of Commons, where, on the contrary, the formula—that "the words proposed to be left out stand part of the question"—is framed expressly to avert an immediate conflict between the motion and the proposed amendment, but to keep both questions before the House till the final moment. Mr. Palgrave then lays down the rules which, allowing for the difference between the House of Commons and a public meeting, he deems suitable for the latter, one of which is that the chairman should have an absolute power of immediate adjournment in the event of any rude or violent behaviour. He also notices the "Previous Question" as used in the House of Commons, remarking that it is a perplexing method, as, according to present usage, the members who propose it move that the question which they oppose "be now put," and then vote against their own motion; and he suggests that the motion should be that "the question be not now put."

An edition of Milton has been added to the well-known "Globe" series, with introductions by Professor Masson, which are in substance an abbreviated adaptation of what appears in his Library edition, and in which he aims at supplying a continuous and detailed literary biography of the poet. In his preface he notes, with a regret which will be generally shared, the disappearance of the house, No. 19 York Street, Westminster, which was Milton's residence from 1652 to 1660.

A "popular edition" has been issued of Lady Herbert's translation from the French of biographies of St. Monica, Mlle. Victorine de Galard Terraube, and the Venerable Mère Dévos, Superior of the Society of Sisters of Charity of St. Vincent de Paul. These biographies are written in the usual style of such narratives, and give one the impression that human nature is rather left out of account, all the saints in question being represented as absolutely perfect throughout, from childhood to their last days. Perhaps the most characteristic picture is that of the "Vénérable Mère Dévos," of whom we are told that "from a very early age she showed an unusual spirit of devotion, recollection, and silence," and during the rest of her life "her virtues and holiness were continually on the increase"; that, having once "broken through every human tie," she "allowed no indulgence to natural feelings," and held that "a Sister of Charity should avoid as much as possible all connexion with her family";

English title which would convey
French ones; but he might surely
than make *L'Étourdi* "The Blunderer,"
culs "The Affected Ladies."

Mr. Simmonds's work on the preparation, commercial value of animal products, was prepared by order of the Committee of Council on Education, in order to serve, in the first instance, as a descriptive guide to the collection at the Bethnal Green Branch of the South Kensington Museum, and also as a practical treatise on economic zoology for the general public. It makes a very interesting and useful volume, and is well illustrated.

Mr. Austin Dobson has already made a reputation not only as a graceful writer of *vers de société*, but as one capable of an occasional effort in a higher strain; but his new volume, on the whole, scarcely sustains the favourable impression produced by his earlier writings. Most of the pieces now given have appeared in various periodicals; and it may be thought that the volume would have been improved by judicious compression. Nothing can be more agreeable in its way than Mr. Dobson's neat and flowing verses; but when collected in a mass they somewhat lose their effect from the close family resemblance which they bear to each other in mannerism and subject. His chief merit is that of metrical skill; but there is a want of depth of feeling, and the ideas are apt to be thin and commonplace. Any one who turns to *Præd* will see at once that though his imitators sometimes catch his style of versification, they cannot reproduce his wit and epigrammatic point. This is still more marked in Mr. Donmett's *Flotsam and Jetsam* and in Mr. Cholmondeley Pennell's *Pegasus Re-saddled*, which are mere mechanical exercises, smoothly enough written, but destitute of poetical sentiment.

Mr. Renton, too, has a certain command of literary expression, but he falls into the error of trying to represent the colours of nature by verbal description, as will be seen from the following examples. The moon on a cloudy night

Glow paly lemon, with a fringe
Of orange dusking.

And here is a chromatic blaze:—

And all abroad the light is mazed.
With verdure, and the greens are hazed
With amber; other hue enthralled
With topaz or with emerald.

Again, we have a picture of a

Shifting waste of alim-blue brine
And fading olive hyaline:
Till all the distance overflows
The green in watchet, and the blue
In purple. Now they fuse and close
A darkling violet, fringed anew
With light.

Elsewhere a hawthorn thicket in the dusk is described as "A gruesome greensome splashed with blood"; pines as "green stalactites in an azure heaven"; and fields as "madder-haunte

arded all creeds and religions as equally false and
dited superstitions." Some of the papers appear to have
lectures delivered to a class or popular audience, and have
been fairly interesting and useful in giving sketches of the
Creeds and Philosophies of the Ancient East, or of the
mythology and the drama of Greece. A great part of the volume
is made up with extracts from translations of Aeschylus,
Sophocles, and Plato; and the frequent and repeated blunders in
the spelling of proper names, and in various minor details, either
lead to the inference that the author's scholarship is taken at
second hand, or show great carelessness in putting the papers
into shape. A writer who exhibits so entire a confidence in his
own opinions as Mr. Marshall should study a little more accuracy
in his manner of expressing them; and it is not difficult to
conjecture why these "Popular Notes" are only published "for
the author."

Mr. Charles Tovey, who has had "a commercial intimacy" with
the wine trade for half a century, and travelled through the prin-
cipal wine countries of France, making inquiries, has produced a
revised edition of "The Wine Countries of France," describing
the different wines with their areas of growth and specific quali-
ties. In the preface he expresses his opinion that the wine trade
has been injured by the introduction of unscrupulous traders,
grocers' wine manufacturers, who supply dealers who
have no knowledge of the trade, and merely sell whatever is sent
them. He mentions that in a recent price list he saw an "Elbe
sherry" at 15s. per dozen, recommended as a "light stimulating
wine, particularly free from acidity, and, taking into consideration
its strength, cheaper than beer or any other ordinary beverage";
and on testing it found its strength by distillation to be 62 under
proof, i.e., 38 per cent. of proof spirit, and "as to acidity just as free
from that vice as whisky, which can be had from the same firm,
33 per cent. under proof, for 1s. 10d. a bottle." In the latter case
there is, Mr. Tovey calculates, a profit of 22 per cent., and in the
former of 66 per cent.

Mr. J. Longmuir has made a curious slip in the title of his
book. He calls it a *Rhythymical Index*, and explains on the
title-page that it is an index "to all the perfect rhymes of a
different orthography, and allowable rhymes of a different sound,
throughout the language." It would seem, therefore, that Mr.
Longmuir confounds rhythm with rhyme, for there is nothing in
his work about the former. As to the "allowable rhymes" which
he admits into his collection, and of which he gives examples
from "our best poets," they are in most cases not rhymes at all,
but a mere evasion of the obligation.

Mr. Gustave Masson has written a short guide to French litera-
ture, reviewing its leading features and typical characters in a
brief, but pithy and comprehensive, manner. The manual also
contains a chronological table and a list of characteristic specimens
of the chief French writers. Altogether, it is a very complete
little volume. Mr. Masson has also edited Victor Hugo's
Hernani, and Mésleville and Duverrier's *Michel Barrin* for Messrs.
Dulau and Hachette's *Théâtre Français du XIX siècle*. Other
plays by Delavigne, Lebrun, Bonilly, and Sandeau also form
part of this series.

Maps and other works relating to the war continue to appear.
Messrs. Waterlow's small twopenny pocket-map deserves notice
on account of its especial handiness and convenience, as it might
easily be carried in a waistcoat pocket or purse, and also for its
clear and comprehensive delineation of the area of military
operations. It further contains a useful survey of the strength and
armaments of the European Powers. Mr. Mackay's *Handbook* gives
a concise and popular account of the negotiations preceding
the war, the military and naval forces of Russia and Turkey, the
course of the campaigns on the Danube and in Asia as far as they
have gone, together with topographical information, and a map.
Messrs. W. H. Smith & Son have published a new edition of their
war map, with an enlarged plan of the Danube. Messrs.
Weldon also publish penny and twopenny war maps.

Mr. Tovey has collected some interesting particulars as to the
religion of the native Africans, including their conceptions of a
Supreme Being, good and evil spirits, fetichism, and so on, in regard
to which the Africans appear to be in much the same superstitious
state of mind as other uncivilized tribes. The writer, however,
thinks that their belief in the existence of supernatural spirits
and influences may be regarded as a form of religious belief in its
lowest stage, which suggests possibilities of spiritual advancement.

The reappearance for the season of Mr. Watson-Lyall's monthly
Sportsman's and Tourist's Guide to the rivers, lochs, moors, and
deer forests of Scotland will awaken in many minds thoughts of a
pleasant and invigorating holiday in prospect. It gives all the
necessary information as to railway, steamboat, and coach
travelling; a list of shootings, with the names of the owners and
agents, nearest post-towns, rent, &c.; and a description of the
rivers and lochs, with particulars as to how to get to them, and
how they can be fished by strangers; where quarters can be found,
and a mass of other information indispensable to sportsmen and
tourists.

Mr. Mollison has put together some practical directions for
the cultivation of flowering and foliage plants in windows and
glazed cases, which is now so much in fashion, and also for the
arrangements of plants and flowers in the body of the house.
Mr. Quin's *Garden Receipts* conveys, in a compact form, useful
information as to the way of dealing with the various insects
and other pests which are the great trouble of gardeners. Mr.
Stackhouse also has a handy little book on hardy plants for
little front gardens.

Messrs. Cook have published an entirely new edition of their
Guide to Holland, Belgium, and the Rhine. It is of a very handy
size, and contains perhaps as much information as a Cook's tourist
is likely to want.

Mr. Marshall describes his "Popular Notes" as the "result of
various papers" which he has "strung together"; and adds that he
"has been motivated in putting them into shape by having encountered
in society and current literature opinions more or less pronounced

THE WAR.

LORD SALISBURY'S speeches in the House of Lords and in Merchant Taylors' Hall, and Lord DERBY'S adoption of the declarations of his colleague, will perhaps satisfy Mr. GLADSTONE himself that the Government has no intention of plunging into a precipitate war with Russia. Lord DE MAULEY must console himself for the ridicule with which Lord SALISBURY treated his modest suggestions by the reflection that anxieties of another kind will have been relieved by an ironical and contemptuous deprecation of war. There may possibly be alarmists who, as Lord SALISBURY says, are afraid of Russia because on a small map they can put a finger on Russia and a thumb on India. It may perhaps hardly have been worth while to protest against the random conclusions of ignorance; but it is true that the sources of the Euphrates are not near the upper waters of the Indus. It is not the less certain that the extension of Russian dominion in Asia is to be regretted, though it cannot at present be conveniently opposed. In the words of CANNING, quoted by Lord DERBY, if war must come sooner or later, it is better that it should come later; and then perhaps it may not come at all. It is not surprising that the Russian Government declines, except in one instance, to limit the scope of its expected conquests. The Suez Canal, which is practically out of reach, will not be interfered with as long as the present Russian policy remains unchanged. No promise has at any time been given with respect to Asia, and the Moscow professions of moderation in Europe are not repeated. The danger of a collision may perhaps be postponed by the great expenditure of resources which is the necessary consequence of the ambitious policy of Russia. Although it is proved by repeated instances that aggressive Governments are seldom deterred from war by want of money, the vast armaments which are now in motion in Europe and Asia must impose a heavy burden on Russian finances. The enormous fine which was levied by the victor in the last great European war has perhaps increased the temptation to engage in similar struggles; but Germany had the good fortune to overpower the richest nation on the Continent, whereas Turkey will be insolvent even before a total defeat. An indemnity for the expenses of the war would be practically paid by the subject population which is supposed to be the object of disinterested Russian benevolence.

The reports and rumours of the last few days throw little additional light on the prospects of the campaign. There are no means of estimating the importance of a check which the Russian vanguard has received in the neighbourhood of Olti; nor is anything known of the progress of the siege of Kars. The insurrection in the Caucasus seems not to have been suppressed; but it is not likely to affect directly the operations in Armenia. The difficulties of an advance through a rude mountain district may easily be understood; but, on the other hand, the Russian commanders are probably prepared to encounter obstacles which they thoroughly understand. The present enterprise was undoubtedly designed long before the time and occasion of a war of conquest was known even by the Government. It was not necessary to invent any special cause for a quarrel which was certain to occur as soon as diplomacy allowed Russia to engage in a single-handed war with Turkey. It is not improbable that when Kars, Batoum, and Baku are taken, the invading army will pause to consolidate its conquest. The subjugation of the remainder of Asiatic Turkey may well be

deferred to some future occasion. The Armenian part of the population may perhaps prefer Russian to Turkish dominion, and the inhabitants will not resist against an irresistible power. The possession of Batoum will become valuable when, as a probable result of the war, the Russians recover their maritime predominance in the Black Sea. The inconvenience of the present superiority of the Turkish fleet has been seriously felt during a few weeks of war; and probably the Russians would have experienced heavier losses if the enemy had not, with abundant folly, interfered with the enterprising designs of the foreign Admiral. It would seem that an almost desperate condition of affairs has not impressed on the Government of Constantinople the necessity of entrusting the conduct of political and military business to competent persons. The War Minister is, unless he is grossly calumniated, incapable of conducting a struggle on which the existence of the Empire depends; and none of the generals in the field have hitherto displayed ability or enterprise. On the first declaration of war the Turkish army might, without risk or extraordinary exertion, have crossed the Danube, broken up the railway by which the Russians have since advanced, and compelled the Roumanians to surrender all their military stores. Two or three weeks of moderate activity would have insured as many months of immunity from invasion; but the opportunity was neglected, and it will not recur. It is true that the Turks sometimes display unexpected energy after long neglect. It seems that the Montenegrins, who last year obtained almost uninterrupted success, are now hard pressed by a force much diminished in numerical strength. The gallant little tribe of highlanders can ill afford to lose any considerable part of its scanty numbers.

As the Russian invasion proceeds, new complications will arise on the Southern frontier of Turkey and in the islands. The Greeks made no secret of their intention to take their share in the anticipated division of Turkish territory. Prudent statesmen have long regretted that the kingdom was not in the first instance extended by the addition of Epirus and Thessaly to its present dominions. The question of also including Crete was complicated by the difficulty of dealing with a considerable Mahometan population; but the main reason for restricting the area of Greek independence was that the English Government regarded with disfavour the partial dismemberment of Turkey, while Russia distrusted the Greeks as possible rivals for the possession of Constantinople. There are strong reasons for believing that the jealousy of Russia was better founded than the hesitation of England; but those who have had practically to deal with Eastern policy may be excused if they have sometimes erred in conjecture and speculation. During the Crimean war it would have been impossible to allow Greece to create a diversion in favour of Russia; and the discouragement of the Cretan insurrection at a later period was excused or justified by reasonable fear of the commencement of a general war. The politicians who have most vigorously supported the claims of Greece are the same who have suggested the chimerical scheme of protecting the integrity of the Turkish Empire by establishing a belt of semi-independent States on both banks of the Danube. Since it has been proved that Roumania and Servia are, for political and military purposes, mere outposts of Russia, doubts may be entertained whether Greece would by any attainable increase of territory become strong enough to assert a policy of its own. Some

credit may be attached to the uniform statement of English travellers and residents that the Greeks dislike the Slaves in general, and the Russians in particular, even more heartily than they abhor the Turks. Alone among the races which inhabit South-Eastern Europe, the Greeks are conscious of superiority in civilization and in general capacity to the probable conquerors of Turkey. Their intellectual aspirations and their commercial activity would be crushed by the levelling despotism of Russia; but it is nevertheless not yet certain that after the destruction of Turkey they would be able to maintain their independence.

The Government of Athens has much reason for anxiety between popular pressure and the grave danger of war. By land and by sea the Turks are far more than a match for the Greeks, if they are disposed to withdraw any considerable part of their force from the more dangerous contest with Russia. The Greeks have no considerable army; their pecuniary resources are small; and their mercantile marine might be exposed to heavy losses from Turkish cruisers. An insurrection in Epirus, supported by volunteers, and perhaps by regular Greek troops, would cause great embarrassment to the Porte; but the result might be defeat and counter invasion before the Russians were able, if they were willing, to aid their officious allies. Montenegro seems not unlikely to afford a fresh illustration of the old fable of the dwarf and the giant; and the Greek Government is unfortunate in the weakness which prevents it from restraining warlike agitation. When the inevitable rupture occurs, greater sympathy will be felt in England for the Greeks than for any other of the unprovoked assailants of Turkey. Their natural ambition will not be attributed to Russian intrigues, though the diversion which they would effect would necessarily benefit the Northern invader. Although during the half-century of the existence of the Greek kingdom there has been some collision of Greek and English policy, the good offices which have from time to time been exchanged have established an intermittent feeling of good will. After the abdication of Otto the Greeks unanimously offered their Crown to an English Prince, and the courtesy, though it was declined, produced a substantial acknowledgment in the cession of the Ionian Islands. None of the candidates for the succession to Turkish supremacy would be so unobjectionable.

THE LAW OFFICERS.

THE Report of a Committee over which the MASTER of the Rolls presided to inquire into the mode in which the Law Officers are remunerated is worth reading as a curious illustration of the odd way in which public business is conducted in England. About six years ago it was arranged that for the future the Attorney-General should receive a fixed salary of 7,000*l.* a year, and the Solicitor-General a fixed salary of 6,000*l.* a year, for non-contentious business, and should also receive fees when they had to go into Court, or had to do something connected with proceedings in Court. This sounds a simple arrangement, but practically it has led to many difficulties. The Law Officers could not make out what was meant precisely by non-contentious business. For example, a suit to which the Crown was a party was compromised, and the Attorney-General, who was requested to settle the deeds by which the compromise was made binding, was informed to his surprise that this was a non-contentious piece of business. No Law Officer appears to have been in the least grasping, or desirous to be paid fees to which he was not entitled; but they all naturally wished to know what was the principle on which business was pronounced to be, or not to be, contentious. It was entirely in vain, however, that they asked for information. There is the strongest jealousy in each department of State of all other departments, and the Treasury treated the Law Officers as its natural enemies, who were to be kept at bay as long as possible. When a Treasury Minute was asked for by one Attorney-General, for a long time he was kept off, and could not get at the Minute at all, and then he only succeeded in seeing half of it. When another Law Officer asked the department from which a set of papers came what had been done previously in cases bearing on the point to be determined, the department calmly answered that it would not tell him, and he might find out for himself. It seems at first almost inconceivable that the Law

Officers can be treated in this way. They are persons of importance, they are asked for advice on matters of great moment to the nation, and as to which the holders of office are deeply concerned in getting correct and speedy answers, and they always belong to the political party to which the chiefs of the great departments of State belong. It might have been expected that they would be in an especial manner the pets and favourites of the different departments, that everything that could be done to assist them would be done, and that every information they wished for would be given with cordial alacrity. But the traditions of English bureaucracy are far too deep-seated and permanent for the temporary holder of any of the chief offices to overcome them; and one of the most powerful and persistent of these traditions is that each department has to work for itself, and fight a ceaseless battle with all other departments. When the Attorney-General who could not get the Minute he wanted at last got hold of the Chancellor of the Exchequer on the subject, he got the Minute at once; but even then a second Minute on the same subject was withheld from him, because, as he was not aware of its existence, he could not ask for it. But, in the ordinary routine of business, a Law Officer cannot get at the Chancellor of the Exchequer. He must address the Treasury, and it is the business of the Treasury to baffle and outwit him, just as it is the business of the Treasury to baffle and outwit all the world outside the Treasury. It may perhaps be a comfort to the unhappy portion of the British public which has had to do with Government departments to find that even such great people as Law Officers share the common fate, and are sat upon and put off and humiliated just like ordinary people.

The plan of paying the Law Officers by a fixed salary for non-contentious business offered the departments an opening for taking an advantage of the Law Officers by which they were not slow to profit. It was obvious that, if the Law Officers were properly flooded with non-contentious business, they might be crushed and harassed in a way calculated to afford their adversaries in the departments the most lively satisfaction. There was no end to the papers that might be sent them; and the ingenious device was hit on of sending papers without the slightest clue being given to the reason for sending them. The Foreign Office, or at least the Foreign Office in Lord GRANVILLE'S time, appears to have been the greatest offender in this way. Piles of papers used to come from the Foreign Office with a mere intimation that Lord GRANVILLE would be glad to know what the Law Officers thought about them. The Law Officers had of course to read them, or skim them, and then generally found out that there was no question whatever of law involved. They were not invited to give their opinion on a question of law, but to find out whether there was a question of law, and, if so, to say what their opinion was. They had, in fact, to do the work of clerks in the Foreign Office before they could see whether they had any work of their own to do. A more complete waste of the time of public servants cannot be conceived; but it was of course a great departmental triumph, for the Foreign Office could enjoy the thought that it was taking their salary out of the Law Officers and giving them as much trouble as possible. Custom, too, has so arranged the mode in which the Law Officers have to work, that they are left utterly destitute of all machinery for the proper discharge of their duties. Sir WILLIAM HARCOURT informed the Committee that when he was made Solicitor-General, two cabs drove up to his door, and out of them a confused mass of dusty papers was tumbled into the street, and he was informed that these were the archives of his office. A considerable part of the duties of the Law Officers refers to patents, and they come into office new to the work, and want, above all things, to be told what is the practice in routine cases. When Sir WILLIAM HARCOURT came into office there was only one man alive who was supposed to understand this practice, and he had been a clerk of Lord COLERIDGE. "I was obliged," as Sir WILLIAM HARCOURT informed the Committee, "to secure this man upon whatever terms I could. I got him for about six weeks, and then he obtained another appointment elsewhere; after that there was of course no one who knew how to do the work." There is no country in the world where such a thing could be possible except England; but in England the proper organization of a branch of the public service may be delayed for

centuries so long as a certain amount of work is practically performed and powerful persons do not complain. The Law Officers are, as a rule, men of great ability and industry, and however much they are harassed, they can contrive to do a great amount of useful work. On the other hand, they occupy a high position and earn a very large income, and they do not feel much disposed to tell their griefs to the world. It is only by accident that all that Sir WILLIAM HARCOURT had to endure has been made known to a pitying public. Even now that the true state of things is known, it is much more likely that the mismanagement which inconveniences the Law Officers will not be remedied than that it will. It will very probably be treated, not as an injury to the public service, but as a nuisance touching one or two individuals, who are paid very liberally not to mind it.

The fundamental notion of English bureaucracy, that each department is to look on all other departments as outsiders, sometimes leads to odd and unexpected consequences. The Foreign Office, for example, is most careful to preserve a proper amount of secrecy as to the contents of important documents. When they, or copies of them, have to be sent for the consideration of the QUEEN or members of the Cabinet, they are sent in boxes carefully locked, by the hands of trustworthy messengers, whose fidelity is recompensed by a good salary. But when such documents are sent to the Law Officers, then the Foreign Office washes its hands of them. It has got to send them to outsiders, and its responsibility is at an end. No precautions are taken to see that secrecy is preserved. Sir WILLIAM HARCOURT says that he always got his Foreign Office papers in an open envelope. It is supposed that it was from information obtained from this want of secrecy that the *Alabama* escaped, and, if so, the absence of a locked box may be said to have cost the country three millions sterling. Whether the carelessness that prevailed a short time ago prevails now it is impossible to say from the evidence given to the Committee. It was the business of the Committee to report on the salaries of the Law Officers, and they could not call witnesses to enlighten them on the irrelevant question whether Lord DERBY supplies enough locked boxes. It is obvious that one Minister will do things which another will not, and that many of the shortcomings or grievances of which Law Officers have to complain under the reign of a Secretary may disappear under the reign of his successor. Very possibly Lord DERBY may order his papers to be read through in his own office before they are sent to the present Law Officers, and they may be fortunate enough to be told beforehand what are the legal points on which their opinion is wanted. Different departments, too, have different traditions. It is notorious that no department is better managed, or under different Governments has been better managed, than the Colonial Office. It is not at all likely to send papers at haphazard and ask the Law Officers to read them through on speculation. It may also be added that, on the whole, England is very well governed. The very aversion of one department towards another is inspired by the zeal with which it performs its own duties. And if it could be wished that civility accompanied zeal to a larger extent than it does, this is not true of the political chiefs, who, as a rule, are uniformly courteous; and as to minor officials, it must be remembered that zeal and civility very rarely go together in official circles. No bureaucracy is so well organized as the Prussian; but few non-official Prussians can boast of having had a happy time when they have got inside a public office. There is much to admire, and not much to blame, in the official administration of England; but it has its weak points, and perhaps its weakest is that which the evidence taken before this Committee reveals, the want of co-ordination among the departments as parts of a common whole.

ETHNOLOGICAL POLITICS.

OF the many fanciful theories which have at different times produced political results, the doctrine of ethnological unity is one of the most gratuitously absurd, though, happily, it may be not the least effective. Potentates or statesmen are ready-made formula which unite their

and practical deductions. The Czech agitators of Prague might perhaps have been, as at present, disloyal to the Imperial Government of Vienna, if, like their ancestors, they had been wholly ignorant of their supposed kinship with the Russians; but scholars and pedants have for the most part unintentionally provided them with a high-sounding excuse for treason. Students of language have ascertained that the nations which speak various Slavonic dialects diverged from a common stem at a later period than that of the first dispersion of the original Aryans. Some thousands of years ago Czechs and Russians may have belonged to the same tribe, whereas Slaves and Teutons require an additional lapse of time to be assumed as having obliterated or obscured their primeval identity. The various ramifications of national pedigrees furnish no obvious reason for basing political connexion on comparative philology or on conjectural genealogy. The ambition of kings and conquerors, the seditious propensities of malcontents, adulation of power, and indifference to freedom, were known long before modern ethnology was invented; but there is perhaps some satisfaction in devising scientific methods of justifying selfishness and turbulence. Though the Czechs and the Russians cannot understand one another's language, their dictionaries and grammars present a certain resemblance which is adopted as a pretext for treasonable intrigues. A strange peculiarity of the Bohemian agitation in favour of Russia consists in the absence of ecclesiastical associations. While Russia assists the Bulgarians from religious as well as ethnological sympathy, the Bohemians, without exception, adhere to the Western schism. The convenience to ambitious potentates of having two strings to a bow could not be more forcibly illustrated. As lately as the Crimean war, Russia was moved wholly by theological considerations to help the Christian subjects of Turkey. The quarrel was first contrived through a squabble of Greek and Latin mobs at Jerusalem; and in all the diplomatic documents of the time rayals of every origin and language were compendiously designated as Greeks. Since that time the doctrine of Slavonic unity has been preached by pedants and adopted by political associations; but it is only with the present year that the Emperor ALEXANDER has publicly professed to be the champion and the leader of the Slaves.

The scandal which has occurred at Prague began with a discourse delivered by the President of the Slavonic Society of Moscow on the duty and the right of the Emperor of RUSSIA to represent and govern all the various branches of the common family. It seems not to have been altogether prudent to revive in the memory of the Austrians and Germans the predatory and subversive doctrines of General FADAEFF. Every speech and every pamphlet delivered or published in Russia has a negatively official character, inasmuch as it has not been disapproved by the censor; but the Austrian Government would not have troubled itself with Russian provocations if the agitators of Prague had not responded to the invitation to revolt. The Czech answer to the communication of the Moscow writer was an audacious expression of personal and political devotion to the Emperor of RUSSIA. The abundant flourishes of the address were copied from hackneyed precedents. Since Slavonic declaimers took to boasting of their national qualities, the bluster of French and Spanish rhetoricians in former times has been outdone. Russian pedants have discovered that barbarous rudeness is youthful vigour, and that the Slavonic races which have neither a history nor a literature are qualified and prepared to supersede the effete nations of Europe. Their destiny can only be accomplished by subordination to the policy of the great Slavonic Empire. Having helped to exterminate the Turks, the Czechs may perhaps be rewarded by the overthrow of the supremacy of the hated Germans. The agitators might perhaps have been allowed to talk nonsense with impunity if they had confined themselves to inflated metaphor and to obscure prophecy; but in the present instance the instigators of sedition were imprudently plain spoken, and some of the leaders were consequently apprehended on a charge of treason. The most serious charge has since been withdrawn in deference, according to one improbable report, to the representations of the Russian AMBASSADOR. It is incredible that the Russian Government should wantonly offend a Power to which 300,000 hostages will be given as soon as the invading army crosses the Danube. The Russian AMBASSADOR in Vienna may perhaps have rendered the prisoners a ser-

by disclaiming all sympathy with their language. The time for inviting the Austrian Slaves to accept Russian protection has not yet arrived; but the theory which has been proclaimed at Moscow and at Prague will be long available for purposes of mischief.

The ethnological system of policy originated about sixty years ago in Germany, though it was for the time confined to literature. Napoleon had reminded the Germans by his tyranny of the national existence which had been almost forgotten during the last days of the Holy Roman Empire. At that time it suited the purpose neither of Prussia with its Polish subjects, nor of Austria, which was an Empire including many races and languages, to adopt the theory that political unity depends on similarity of descent and of language. France and Russia had German subjects, and Poland and Italy were governed by aliens. England ruled a French population in Canada and in Mauritius, and Norman subjects in the Channel Islands; there are Dutchmen at the Cape, and there are even a few Germans in Heligoland. The great national revivals of more recent times were not founded on chimerical and prehistoric pretences of kindred. Germany had nominally ceased to be a kingdom only in the present century; and under the government of its six-and-thirty princes, free interchange of allegiance and public service was always customary. Above all, the German race possessed a common literature and a language which was spoken with comparatively little variation from the Baltic to the Alps. In Italy, also, national consciousness had survived from the days of DANTE and from an earlier time, and the Italian literature was even richer than the German. The Slaves have written nothing, unless the Servian ballads may be regarded as literary compositions; for it is not worth while to mention Russian fictions which are either imitations of second-rate French novels or perhaps faithful pictures of a society which, if the representation is accurate, must, according to the well-known phrase, have become rotten before it was ripe. If a Czech in the intervals of seditious agitation wishes to recreate himself with a book, he will certainly not resort to the scanty Russian catalogue.

The pretexts of Russian ambition are exactly the same with those which served the purpose of NAPOLEON III. when he designed imprudent enterprises. To the geographical figment of natural boundaries which was universally popular in France, the late EMPEROR added reasons for conquest which were founded on connexion of dialects. He aspired to be the head of the Latin races, consisting of the nations which use various Romance languages; and he even by a bold fiction classified the Mexican Indians as Latins because they talk a corrupt form of Spanish. Belgium was covered both by the philological and the geographical formula; but it has hitherto escaped annexation to France. It was not that time foreseen that BISMARCK and MOLTKE might in their turn study national genealogy, with the natural result of reclaiming Alsace and Metz from France. Low Dutch and High Dutch are as nearly related as Bohemian and Russian; yet Holland has no desire to be swallowed up by Germany. Philologists may even dispute whether between Schleswig and Jutland a district cannot be found which ought on ethnological principles to be annexed to England. It is unfortunately impossible to persuade the Americans, though they are English, to resume the allegiance which was renounced before the invention of ethnology. A century hence the English language will probably be spoken by a hundred and fifty millions of descendants from the original stock; but nothing can be more improbable than that the nation should form one political community. Even if the Slaves were really one nation, it is not desirable in the interests of civilization that the most backward race in Europe should by a combination of enormous numbers attain military and political supremacy.

SOUTHERN INDIA.

PROFESSOR MONIER WILLIAMS has recorded, in the shape of a long letter to the *Times*, the impressions he received, the facts he observed, and the conclusions he drew during his recent visit to Southern India. His composition has the unusual merit of being readable. As a rule, publications about India, whether in the form of books, pamphlets, or magazine articles, are of all

publications the dullest and driest to English readers. Nothing can be more wearisome than descriptions of the details of Indian life. People whose names we cannot pronounce live in places we never heard of, and do things in a way which is just one step above doing nothing. To interest and instruct the English public, details about India must be avoided and only general pictures drawn and general results stated. Professor MONIER WILLIAMS has the great merit of understanding this: He knows that anything like a journal of Indian travel is an abomination to the English reader; and, if he kept a journal, he has been far too wise to publish it. It is enough for us to know that he was postured with snakes, and found them in his clothes; and we are thankful to be spared entreaties to picture his horror and astonishment when one morning he was by so forth. He begins by telling us what he means by Southern India, and informs us that it is India within the tropics. He gives us the main divisions of this vast territory, and enables us to form some idea of its vastness by telling us that the dominions of the NIZAM equal in extent the whole kingdom of Italy. He describes the fauna and flora of the region, and inspires us with the notion that Southern India is a grand place, where an Englishman, if properly paid, may be content to live for a few years amid much to admire and wonder at, with many discomforts and with varying health. It appears to be a capital place for a visit of five months in winter-time, as the traveller will be perpetually interested, may animate his spirits, tried by mosquitoes, monkeys, and snakes, with the thought that the visits of intelligent Europeans elevate the native mind, and will be always sustained by the reflection that in a few weeks the whole business will be over. What Mr. WILLIAMS has to say about the plants and animals of Southern India is so condensed that it cannot be abridged. But there are one or two points in his description on which a word may be said in passing. He thinks that the exuberance of animal life which was such a constant nuisance to him has been greatly stimulated by the reluctance of the natives to take away the lives of animals in which the souls of their deceased ancestors may possibly be embodied. No doubt animals whom it would be a comfort to see killed are allowed to live and multiply near the habitations of men. But in the tropics nature as a rule beats man, and the general experience of the world shows that man can do very little to extirpate tropical pests. Mr. WILLIAMS found, for example, more tigers than he expected; but the reason was, not that sportsmen did not wish to kill the tigers, but that the tigers lived in deadly jungles, the air of which kills the sportsman instead of the sportsman killing the tigers. In the next place, when we come to plants, we find Mr. WILLIAMS speaking in a delightfully sanguine way of the future cultivation of tobacco. So bright are the hopes which tobacco awakens, that it is pronounced possible that in time the Government may be able to substitute the growth of tobacco for that of opium. This would be very pleasant. We should keep up the revenue, and at the same time be able to attend to the claims of morality. Perhaps this is too fair a vision to be realized; but still it is always a comfort even in a vision to see the possibility of a time coming when we may at once be good and lose nothing by our goodness.

Man is, however, more interesting to Mr. WILLIAMS than beasts or plants, and the greater part of his letter is occupied with an account of the natives, their character, customs, and religion. As the women are all shut up, with the exception of the wives of the Mahrattis, there is not much to be said of them; but of the men Mr. WILLIAMS speaks in favourable terms. He finds in them indeed, both physically and morally, a lamentable want of backbone; but then, if they had too much backbone, we should hardly be there to govern them. He also made the observation which all travellers find cause to make in all parts of the world, that the average native is in some ways better than the worst European. An English captain, for example, informed him that he much preferred Tamil sailors to English sailors, as they were more docile and did not drink. He might have added that they cost less, and that the Company he served would not have allowed him to employ English sailors if they had possessed every virtue under the sun. The religion of the people, however, chiefly engaged the attention of Mr. WILLIAMS. The population is not purely Hindoo than in Northern India, but especially in the country of the Malabar, the influence of the Mohammedans may be delayed in

appears to have affected the Mahomedans, and Islamism has imbibed something of a Hindoo tint. Mr. WILLIAMS scouts the notion that Mahomedans in India look on the SULTAN as the head of their faith, and says that loyalty to the SULTAN is a pure fiction of political agitators. He may be right, or he may be wrong. The Hindooized Mahomedans of Southern India may never trouble their heads about the CALIPH, while the Mahomedans of other parts of India may either think of him, or be willing to learn to think of him, with reverence. The spread of an idea must begin somewhere; and the important question is, not whether political agitators invented the idea of the SULTAN's claim on the allegiance of the faithful, but whether any large number of people embrace the idea when it is presented to them. Political agitators invented the idea of Home Rule, but the people of Ireland accepted it. Other political agitators invented the idea of Pan Slavism, but some at least of the Slavonic nations have taken up this idea in earnest. So far as can be seen at present, the feeling of allegiance to the SULTAN has a feebler hold on the Mahomedan world than might have been expected. Mahomedans who are free to choose seem no more inclined to make common cause with Turkey than the Christian world is inclined to make common cause with Russia. In India generally there are no apparent signs of any very vital interest on the part of Mahomedans in the fortunes of Turkey. The enthusiasm which prompts subscriptions to help the penury of the Turkish treasury falls very far short of the enthusiasm which collects PETER's pence. If the Mahomedans in India could turn us out of the country for their own benefit, they would no doubt be delighted to do so; and if they ever think they have an opportunity, they will be sure to use it; but whether, to all the other motives which impel them to enmity towards us, they now add a soreness of feeling at our desertion of the CALIPH, is a point on which we have no evidence of a trustworthy kind.

The essence of the Hindoo religion is propitiation. The native mind has a practical turn, and wishes to attain a definite purpose in its sacred rites. It is willing to go through any amount of trouble in its observances, if some clear gain is to be got by the process. The clearest gain that the native mind can picture to itself is the averting of evil. And its fertile fancy has been set to work to imagine all the sources of evil possible. Every conceivable calamity is attributable to some evil agency, either a god, or a devil, or a deceased man. There are good agents on the other side, and they may be propitiated to fight against the bad agents. In a dim way they recognize a Supreme Being; but they argue that he is too good to hurt any one, and so he may be left out of the account. With this exception, everything that produces the notion of power is worth propitiating, the propitiation consisting in depositing little offerings of food or of anything that the agent, if alive and in human shape, might be conceived to like. Thus on the tomb of one English official, who had terrified them during his life, the natives, as Mr. WILLIAMS informs us, deposited little offerings of brandy and cigars, hoping that he will still like these luxuries as much as he used to do, and that as long as his spirit could smoke and drink it would not occupy itself in annoying them. Again, offerings were deposited on the tomb of another Englishman who had in life been famed for shooting tigers, in the hope that his turn for worrying tigers still survived and might be somehow put to good account. Naturally enough Mr. WILLIAMS concludes by asking how these imaginative millions, with their docility and want of backbone, may be improved and enlightened. He sees how they might be made Roman Catholics after the pattern of the Catholic Indians of South America, as the change they would have to undergo would not be very great. But how are they to be brought up to the level of English good sense, right feeling, and enlightened Protestantism? Mr. WILLIAMS pronounces that the only means of attaining this desirable end is to carry out three changes. There must be "a complete reorganization of the social fabric, a new ideal of womanhood, and an entire renovation of family life." It may cheer his readers to find that Mr. WILLIAMS does not consider this a work of hopeless magnitude; but some degree of despondency is inevitable when it is discovered that one of the means he proposes, which he relies is the creation by the Government of a strong and sound middle class, is a constitutional absurdity.

taught us to reverence and love, and almost worship, the middle class; but it may be safely said that, if the British invent a new ideal of womanhood, the middle class will shine forth with a glory that has hitherto been unknown.

CLUB GOVERNMENT.

SIR GEORGE BOWYER probably forebore that his question to the ATTORNEY-GENERAL on the lawfulness of the Birmingham Federation would not receive a serious answer. The statute which makes the institution of an Parliament illegal was passed under circumstances which have now become obsolete, when seditious bodies in England were conspiring with national enemies for undoubtedly treasonable purposes. The mischief which Mr. CHAMBERLAIN's scheme tends to produce is of a different kind, and it is not to be averted by criminal prosecutions. It matters little whether the Conservative Associations to which Mr. CHAMBERLAIN compared the Birmingham cluster of Clubs are similar in their organization to the new Federation. If they really bring large numbers of persons under the habitual control of delegates or any other kind of demagogues, Mr. GORST and his friends are, in proportion to the activity and success of their efforts, no less blameable than the political managers of Birmingham. Government by Clubs is still as incompatible with constitutional freedom and with Parliamentary supremacy as when it was established in typical perfection by the Cordeliers and Jacobins of the French Revolution. There is happily no reason to fear that Mr. CHAMBERLAIN will institute a Reign of Terror, or that Mr. GORST will in turn emulate the reaction which is denounced by democratic historians as the White Terror; but the Liberal Federation for which Mr. CHAMBERLAIN has cleverly contrived to make Mr. GLADSTONE responsible is professedly established for the purpose of dictating to Parliament, and of securing the permanent supremacy of a single faction. In the well-known and innocent pastime of "Beggars my neighbour," children take their first lessons in fraud when they learn surreptitiously to pack the court cards in a manner which is prohibited by the rules of the game. In politics the process is described as organization, and either player apologizes for his illicit practices by pretending that the trick had been anticipated by his adversary. Packed elections may not be proper subjects of prosecution, but they tend to establish an oppressive system of monopoly and exclusion. Independent thought and conscientious preference of public interests vary inversely with the prevalence of political organization.

Mr. CHAMBERLAIN's federated Clubs, radiating from Birmingham as their centre, may perhaps be copied from the celebrated mother Society of the Jacobins, with its affiliated Clubs in every town and village in France; but in practice the result will be American vulgarity and corruption rather than French ferocity of persecution. If the proposed organization proves to be effective and permanent, the Council of Delegates will dictate to the local bodies the objects to which from time to time their pernicious activity will be devoted. Any independent politicians who may decline to submit to the central authority will incur the penalty which is known in the United States as "being read out of the party"; and the involuntary seceder will thenceforth, as far as the power of the Federal Club may extend, be excluded from Parliamentary and municipal honours. If Mr. CHAMBERLAIN's policy is adopted, the entire faction will in the first place concentrate its energies on the destruction of the Church Establishment. There will be no difficulty in securing a majority of the primary assemblies and of the delegates in favour of that or any other subversive measure; and when it is once adopted, the organized force of the associated Clubs will be directed to the attainment of an object which is nevertheless disapproved by a large section of the Liberal party. Public opinion would be far more truly tested by Parliamentary elections conducted after the old fashion with reference to various political issues. It is no consolation to the supporters of constitutional government to be told that the vicious system of the Birmingham Clubs will be adopted on the other side by Conservative associations. A contest of two sharpers is not a legitimate game. It was no compensation for the penal laws against Catholics in Ireland that Protestants were at the same time more cruelly persecuted in Spain and Portugal.

Conservative Inquisition in Liverpool would not be a set-off against the Radical Inquisition of Birmingham.

The organization of factions in America which is to be imitated or reproduced in England has attained, and probably passed, the most vigorous and most pernicious stage of its existence. The system of jobbery which has in the Northern States become almost its only instrument and motive is likely to be impaired or overthrown by some measure for the reform of the Civil Service. Legislative and judicial posts will probably long be distributed by political managers, and perhaps the several States will hesitate to adopt the practice of a permanent tenure of office, even if the example is set by the Federal Government; but it will be an evil day for Republican and Democratic manipulators of votes when the Post Office and the Custom House cease to be used for purposes of corruption. Experience will show whether it is possible to maintain the discipline of factions when the number of prizes is largely diminished. In the United States parties are not for the most part divided by any intelligible difference of principle. A man is a Republican or Democrat chiefly because he takes a pleasure in securing majorities for the side to which he has accidentally attached himself. At present divisions of parties in England are deeper and more real; and it is possible that political passion may maintain the vitality of Clubs and Unions with the aid of the municipal and Parliamentary patronage of which their leaders may be able to dispose. American managers have no Church to disestablish; and universal suffrage already prevails. It would not be worth while to tamper with the laws affecting land in a country where the supply exceeds the demand, and where landowners have consequently no chance of finding tenants. Even if Mr. CHAMBERLAIN'S present programme were exhausted by success, there would still be the House of Lords and many other institutions to demolish. American democracy has long since completed the conquests which still attract the ambition of revolutionary politicians in England. The creation of a dead level among a population of which the greater part lives on wages will be a dangerous and novel experiment.

No imputation on the ability of Mr. CHAMBERLAIN and his associates is conveyed in the expression of a doubt whether they have not already made some mistakes. The device of obtaining Mr. GLADSTONE'S sanction to the ultra-Radical movement, at the cheap cost of sympathizing with the Bulgarian agitation, was ingeniously conceived and skilfully executed; yet it is doubtful whether Mr. GLADSTONE has not lost by the alliance as much as Mr. CHAMBERLAIN has gained. In deepening and widening the rent which previously existed in the Liberal party, Mr. CHAMBERLAIN has at least temporarily added strength to the Conservative cause. It may be admitted that the adhesion of Mr. GLADSTONE to the new Liberal organization is an equivalent for considerable sacrifices. A more doubtful measure is the identification of the Birmingham movement with the social jealousies of Nonconformist ministers. The Dissenters have for some time past incurred the risk of offending their political allies by affecting to control and represent the Liberal party, of which they undoubtedly form a powerful section. Their effective co-operation with the Secularists in excluding religious teaching from elementary schools might have been regarded as a popular proceeding if the example had been followed by other towns, and had not been restricted to Birmingham. The actual power of the Nonconformists cannot be accurately estimated, and it probably varies with circumstances; but in England there has always been a prejudice against clerical influence in politics, and possibly the federated Liberal associations may find themselves weakened by the sectarian element which they contain. A not less wholesome jealousy has in former times checked the attempts of busy politicians to acquire more than their share of power by means of the organization of Clubs. Mr. CHAMBERLAIN'S political associates, except the Club-law League, have for some years after its object had been accomplished, the purpose of controlling the country and the Government. After one or two unsuccessful attempts, the managers have been gradually produced, and the result of assigning to two different sections of the Birmingham district of the seats for Liverpool and Manchester. The movement was rewarded by the conversion of Lancashire into a Conservative country; and after more than twenty years the country continues. It may be asked what the Birmingham

Club and its branches will be met by similar resistance in its efforts to extend over the country the intolerant system which it has established at home.

MEETING OF THE FRENCH CHAMBERS.

THERE is not much field for speculation in the fact that the French Chambers meet again to-day. The course of events is clearly marked out. The Opposition are bound to attack the new Government in the Chamber of Deputies the moment that the opportunity of speech is restored to them, and both the attack and the defence will suffer somewhat in interest from the vote of the Chamber being known beforehand. Politicians of the class to which the conduct of affairs is now entrusted will not be much troubled by a vote of want of confidence. That a Minister should be trusted by the Chamber of Deputies is in the eyes of Marshal MACMAHON conclusive evidence that he has no business to be Minister. But even a reactionary Cabinet cannot escape the humiliating necessity of raising money; and the defeat that awaits the Ministers to-day will not relieve them from asking the Chamber to vote the Budget next week. But for this they would probably be content to set the favour of the Senate against the dislike of the Chamber of Deputies, and to postpone a general election until some chance incident seemed to give them a better promise of success. But as the Chamber which has money will not give it, and as the Chamber which is willing to give money has none to give, the Cabinet will have no choice but to ask the Senate to concur with the MARSHAL in dissolving the Chamber of Deputies. For the present, the MARSHAL seems chiefly anxious to make sure that the Senate shall not refuse this request. The report of his speech to the Legitimist delegates which appeared in the *Times* of Tuesday makes him say plainly that, if a dissolution is refused him, he will at once resign. This threat will probably be sufficient to defeat any attempts which the Left have been making to dissuade the Senate from precipitating a general election. Without this it is not difficult to conceive reasons which might have moved some wavering Senators to vote with the Left on this question. There must be many weak hearts and feeble knees among the party which professedly supports the new Ministry—many who are divided between their hopes that the Government may be successful in its appeal to the country and their fears that the country will give the same answer that it did before; many who would be cheered by some sign that the MARSHAL was reverting once more to a policy of compromise, and meditated replacing the present Cabinet by one which, if it were a little less agreeable to himself, might be a little less disagreeable to the Chamber. This section of the Senators might be inclined to think that, if only time could be gained, this desirable settlement would not be beyond their reach. The MARSHAL, they would have argued, will not like seeing his Ministers continually beaten in the Chamber, and, when he is convinced that a dissolution is not to be had, he may reconstruct his Cabinet on a somewhat more conciliatory model. By that time the Chamber will be growing weary of barren victories, and may not be disinclined to accept a Cabinet of a highly Conservative, but still Republican, type. In this way the original error of driving M. DUBAISE from office would be atoned for, and matters would go on as though there had been no M. SIMON and no Duke of BURGUNDY. There would have been something to be said in favour of this reasoning, and it might perhaps have led the more liberal members of the Right to vote against a dissolution. The Left would have voted the same way in the hope that the MARSHAL would be too irritated by a defeat in the Senate to remain in office. The MARSHAL would thus have been saved by a coalition between the Senators who thought that it was time it should be no longer matters for coming to any decision, and the Senators who thought that to refuse it would leave no room for any more compromise.

Marshal MACMAHON has declared that his object by giving it the matter another way was to stand no nonsense from the Senate. To be satisfied in the popular Chamber is what every good citizen must expect, but to be defeated in the Conservative Chamber by the Chamber which has been created by a vote of the Senate is a situation which the proper organization of the popular Chamber is sure to delay for some time to come.

of. and will resign his office. This announcement will in all probability make the voting of a dissolution absolutely certain. The Senators of the Left will of course be more anxious than ever to defeat the vote, because the resignation of the MARSHAL without a general election would give them all that they most want. M. THIERS would be elected President, the administration would once more be reconstituted, and a new Cabinet would find itself in harmony with the existing Chamber of Deputies. There would be no more danger of defeat in the elections, of violence on the part of the Executive, of resistance on the part of the Republicans. The schism between the Executive and the country would at once be closed, and closed by a complete and definitive victory on the side of the latter. But the prospect which would look so bright to the Senators of the Left would have no charms for a single wavering Senator on the Right. The Conservatives who would be tempted to refuse the dissolution which the MARSHAL will ask for would be men who wish above all things to retain him as President, though they may nourish an unavowed wish that he were on better terms with the Chamber of Deputies. They regard the resignation of the MARSHAL as the greatest of political misfortunes, and, if they opposed a dissolution, their real reason for doing so would be to ward off collisions which might in the end lead to his resignation. As soon as they see that the refusal of a dissolution will make the MARSHAL's resignation inevitable, the motives which till then might have prompted them to refuse it will operate in the contrary direction. The policy which they had hoped might have averted a resignation is now discovered to be the means of ensuring it. The Senators of the Right will at once see the need of doing as the MARSHAL bids them, and as they command a majority in the Senate, they will be strong enough to give effect to their convictions.

The nearly universal prohibition of public meetings in France deprives us of the natural materials for making even a guess at what the result of the dissolution may be. It is on the cards that the appearance of M. THIERS as a possible candidate for Marshal MACMAHON's place may work a change in the tactics of the Cabinet. If there had been no one capable of convincing the country that no revolutionary measures are in contemplation, they would probably have advised the MARSHAL to make a direct and personal appeal to the electors. Order with the MARSHAL, or anarchy without him, would have been the dilemma laid before the nation; and it is at least possible that, under this pressure, the moderate Republican electors might have preferred to keep the PRESIDENT whom they know rather than exchange him for a President whom they do not know. But if M. THIERS should in effect present himself to the electors as a rival to Marshal MACMAHON, all calculations founded on the timidity of the moderate Republicans may be falsified. The country has never had an opportunity of voting on M. THIERS's name, for when he resigned office in 1873 he had not the power of appealing to it, and when the appeal was at last made in 1876, the Republicans had agreed to accept Marshal MACMAHON as their President. But though there are no data forthcoming from which to divine the vote of the electors upon such an issue, there are many considerations which make it likely that M. THIERS's name would ensure a very large measure of support. If the Duke of BROGLIE is of this opinion, he will naturally be anxious to give M. THIERS no excuse for presenting himself before the country. If the MARSHAL were made to say plainly, "Unless you give my Ministers a majority I shall lay down my office, it would be impossible to hinder M. THIERS from saying, 'If France desires it, I am willing to take up the office which Marshal MACMAHON lays down.' But if the MARSHAL makes no reference to any resignation on his part, M. THIERS cannot with any propriety suggest himself as a candidate for a place which is not vacant. It is impossible for the Left to assume that the MARSHAL will resign if his Ministers are beaten in the elections, because this would be to acquiesce in the doctrine that the PRESIDENT is somehow responsible to the country for the choice of Ministers; and that, if the country censures his choice, it is his duty not to change his Ministers, but to retire from office. Consequently, the country must be decided without any preliminary understanding having been arrived at as to the ultimate consequences of the decision. It is possible that this uncertainty may operate to some degree in favour of the Government. There may be a good number of Senators

sure that M. THIERS would be followed as a matter of course by the resignation of the MARSHAL and the election of M. THIERS, but who may not be prepared to vote against him if the result of defeating him will be to commit the Executive to a prolonged struggle with the Legislature. We do not want to keep Marshal MACMAHON, voters of this type may say, but if we must have him whether we want him or not, we would rather that he had a Chamber which he could get on with than a Chamber with which he will be in permanent antagonism. The probability that a certain number of electors will reason in this fashion may at least prove sufficient to keep all reference to resignation out of the speeches, alike of the MARSHAL or of his Ministers.

THE PUNISHMENT OF DEATH.

THE debate of Tuesday on Mr. PEASE's proposal to substitute penal servitude for life for capital punishment was redeemed from dullness by a single speech. Mr. BRIGHT seldom displays greater force and dignity than when he is directing his powerful rhetoric against this "relic of barbarism." Yet the very statement of the proposed change seems to carry with it its own condemnation. "It is expedient," says Mr. PEASE, "to abolish the penalty of death and to substitute for that penalty in the case of murder penal servitude for life." It is a sufficient answer to this proposal that there is one whole class of murders, and that a class which might easily become very much more frequent than it is, in which the infliction of penal servitude would be virtually impossible. The idea of punishment implies that a man is made to undergo something which he is not undergoing at this moment. But, if penal servitude is the worst thing that a criminal can be made to undergo, what is to be done with a man who commits murder when he is undergoing penal servitude already? Sentences of imprisonment for any less term than life can be made cumulative; the punishment for a crime committed by a prisoner need not begin to take effect until the penalty originally inflicted on him has been worked out. But life sentences cannot be cumulative. The criminal has already been sentenced to all the punishment that he can endure, and there is nothing more that he can be made to suffer. Consequently, if it were made unlawful to put men to death for murder, the temptation to a prisoner already under sentence of imprisonment for life to murder a gaoler he disliked would be almost irresistible. The abolition of capital punishment would have filled our prisons with men who had already been guilty of every form of violent and brutal crime. Men of this stamp have an extraordinary faculty for conceiving intense and lasting hatreds to their keepers. Even the most kindly gaoler is compelled to inflict a good deal of suffering on the prisoners he has in charge. They are often exceedingly idle, and, in one form or another, work has to be exacted from them; they will naturally not love the man who metes out their work to them. If he is just, the worst-conditioned prisoners will dislike him; if he is unjust, the least favoured prisoners will dislike him. The strictest watchfulness cannot prevent a prisoner from finding opportunities of revenging himself for real or fancied injuries. The warders may be well armed, and well trained to use their arms; but they cannot be for ever on their guard against men in whom ingenuity has been sharpened by a long experience of crime and an entire absence of any rival matter for reflection. Sooner or later their vigilance relaxes, and the pent-up passion which has been accumulating for months or years finds an outlet.

Under these circumstances, what is to prevent a prisoner from murdering his gaoler? He will not be restrained by any sense of the value of life, or any fear of the punishment which may await him after death. These are refinements with which he has long ceased to trouble himself. His condition cannot be made materially worse than it is already, for he is in prison for murder and is to remain in prison all his days. As a murderer he is already condemned to the severest and most painful labour which the code of prison discipline allows, so that, unless undue leniency has been shown to him in the first instance, there is nothing more to be done. At all events, there is nothing of a kind which public opinion would allow to be done. In theory, of course, the State might show its merciful disposition by substituting a term of years for death. But Parliament would

though it would be difficult to assign the limits within which the exercise of criminals is allowable, public opinion has a strong tendency to accept, if not a very logical, idea that certain forms of very distinct punishment are lawful, and that certain forms are unlawful. Mutilation, for example, might prove a very deterrent penalty; but if a Bill directing that a prisoner sentenced to penal servitude should be blinded or have his tongue committing a murder, should have any small chance of becoming out out would stand but a vision of Mr. PEASE's Resolution law. Consequently the adoption of Mr. PEASE's Resolution would leave the community in the presence of a formidable danger. With the number of prisoners increased by the addition of those who are now hanged, and with the recklessness and desperation of the whole body increased in the same proportion, the only fear which now keeps a prisoner who knows that he will never be set free from murdering, or trying to murder, his gaoler, whenever a wayward fancy or ungovernable fit of rage happens to seize him, would be altogether withdrawn. The probable result would be to make the gaolers trust entirely to their weapons and to their dexterity in using them. Capital punishment would still be inflicted; but it would be inflicted in a species of chance medley. The gaolers would feel that they carried their lives in their hands, and they would take care not to lose them by over-punctiliousness. The least indication that a prisoner meant mischief would be accepted as a sufficient reason for shooting him down.

We have insisted on this particular aspect of the question because the *a priori* argument seems beyond the possibility either of proof or of refutation, and because it was scarcely referred to in the debate. Mr. PEASE thought it enough to say that, as a rule, those upon whom death sentences are passed are not dangerous prisoners, and do not come from a dangerous class. How long would it remain possible to say this after capital punishment had been abolished? At present there may be some plausibility in the statement, because the majority of murders are now committed at the bidding of some sudden impulse which does not leave time for the prospect of death to exert its naturally deterrent influence. But, if capital punishment were done away with, it is probable that a large number of assaults which at present are not pushed to the extreme length of causing death would slide insensibly into murder. It is no reverence for the lives of his victims that keeps the hero of a Lancashire kicking case from making the kick fatal. He would prefer committing murder if he could evade what follows upon murder, and if the special consequences which he dislikes were removed there is no reason to believe that he would any longer hesitate about indulging this preference. Not only, therefore, would the number of murders be increased by the addition of many which now take the milder form of savage assaults, but the character of the class undergoing punishment for murder would be altered for the worse. Nor is it necessary for the purpose of this argument that the prisoners from whom murderous attacks on the gaolers would be to be apprehended should have committed murder. There are many criminals who have stopped short of this length, but who are only induced to stop short of it, even while they are in prison, by the knowledge that this time, if never before, murder will mean certain death. If Mr. PEASE ever carries his motion, the post of warder in a convict prison will be like a forlorn hope. In this matter our sympathies are with the prison officials rather than with the prisoners over whom they keep guard.

RAILWAY BRAKES.

IT is satisfactory to observe that the Board of Trade, though it has postponed indefinitely any attempt at a general scheme of legislation with regard to the dangers of railway travelling, upon which a Royal Commission lately reported, is not disposed altogether to neglect the subject. It appears from a correspondence which has just been laid before Parliament that in July last a proposal was made by the Board to the Railway Companies Association that the latter should name two or more persons of high authority on such matters who would meet officers of the Board from time to time and discuss some doubtful or difficult point. The most efficient form of continuous brake-power was subsequently suggested as a subject which demanded attention; and, in reply to an application for a consultation on this question, Mr. LEMMON, the Chairman of the Railway Com-

panies Association, wrote a very polite letter expressing his own and his colleagues' "cordial appreciation of this considerable and practical suggestion"; and stating, in reply, that "the principal Railway Companies, representing four-fifths, or about 12,000 miles, of the whole passenger mileage, were testing in the common interest, and with the object of elucidating the action of continuous brakes under all conditions, various inventions of the kind, which were specified." It was added that, in the opinion of the Association, it was not essential to have one form of brake universally adopted; and that, though many of the systems tried afforded sufficient arresting power, trustworthy conclusions relative to the endurance of the machinery, the facility of application, and certainty of action, could only be formed after further trials and continuous use in daily practice.

No consultation appears to have taken place; but in April this year the Board appealed to the Association to be a little more explicit and specific as to what it was actually doing; and drew up a series of questions, which were sent round to the Railway Companies. The answers to these questions are given in the Parliamentary paper just issued, and may be summarized as follows. The Caledonian Railway replied that it had made experiments with the WESTINGHOUSE ordinary brake, the STEEL-McINNES brake, and CLARK and WEBB's chain-brake, and had found that they could be applied instantaneously, though the STEEL-McINNES was the only one which was self-acting; that these were in use on certain passenger trains, and that further experiments were to be made to test the automatic forms of the WESTINGHOUSE and CLARK and WEBB's systems. The Furness Company declared that "it was quite alive to the importance of having such brakes," but had "not yet adopted any kind of continuous brake." On the Glasgow and South-Western Railway the WESTINGHOUSE continuous automatic brake has been in use on the express trains to the South, and is considered to be efficient, though it is self-acting only until the compressed air is exhausted. The Great Eastern has also several systems in use, none of which is self-acting when accidents occur; but it is now fitting up an arrangement of SMITH's vacuum brake which will be automatic in case of "break away." The Great Northern works chiefly with SMITH's brake, which can be instantaneously applied, and made self-acting in cases of accident; and on this line experiments are still being made. The Great Western has also made trial of several plans, especially SAUNDERS's brake, which it thinks the best; but it cannot fix a time to fully report upon the results. FAY's and NEWALL's system is adopted on the Great Western, but it is applied by hand, and is not self-acting; the Company, however, is getting WESTINGHOUSE's automatic brake for one complete train. The Brighton Company has no continuous brakes at present; but believes that the engine brakes invented by its Locomotive Superintendent work well. The London and North-Western Company considers the CLARK and WEBB brake very satisfactory; but it does not appear that it is self-acting, and, except under peculiar circumstances, the ordinary brake is used. The London and South-Western Railway has, as from its notorious mismanagement might be expected, "made no experiments with continuous brakes," but is thinking of doing so. The Manchester, Sheffield, and Lincolnshire Company rests satisfied with the vacuum brake, regarding continuous brakes as dangerous. The vacuum brakes on the Metropolitan Railway are said to work all right, but are not self-acting. The Midland uses the WESTINGHOUSE, SMITH's, and BARKER's brakes; but only the first is self-acting. The North British Company has adopted the WESTINGHOUSE automatic brake, and, being satisfied, contemplates no further experiments; and the North-Eastern is also going to try the same brake. On the North London line the brakes can be applied instantaneously, but are not self-acting; and this Company has no further experiments in view. The North Staffordshire Railway works with CLARK's brake, which is said to be "efficient and safe if carefully applied," though there have been "complaints and claims for personal injury where it has been too quickly taken off." Still the Company holds that "it answers every purpose." The South-Eastern is satisfied with the vacuum brake.

These replies are, of course, in a way plausible enough; but the inquiries set by the Board of Trade unfortunately omitted one very important point—within what space the brakes actually in use can stop a train; and without this

the replies are comparatively valueless. It will be remembered that the experiments made, at the request of the Board of Trade, by the Railway Companies at Newark showed that the amount of hand brake-power usually supplied with the trains of the respective Companies, moving at from 45.5 to 48.5 miles per hour, failed to bring up the London and North-Western trains within 2,374 ft.; the Caledonian within 3,190 ft.; the Midland within 3,250 ft.; the Great Northern within 3,576 ft.; the Brighton within 3,690 ft.; and that, as these trains were in complete order, and previous notice was given of the exact spot at which the stoppage was to be made, a large addition must be made to these distances in practice. It was therefore held that, unless much greater control was obtained over trains by additional brake-power, it was clear that, in order to ensure safety, the distance signals must under such circumstances be, for a level line, carried back a mile; and the Commissioners laid down the principle that no train can be considered properly equipped which is not furnished with sufficient brake-power to bring it, at the highest speed it would be running at upon any gradients in its journey, to an absolute stop within five hundred yards, and expressed a belief that means might be found by which this could be done with certainty and safety.

Now the question is, whether this condition is really complied with on any line at this time, or whether the new appliances which certain Companies say they intend to adopt will fulfil it. It may be admitted that, as far as experiments have gone, some of these appliances are satisfactory; but an experiment is in all cases, and above all on a railway, very different from actual working, in which things are done with much less care and more confusion and muddle. Moreover, even when the automatic brakes are adopted, it seems as if they are intended only for special emergencies, and that the present inefficient hand-brakes are to be the usual resource. This indeed is candidly admitted by the London and North-Western Company, whose guards are given to understand that "for ordinary stoppages at roadsides or terminal stations the van brake"—a hand brake—"alone is to be used," except under special circumstances, and that "the patent brakes are not to be used for such ordinary purposes, or for stopping a train entering a terminal station." Moreover, there are not a few lines which have no automatic brake-action at all, or only in a partial form—that is, when it is expressly put on. It is no-doubt true that automatic appliances ought not to be solely relied upon; but they are important in their way. According to the report of experts on the Newark trials, "not only should a driver and guards be able, independently or acting in concert, to promptly put in action all the brakes of a train, but also, in case of the severance of a train, they should have complete control over the brakes of the several portions to which they might respectively belong, to apply or release them according to their judgment, so that they could modify the automatic action instantaneously if required." But it is very doubtful how far this ideal will be attained in ordinary journeys, which are those in which passengers are most interested. Another circumstance which prevents us from being very sanguine as to the resolution of the Companies to do all they can in this matter is that, although their present arrangements are practically under the standard of the stopping power which ought to be enforced, most of them intimate plainly enough that they "do not contemplate any further experiments." Under these circumstances it is to be hoped that the Board of Trade will not be satisfied with the vague and possibly misleading statements made by the Companies, but will take the opinion of some independent authority as to the facts of the case.

THE GOVERNMENT IN A FIX.

THE scene which took place in the House of Commons on Thursday night shows very plainly the distracting dilemma in which the Government have placed themselves by the illogical and fluctuating course which they have pursued with regard to the Bill for closing public-houses in Ireland on Sunday. This is a subject which has been under discussion for some years, and the question at issue is in itself a very simple one, though the necessity of finding a solution is in one way or another makes a serious

difficulty for the Government. There is apparently a large body of the population of Ireland which, for reasons of its own, is anxious to get all public-houses closed on Sundays; on the other hand, there is another section which is very strongly opposed to this proposal, and which argues that, so far from such a measure tending to promote temperance and sobriety, it would have the very opposite effect by driving the people into the shambles which would be established if the regular houses were closed. It is quite certain that there is already in Ireland a great deal of drinking on Sunday, and it is difficult to believe that the appetite for this indulgence, which would seem to be deeply rooted, will immediately be overcome by closing all the public-houses on one day of the week.

In order to understand the position of the Government with regard to this question, it is necessary to go back a little and observe the various stages through which they have passed. At first they were disposed to offer a decided opposition to the measure; but the agitation which was going on in Ireland began to have its effect, and, though having a clear conception of the difficulties which Mr. SMYTH's Bill would involve, they adopted a temporizing tone. Accordingly, when the second reading of the Bill was moved on the 12th of February last, the IRISH SECRETARY gave it a qualified approval; and, in spite of strong remonstrances from a certain number of Irish members, it was carried by an overwhelming majority. On this occasion Sir M. HICKS-BEACH repeated what he had stated in the previous year, that, in his view, based upon the evidence of magistrates and police authorities, it was not advisable that total Sunday closing should be adopted in the larger towns, there being reason to fear that either there would be a widespread evasion of the law, or if the law were thoroughly enforced, a danger of riotous proceedings. Here were, indeed, obvious reasons why the Government should be cautious how they committed themselves to a movement from which such results were expected; but at the time their chief object was to diminish the pressure of Irish opinion. A compromise was therefore resolved upon, which was that, after the Bill had been read a second time, it should be sent to a Select Committee, in order to be thoroughly considered and sifted, and adapted to the different circumstances of town and country, but without entering into the whole question of *indio*. This Committee has since reported in favour of disregarding the distinctions between large and small towns, placing all alike under the operation of the measure; and the Bill, thus backed up, has now come on again. On Thursday Mr. SMYTH appealed to the Government to state their intentions with regard to it. To this Sir STAFFORD NORTHCOTE replied that, as the Bill would necessarily lead to considerable discussion, it was difficult to see how a day could be obtained for it; and he begged to be excused from making a definite statement as to the intentions of the Government. Upon this Mr. SMYTH rose at once, and, asserting that it was distinctly understood that the appointment of the Committee took the question out of the hands both of the House and the Government, and left the question to be settled by its report, whatever it might be, announced that on Monday he should repeat his question, and moved the adjournment of the House. Other members expressed the same view, and finally it was arranged that Sir WILFRID LAWSON should give up the Wednesday which he had obtained for the Permissive Bill in order that the Irish Bill might be taken. And so the matter at present stands.

This condition of things is, of course, very embarrassing for the Government; but it is also obvious that they are themselves responsible for what has happened. They have been playing with the question without distinctly making up their minds what they should do about it, and they must take the consequences. They had good reason for their doubts in the first instance as to the expediency of such a measure as the Sunday Closing Bill, which in principle would affect not only Ireland, but the whole kingdom, and nothing has occurred to remove those doubts. Sir M. HICKS-BEACH, in February, declared that they could only sanction the Bill if they felt that the experiment could be made with safety, and the conditions of safety on which they insisted are now refused; so that the Government do not know which way to turn.

THE FELLAH.

A LITTLE girl asked her father who was starting for Egypt, if he should see Joseph at Cairo. The question was not so absurd as it may have seemed. Nothing astonishes the modern tourist more than to find the scenes described by Moses, and represented by the paintings in ancient tombs, still faithful pictures of the manners and customs of to-day. But Joseph, the "discreet and wise" ruler, is nowhere to be discovered. There are prisons and executioners, coats of many colours, and Mrs. Potiphara in abundance. There are lean kine and fat sheaves, corn as the sand of the sea, honey, spices, myrrh, nuts, and almonds. There are cruel taskmasters and forced public works. The first-born is mourned in many a house, for the conscription has taken him and he returns no more. On all sides may be heard a great and bitter cry, not on account of bad harvests or unseasonable weather, not because of earthquakes or the low price of wool, but for unjust, grinding taxation, and hard, ill-paid toil. "We work all day," said a Fellah lately, "for a morsel of bread, and the Khedive takes it out of our mouths." It is extremely difficult to obtain correct information with regard to the real position of the peasant farmers in Egypt. It is impossible to believe even the oath of a native; but, by sifting contradictory statements, by contrasting the replies given by different dragomans to the same question, by riding along the inland roads, seeing the daily life and occupations of the people in their villages, shopping in the bazars, and becoming acquainted with the small artisans, but above all by talking with the sailors who come from the various little towns round about, an intelligent person may, with a very moderate smattering of Arabic, obtain a fairly true notion of the state of that interesting and misgoverned country.

The announcement made lately that additional exactions are to be laid on the already overburdened people cannot fail to raise a feeling of indignation in the mind of any one who has become acquainted with the Fellah at home. We talk much in England about slavery in Egypt, and are greatly shocked that such a thing should exist anywhere. Benevolent people ask questions about it in Parliament, and old ladies become hysterical on the subject. The fact is that the position of a slave in an ordinary household is luxurious idleness and well-fed comfort compared to that of the peasant proprietor or agricultural labourer. There are strict and humane laws made for the slave. He can have justice for every wrong except that which made him a slave. But the Fellah is practically helpless. No one can interfere because the taxes are increased in the Said, or because the land is in some places relapsing into desert, since the people can no longer buy seed, having nothing left after the collector's visit but their naked, hungry children and the bare mud. The money raised by taxation goes to enrich the collector, the governor, the pasha, the Khedive, everybody except the native Egyptian and Egypt. New streets and palaces, gardens and harems, harbours and lighthouses, are being made; but nothing comes back to the earners of the money which pays for these costly undertakings. Great sugar factories are built in which the machinery is constantly changed as English or French overseers are appointed. The old works are left to rust on the banks, though their price has been wrung from the life-blood of the people. When things were supposed to be at their worst last year, the Viceroy gave a sumptuous breakfast and presented each guest with a costly ring. His sons are growing up and require establishments. English horses, diamonds, eunuchs, and pretty Circassians are expensive necessities which must be provided. Daughters require dowries suitable to their exalted rank. Still more expensive are standing armies and fruitless expeditions to Abyssinia and Turkey. Immense sums go to entertain foreign visitors of distinction and to provide steamers and trains for them. English people are apt to forget that the Khedive, with all his virtues, is still a Turk. He impresses strangers who have the privilege of an interview with him by his ability, industry, intelligence, and good impulses. But he has had no early practical training, and has all his experience to acquire through making mistakes. Were he William Pitt himself, he could not succeed in filling the positions simultaneously of Chancellor of the Exchequer, Foreign Minister, Minister of War, Board of Works, and general autocrat.

The land, as its peasant cultivators say, is gold, not mud. For ordinary crops it requires no manure and little labour. The yield, with the most primitive tillage, is enormous. Two crops of corn may be grown in a year, or even three. The moment a canal is made, the ground in its vicinity grows green. It needs no preparation for the seed but a little surface scratching and small watercourses for irrigation. Along the Nile the shaduf goes all day long, except during the inundation, when it is not required. In some places the sakia, with its rows of graceful earthen jars, raises water both day and night. At the wheel two yoke of patient oxen relieve each other, driven by a child who ought to be at school. The Khedive spent a great deal of money in putting up large pumping engines; but they have turned out useless, partly because of the non-existence of fuel, partly because the smaller parts wear out, and cannot be replaced by native workmen. There is some talk of cutting a canal and floating wood down from the upper Nile. M. Lesseps has lately been over the ground, but bondholders must surely by this time be becoming somewhat chary of their help. Meanwhile the old labour-wasting methods must be retained. New canals might be multiplied indefinitely, always with splendid results, but, under the present system of

forced labour, they can only be cut at the cost of the lives of many bread-winners. The Fellah, drafted away from his home, hard worked, ill-fed, harshly treated, dies of the slightest illness. It is said that, when a new canal is begun, the Khedive seizes the land nearest to it, his officers take what comes next, and the Fellah who makes it gets little or no benefit. He is obliged still to stand at his bucket, and, with only a rag round his loins, work the water up to his little tenement, while the intense sun blazes down on his bare back and shaven head. It is unlikely that any private enterprise can spring up amongst the people to improve the cultivation of their farms. They are too poor, and have not time to learn about new inventions. The fine climate prevents them from being braced to exertion and rebellion, as would be the case in a more northerly country. But they do feel very sore to see the land slipping into the hands of large proprietors who take all the finest ground for sugar-canes. When the present Viceroy succeeded, he had no estates. Now he owns a very large acreage. This change in his circumstances was not brought about by means which would be approved here. A case in point is that of a sugar estate not far from Farshoot, but on the east bank. The land was bought at the Government valuation from the present proprietors, who were never paid, it being arranged that the price should be taken out in exemption from labour at the factory and in sugar. After a time it turned out that the land did not suit sugar, and the factory was abandoned. It stands empty and useless, though it cost many thousands of pounds and much forced labour. But what became of the land? It was sold back to the original proprietors again at the Government valuation, which had been revised—that is to say, raised—but ready money was exacted for every acre. It need hardly be added that the whole district is reduced to absolute beggary, that the Government is not exactly popular, and that a man whose camel was "requisitioned" to carry cane killed it rather than let it go.

At sugar factories forced labour is the rule under a thin disguise. The labourers are paid in sugar, which is valued at the Cairo price. If a man wishes it he can sell his sugar to the authorities at the factory, but it is at the local price. As the sugar is useless to him, he is thus robbed of a third or a fifth of his earnings. The land itself is made the means of similar extortions. It is revalued for taxation every six years, and if it is situated by the river, where the banks are altered by every inundation, the unfortunate farmer has often to pay for several years after his land has disappeared. Land left dry becomes the property of the village or "commune," and last year a sheikh was murdered by his own villagers for appropriating some common land to his own use. For this the village was burnt by the Khedive, who seized the land of the whole commune himself; and nothing can more plainly show the state of political degradation to which Turkish rule has reduced the country than that the punishment was looked upon as just, and acquiesced in without a murmur. The people do not care to grow sugar for the Khedive's benefit, but much prefer corn crops, of which both barley and wheat are everywhere common. The Fellah rarely eats his own wheat. It is a luxury far beyond him; but sailors in the Nile boats live on the brown bread made from it. The corn is left standing till it is perfectly hard, as there is no rain or wind to hurt it. It is in ear in February, and is reaped with the sickle; but in Nubia it is pulled up by the roots; and the farmer often, if he has a good crop, goes with it himself by boat to Cairo. It is classed according to the colour, which varies very much, and the straw is chopped fine as food for camels or fuel for steam-engines. The ordinary bread-stuff is "doura," which is much like Indian corn. This is sown before or during the inundation, "cast upon the waters," and is sometimes swept away. It is often roasted before it is ripe, but generally made into unleavened cakes. It is also given to fowls by those who can afford to feed their chickens; but generally the poor beasts pick up a precarious living amongst the dust-heaps, so that their eggs never taste fresh or milky, and their bodies are nothing but bones. The great staple in Egypt, however, is the date. Palms are heavily taxed by the suicidal policy everywhere seen under Turkish rule; and the Arabs say, alluding to this tax, that where the Turk comes no trees can grow. So highly is it esteemed that, according to the native legend, when Allah had made man and woman, he had a little clay left, and of this made a date-palm.

Constant ill-usage has made the Fellah a coward and a liar, but he has courage and endurance when suffering is inevitable. You may see a man at work in heavy irons, yet he wears a cheerful countenance, and greets an old acquaintance with a pleasant laugh. He has committed no crime, and everybody knows it; but a crime had been committed, and somebody had to be punished. "Khatmet" willed that he should be charged, and, having no money to bribe the judge, he is condemned. So, too, rather than pay an increased tax, he will submit to the bastinado, and may be heard to boast of the number of blows he can bear and the weeks during which he was unable to put his feet to the ground. He looks upon the Government as his natural enemy, and with good cause regards taxation as a border farmer must have regarded blackmail. To him the Khedive is the lineal successor of the Bedouin robber who robbed his forefathers. He has no remedy against an overcharge, and no voice in the assessment of the tax. If there were a printed form setting forth his liabilities it would be useless, for he could not read it. By nature he is gay, sober, and saving; yet he can be lavish on occasions, and does not grudge money spent in hospitality or charity. His own wants are few,

but among them is music. Nothing can be done without singing. He sings at work, at play, in the field, at the wedding; at the funeral, as he rows his boat, as he rides his camel, in fact everywhere. Sometimes, as when he works the shadoof, there is great beauty in the oft-repeated cadence; but generally the European ear can find no melody in his music. The scale differs so much from ours that it cannot be played on any of our keyed instruments; and the principles on which it is founded are so involved that it is hardly possible even for a trained musician to unravel it. There is probably a mixture of the Greek and Asiatic scales; possibly there is a remnant of old Egyptian harmony. The scientific musician finds much to interest him in following a song on the violin, but to the vulgar musical ear it is distracting. It may be roundly asserted that the attempts made by Lane and others to write Arab melodies in our notation are ludicrous failures. The native performers sometimes show great skill in manipulating an instrument with two strings, and some Egyptian Paganini may blush unheard and waste his sweetness among dusky sailors on the Nile. At Cairo a leaning towards the European scale is sometimes very perceptible, owing to the opera companies which go there every year, and the military bands practise a kind of compromise which is most distressing to hear; but a concert of expert native performers in the Ezbekiyah Gardens is well worth hearing. In the country singers extemporize to a tune, but have special airs appropriate to all possible occasions. No other art is practised, and life goes on under the most simple conditions.

The Fellah wears but one garment, and suffers from cold in winter, for he has no fire and no bedclothes, except perhaps a kind of quilt. He lives on unleavened bread, sour milk, raw vegetables, but sometimes for weeks together has nothing but dried dates. In towns the food is sold ready cooked, and consists of different kinds of haricots and lentils. His house is roofless, except for a few canes laid across the low mud walls. It contains no furniture; but in Upper Egypt there is generally a mat at the door and a sort of raised divan made of mud. He can afford but one wife, who, like himself, has but one garment and a hood or veil, while his children go naked. In this respect, indeed, travellers remark greater poverty year by year. There is immense mortality among the children, partly, no doubt, from the dirt in which they are kept, as they are never washed before they are seven years old, but partly also from the absence of medical aid and the universal ignorance of the causes of disease. The women are in every respect inferior to the men. They are too poor to have employment; they have no stockings to darn, no house linen to mend, no furniture or cooking implements to clean. They wash their one garment in the river, cleaning it with a piece of mud which acts like soap and pumice combined. They wear their bracelets and necklaces in the field where they pull corn or herd the cattle. They carry all the water required in their houses from the river in heavy jars, and sit long on the bank gossiping and catching fleas. Women in Egypt do not say prayers like the men, and have a soulless expression which contrasts strangely with the intelligent and even noble look frequent among their husbands. Their highest idea of life consists in doing nothing. The daughters of a family are kept at home as long as possible, as it is a mark of respectability to retain them at least till they reach fifteen; but this advanced age is only attained in comparatively wealthy homes. In Nubia the position of women is better. Though the clothing is even scantier than in Egypt, they have some idea of working embroidery, weaving mats, and making baskets; and they keep their houses in better order, spreading the golden sand on the floor and sweeping it clean. There are doors to all the houses, and sometimes an iron lock and even a knocker. Over the doorway there is an attempt at ornament, and a plate or saucer begged from a passing dahabeenah is sometimes inserted. Before the door is a row of round mud bins like barrels for storing corn; and there are separate pigeon-houses. The pigeons everywhere eat more than they are worth, and contribute greatly to the dirt of the houses in Lower Egypt. Fever is rare, considering the filth, but there are stomach complaints and innumerable skin diseases of great severity. Ophthalmia is said to be decreasing in Cairo since the opening of wider and better-watered streets, but everywhere else it is very common, and seems to be carried by the flies from child to child. There is also a mysterious sleeping sickness, about which doctors differ; it is always fatal. A man comes home from his work, lies down, and sleeps for three days, when he dies. It is impossible to get leave to make a post-mortem examination, though English physicians have repeatedly attempted it.

It is hard to imagine a more dreary existence than that led by the ordinary Fellah. He is born, works hard all his life for wages of which he is robbed at intervals under the name of government, and dies in his birthplace, his whole view through life having been bounded by the table-topped mountain at his own side, of the river and the table-topped mountain at the other, under whose rocky sides a few little mud domes, a few little heaps of skinned gibbons, mark the nameless graves of his people, the place to which, when the end comes, his body will be rowed across the Nile to a chest from the Koran, just as five thousand years ago his ancestors were ferried over to the mummy pits, while a hymn was sung to Osiris, the Judge of the Dead.

SERENDIPITY.

AN ungrateful world has probably almost forgotten Horace Walpole's attempt to enrich the English language with the term "Serendipity." To speak of a man as "gifted with unusual serendipity" is as much as to speak in an unknown tongue. The philological mind would go to work on the expression, and probably resolve it into "a carpet-bag word" of the sort introduced to science by the author of *Alice in Wonderland*. Yet the term has nothing to do with that combined serenity and pity with which most people are capable of observing the misfortunes of their friends. It expresses a more original condition of mind, and being, as it is, a name for what is otherwise nameless, deserves a better fortune than oblivion. It is never easy to say which new vocables will, and which will not, survive, and the extinction of "serendipity" merely shows that, like the Dodo and the Moa, it has somehow failed to adapt itself to its environment. To find out the reasons of this want of success is not very difficult; but in the meantime it may be as well no longer to keep back from the unconstructed meaning of serendipity, and the nature of the quality on his share in which Walpole plumed himself.

It may be asserted in favour of Walpole's coinage that it expresses a certain form of luck which otherwise must go nameless. A person fortunate enough to be endowed by nature with serendipity is a person who has the gift of putting his hand, at once on the very thing that he happens to want. It does not matter how suddenly the wish has risen in his mind—he finds what he needs or covets the moment he looks for it, or even when he has not yet begun to take the trouble to look. In a way he resembles the hero of Balzac's *Peau de Chagrin*, but with a happy difference. The owner of the *Peau de Chagrin* had every desire satisfied, but with each satisfaction the malign charm sank into smaller space, and the life of its possessor dwindled. There is no such drawback in the case of serendipity. The expression was derived by Walpole from a certain Prince of Serendip in a fairy tale, a kind of Fortunatus, who had the luck to find in an instant everything he was in search of. Probably the obscure derivation of the term was among the causes which prevented it from enjoying the blessed survival of the fittest.

It is clear enough that serendipity is a very different thing from mere ordinary luck. We call a man lucky, for example, who escapes unhurt in a railway accident, or in the explosion of his domestic boiler, or when a run-up house in a new quarter falls upon him; in short, a man is lucky who evades any of the numerous perils with which mechanical science has enriched daily life. This use of the word "luck" is of course slightly illogical, for the man is really more lucky who happens not to be involved in any accident at all. But this sort of good fortune is quite distinct from serendipity. Take another kind of luck. We call the man lucky who is always meeting with chance gifts of fortune. The old lady whom he rescues from a yelping poodle leaves him an estate; he cannot enter his name in a club lottery without winning the sweepstakes; all ordinary things go well with him, and extraordinary hazards fall out, as it is by special arrangement or pre-established harmony, for his comfort and well-being. But serendipity is entirely distinct from this favouritism of fortune. The mere lucky man gets things without looking for them or thinking of them; the man with serendipity has to be grateful for much smaller favours, but then they are the favours which he happens particularly to want. The fairy or fate who presided at his birth made him the magical present of the power to evade small and tedious exertions. Take the instance which Walpole seems to have had especially in his mind. Two men may be in doubt about a reference in a book—a reference which it is necessary for their work or for their mental satisfaction that they should find. Give one of them indexes without number, as indexes have always been in this imperfect world, and he will labour in vain, and search for hours with no result but loss of time and temper. The other, the man with serendipity, has only to take up the first volume that lies near his hand, or even by chance to look at a newspaper, and what he wants or a clue to what he wants leaps to his eyes. His literary luck brings him the very passages that he would have most earnestly desired to seek out as soon as the idea that he needs them flashes through his mind. He may be in all other matters as hapless a mortal as any that breathes. His life may be a mere embroglio of cross purposes, a tragedy of errors; all his investments may prove rotten; he may break every bone in his body in a series of accidents; but this one good thing of fortune he possesses.

Serendipity is not confined, of course, to a happy knack of hitting on the right page of a book at the right time; though even this is no small boon, as people who lack it will confess. In all the minor matters of life the gift has its power, and the owner of the gift falls in with just what he has begun to wish for, and would soon have begun to look for. If he has set his heart on any out-of-the-way possession—a rare old book, a particular piece of antiquated furniture, a park back of unusual acquisitions; a house in the country within easy reach of town—the desirable thing falls, as it were, into his lap. The first bookstall he passes has the rare volume; a broker in a back-street where he has lost his way happens to display the carved chest; the man who dines at the next table to him at the Club is parting with the horse, or wants to let the house. The inheritors of the luck of the Prince of Serendip save a small fortune in advertisements, and a world of trouble in running up and down in search of what they need. The luck, the gift takes the shape of securing at the first venture

servants and governesses who are "treasures," and who get married just in time to prevent them from becoming old family retainers of the tedious and trying kind.

Luck, in the large sense of the word, is so marked an influence in human affairs that people have tried to account for it and for its opposite by certain characteristics in the persons who have it or have it not. The want of luck may no doubt cause a certain shade of melancholy in the expression of the face; but early theorists turned the matter the other way, and thought that they could detect in the countenance, not the trace of bad fortune in the past, but the presage of it in the future. Indeed it is not easy to guess why Charles I. should have looked unlucky before his misfortunes began. In the Icelandic Sagas every one seems to have read bad luck in the faces of certain men—Skarphedin, for example, whose splendid strength, courage, and backing of friends gave every promise of prosperity, but who yet failed to make strangers take his side and share his fortunes. But superstition taught, or experience showed, that good fortune would not go with a peculiar, indefinable yet perceptible cast of face and character. In the same way it is often noticeable that lucky people have a brilliant, a sort of magnetic, fulness and force of life which seem to attract and command the inscrutable influences that make for success in matters of the merest chance. This theory of personal influences of a mystic sort has been used by otherwise sensible people to explain a fact which is a sort of serendipity unattached; the fact, namely, that the thought and the mention of some persons seems to force itself on the mind and into conversation immediately before the appearance of these persons on the scene. We may fancy that they are hundreds of miles away, yet the notion of them presents itself to the fancy or memory, and lo, the actual man is before us. This faculty, in its highest power, is naturally ascribed to a being with such a potent personality as our ghostly foe, who notoriously appears whenever he is spoken of.

These fantastic theories of luck may be dispensed with in the attempt to explain serendipity. There is a common-sense way of looking at this gift, which leaves a very minute residuum for magnetic and mystic expounders to clear away. The fact is, a person who is proud of his serendipity is often one whose desires are set on matters close at hand (though to his innocence they seem rare or difficult of attainment), and who is easily pleased, and triumphant over small successes. Serendipity means contentment, heightened by that complacency with which we all regard a thing so peculiarly personal to us, so much our very own and unshared by others, as our luck. It would be a pity if philosophy ever drove out of the world this idea of luck, on which so many good little books for the young wage war. The idea of a fortune which is attached mysteriously and invisibly to each of us is among the greatest consolations to humanity. Whether the luck be good or bad, whether it affects the shape of small or great failures and successes, it is equally food for self-complacency. We are so much the more important in our own eyes because we are the favourites or the victims of a vague spiritual force, and have a little share of the attentions of an unknown cosmic influence. The contented man does not ascribe his placid habit of hitting on what suits him to his temperament, but to his chance, to his serendipity. The discontented finds an unfailing consolation in saying "Just my luck," and in having something outside, something fatal, to blame in place of his own shiftlessness. Of course it is obvious that the notion of luck obscures every one's knowledge of himself; and in the case of the discontented this is perhaps a pity. Their friends soon learn to dread the reproaches which they heap on their usual luck, for with each reproach the victim of misfortune becomes less aware than before of what manner of man he is. But it does no harm to any one that the happy mortal gifted with serendipity should increase his self-complacency by valuing his immaterial treasure. He is a person with many little tastes which are easily gratified by many common little chances, and if he likes to conceal these humble characteristics from himself, and to raise in his heart a small altar to Good Fortune, no one is the worse for the delusion. The case of literary serendipity is less innocent, for the man who always hits at once on the reference or quotation that satisfies him is probably far from being too conscientious a student.

THE WICLIFFE CENTENARY.

IT appears that last Sunday was the five hundredth anniversary of John Wycliffe's condemnation by the Pope. And of course so excellent an opportunity of getting up a Protestant demonstration could not be let slip either by divines of Dean Stanley's peculiar type—who preached on the subject at the Abbey—or by the Evangelical and Dissenting notabilities who assembled on Monday evening at Exeter Hall to commemorate the auspicious occasion. One familiar name indeed is conspicuous by its absence. The report states that the Earl of Shaftesbury, K.G., was to have presided, but that a letter was received from his lordship at the last moment expressing his deep sympathy with the demonstration, but regretting that the state of his health prevented his attendance. There appears, however, to have been a little mistake here. Lord Shaftesbury wrote to the *Times* the next day to say, with some excusable asperity, that he had addressed two letters on the subject, to Dr. Cather and Dr. Angus, in neither of which had he said anything of the kind; on the contrary, he had absolutely refused either to preside or to attend the meeting. We venture to think he showed a sounder discretion than some

of the gentlemen who appeared on the platform, but of that our readers will be able to judge better for themselves presently. In the absence of Lord Shaftesbury the chair was occupied by Lord Plunket, Bishop of Meath, whose opening address was, both in a religious and intellectual sense, very much what might have been expected from a prelate belonging to the extreme Evangelical section of the disestablished Irish Church. He said a good deal more about Protestantism in general and Irish Protestantism in particular than about Wycliffe, and what he did say about the hero of the day was remarkable rather for alliterative rhetoric than for historical accuracy. To call Wycliffe "a Reformer before the Reformers, a Protestant before the Protestants, an Old Catholic before the Old Catholics, a translator before those to whom that title was usually given (did Lord Plunket never hear of St. Jerome's translating the Bible?), a writer and collector of tracts before the Tract Society had a local habitation and a name," was of course a safe bid for the rapturous plaudits of Exeter Hall. Much the same thing has been repeated to weariness of Huss, Tauler, Savonarola, and other mediæval worthies, with about equal infelicity; it only means, so far as it means anything at all, that they somehow or other, though in very various ways, came to grief with the ecclesiastical authorities of the day. We really hardly know in what more dignified language to express it. As to "the Reformers" and "the Old Catholics"—the latter especially—we are by no means clear that they would altogether appreciate the compliment thus thrust upon them. Some of Wycliffe's most pronounced opinions would be quite as little palatable to Prince Bismarck as to the Pope. A "Protestant" in one sense he certainly was, for he spent his life in protesting against everybody and everything about him; the question is whether he did not "protest too much" by a good deal. Lord Plunket, it is fair to say, went on to give a more specific description of his hero, but unfortunately as he advanced in definiteness he betrayed a more definite misapprehension of the facts. "Wycliffe," he observed, "was a man of great intellectual power, of statesmanlike wisdom, of great and varied learning, of dauntless courage, of true piety, and above all a self-sacrificing, earnest follower of the Great Master." To the last part of the panegyric we have nothing to object, except that it is not easy at this distance of time to discriminate with any confidence between the very opposite estimates of Wycliffe's character which have come down to us. But praise of his "statesmanlike wisdom" and "dauntless courage" would sound from the lips of a less partial and better informed panegyrist very like a studied sarcasm.

Dr. Cather, who followed the Bishop and is described as "General Secretary of the Christian League and Systematic Benevolence Society," made a statement explanatory of that high-sounding designation, which the reporter calls "lengthy" and has considerably spared his readers. He added however that he had heard Mr. John Bright express an opinion "that Wycliffe was the greatest man England ever produced." Mr. John Bright has expressed many opinions in the course of his life which we should hesitate to endorse, but we have sufficient respect for his judgment to be willing to hope that Dr. Cather's memory was here again at fault, as in the case of Lord Shaftesbury's letter. He wound up by observing, what is perfectly true but does not quite chime in with the Bishop's eulogy on his "dauntless courage," that Wycliffe "outlived the storm, and died peaceably at Lutterworth." Then followed the great oration of the evening by Dr. Farrar, who moved a resolution long enough to be a speech in itself, attributing to Wycliffe almost everything, sacred or secular, for which Englishmen have reason to be thankful, though he contributed in fact very little to any of the seven "results" so elaborately drawn out and to most of them nothing at all:—

That this meeting desires most devoutly to record on this the 500th anniversary of John Wycliffe's condemnation by the Pope in five Bulls, addressed to the King, Parliament, University, Primate, and the Bishop of London, on the 11th of June, 1377, its exalting thanksgiving to Almighty God for the heroic, sublime, and unparalleled labours of this one foremost scholar, patriot, divine, statesman, and philanthropist, which he continued for thirty years, almost single-handed against all odds till his peaceful death at his rectory in Lutterworth, in 1384, have resulted, under the Divine blessing, in (1) the establishment of our national independence; (2) the restoration of our Primitive Faith; (3) the translation of our English Bible; (4) the formation of our liberties; (5) the formation of our language; (6) the creation of our literature and science; (7) and the consequent and ever-increasing greatness of the British Empire and of the English people, and calls upon the nation to glorify God in His honoured servant.

Dr. Farrar, however, prudently confined himself to "three immense services" for which "the Christian Church" (which must here be interpreted to mean the Protestant portion of it exclusively) "owed Wycliffe a deep debt of gratitude"—his repudiation of Transubstantiation, of "sacerdotalism," and of auricular confession. The selection of topics had at least the merit of being admirably adapted to the atmosphere of Exeter Hall. But Dr. Farrar, who is an impressive, if somewhat emotional preacher, can talk much better sense, when he pleases, than the slipshod and—we must be pardoned for adding—somewhat offensive claptrap which formed the staple of the speech he condescended to deliver last Monday. As to Transubstantiation, it is exceedingly difficult to ascertain what Wycliffe taught on that or any other controversial point of doctrine, inasmuch as, not being "actuated by the spirit of martyrdom"—as Hume mildly expresses it—in all his trials for heresy "he so explained away his doctrine by tortured meanings as to render it quite innocuous and inoffensive," and his disciples for the most part "imitated his cautious disposition," Huss

indeed, who may be considered his most illustrious disciple at a later period, was much more outspoken, and paid the penalty of his courage with his life, but there is no reason to believe that Huss ever rejected the received doctrine of the Eucharist. Dr. Lingard inclines to the view, which is also that of Sir J. Mackintosh, that Wicliffe maintained something very like the theory of consubstantiation or "impanation" afterwards adopted by the early Lutherans. If so, it is hard to see what particular debt of gratitude anybody owes him for formulating a dogma which is equally abhorrent both to Catholic and Protestant belief, and is, to say the least, not at all more Scriptural, while it is less easy to comprehend than that which it is intended to replace. "Sacerdotalism" is a word of wide and rather ambiguous significance; the reasoning by which Wicliffe assailed it would be quite as fatal to Dr. Farrar's position as Canon of Westminster as to that of Pope Eugenius or the Queen of Spain's confessor, to whom he refers. It is by no means clear that Wicliffe repudiated auricular confession as such—Huss certainly did not; and it is scarcely conceivable that he can have repudiated it, as Dr. Farrar alleges, "on the (wholly irrelevant) ground of his great doctrine that the Gospel itself was a sufficient guide to every Christian soul," for the professed object of confession is not "guidance" but absolution.

We must protest still more strongly, in the interests of historical fidelity, which controversialists of all schools are terribly prone to ignore, against Dr. Farrar's daring parallel between what he calls Wicliffe's "appeal to the laity" and the similar appeal of St. Athanasius to the people against "an Arianizing Court and Clergy," or even of Luther, when he "threw himself on the people and beat a bigoted Emperor and an infidel Pope." Luther was a man, whatever may have been his faults of conduct or opinion, who never lacked the courage of his convictions; when he said he would go to Wittenberg if it rained Duke Georges all the way, he meant it. Anything more unlike the character and career of Wicliffe can hardly be conceived. Dr. Newman has reminded us of St. Hilary's saying about the Arian period, "*Sanctiores sunt aures plebis quam corda sacerdotum*," but he explains that "sacerdotalism" means principally the bishops, or governing body of the Church, and that, as a rule, the clergy and the faithful held together in their adherence to the orthodox creed. But it was against the great body of the clergy that Wicliffe's fiercest anathemas were hurled. What can alone be meant by his "appealing to the laity," and how far it bears any analogy to the proceedings of Athanasius or of Luther, will appear from a very brief review of his eccentric career—which would not, we fear, have won, like Dr. Farrar's, "great applause" at Exeter Hall. It can only boast the humbler recommendation of being based on fact. The stern reformer of the luxury of the priesthood began his career by a violent attack on the friars, whose zeal and popularity had aroused the jealousy of the secular clergy, on the ground that a life of mendicancy was opposed to the precepts of the Gospel, and he charged them with no less than fifty heresies. His own life was austere, and there is no need to question his sincerity, but the justice of Hume's remark is indisputable, that "this is a circumstance common to almost all who dogmatize in any new way; both because men who draw to themselves the attention of the public, and expose themselves to the odium of great multitudes, are obliged to be very guarded in their conduct, and because few, who have a strong propensity to pleasure or business, will enter upon so difficult and laborious an undertaking." In his newborn zeal against monasticism Wicliffe contrived to get the Franciscan warden and fellows ejected from Canterbury Hall in Oxford by Archbishop Islip, who was dying, and himself made warden; but Islip's successor, Simon Langham, quashed the appointment, as violating the charter of foundation, and the Pope, to whom Wicliffe appealed, confirmed the primate's decision. We do not say *post hoc, propter hoc*, but then, and not till then, Wicliffe proclaimed "the Roman Church to be the Synagogue of Satan"; and thenceforth, having meanwhile accepted various pieces of preferment, including the rectory of Lutterworth, he turned his attack on the beneficed clergy and the Pope, insisting that every priest was bound to imitate the poverty of Christ; a contention not easy to reconcile with his previous assault on the begging friars, or with his own position as a well-beneficed clerk. His invectives were so coarse and violent that he was at last summoned to appear before the Primate and Bishop of London at St. Paul's; and here comes his "appeal to the laity." He appeared before his judges between the two most powerful subjects in the realm, the Duke of Lancaster and Percy the Lord Marshal, who began by insisting that he should be seated, to which Courtney, Bishop of London, naturally demurred, as being against all precedent for the accused in the presence of his judges. A sharp altercation ensued, the result of which shall be told in Hume's words:—"The Londoners, thinking their prelate affronted, attacked the Duke and Marshal, who escaped from their hands with some difficulty; and the populace, soon after, broke into the houses of both those noblemen, threatened their persons, and plundered their goods. The Bishop of London had the merit of appeasing their fury and resentment." This does not look as if "the laity, the Christian people themselves," responded very warmly to Wicliffe's appeal. The fact is that he appealed, then and afterwards whenever he got into trouble, not to "the people," but to certain magnates who shared his antipathy to the clerical order, and were powerful enough to screen him against the laws both of Church and State. He was treated on the whole with remarkable moderation by the ecclesiastical authorities, to whom his great patron, the Duke of Lancaster, at last advised him to submit, which he

did, seeing the danger of resistance, and retired to his living. He had a stroke of apoplexy while hearing mass in his own church at Lutterworth, and died at the rectory two days afterwards, December 30, 1384.

We have already explained the difficulty of ascertaining the real nature of Wicliffe's doctrinal ideas. The points, however, about which there is least room for doubt—as laid down in the forty-five propositions from his works condemned by the Council of Constance—are precisely those with which modern Protestants, especially Protestants belonging to an Established Church, can least be expected to sympathize. By a strange confusion of theological and feudal notions, he excoagulated the notion that the right of property is founded on grace, and—inasmuch as forfeiture of goods is confessedly the penalty of treason—is forfeited by sin, which is treason against God. On this comprehensive principle he "laid the axe to the root of sacerdotalism," as Dr. Farrar puts it, by insisting that every official act of priest, bishop, pope, or civil ruler in a state of mortal sin or predestined to reprobation (*præcursus*) is null and void; a view by the way against which one of the Thirty-nine Articles is expressly directed. In its temporal aspect this doctrine, which Huss afterwards adopted, "laid the axe to the roots" of all property and all government, and it was naturally regarded with as little favour by English statesmen as by the Emperor Sigismund at Constance. Endowments were forbidden by Scripture, and were due to "the instigation of the devil"—who occupies a remarkably prominent place in Wicliffe's programme throughout; "God is bound to obey him," and the extreme fatalism—or what was afterwards called Calvinism—is affirmed emphatically. Hume, who would hardly have agreed with Lord Plunket about Wicliffe's "statesmanlike wisdom," does not certainly exaggerate in saying that he "appears to have been strongly tinctured with enthusiasm," though it is not equally clear that he was "thereby the better qualified to oppose a Church whose chief characteristic is superstition." The superstition of endowments, which he at once enjoyed and denounced, has already survived Wicliffe for five centuries; and the chief theological superstition to which this great precursor of the Reformation "laid the axe" was reaffirmed, as we have seen, with peculiar emphasis two centuries after his death by the Reformed Church of which his admirers consider him the progenitor.

TUESDAYS AND FRIDAYS IN THE HOUSE OF COMMONS.

IT may have been observed by puzzled readers of the *Times* that the leading journal has got into a curious trick of regularly omitting the only important part of the programme of business in the House of Commons on Fridays. It gives the formal "Orders of the Day," and also the formal "Notices of Motion," which only come on at some unknown hour on a Friday night; but, with the rarest exceptions, it leaves out the "Notices of Motion on going into Supply," which, though technically mere amendments, are practically the special business of Friday sittings. For instance, on Friday in last week there happened to be a number of notices on the paper coming under this category, of which no trace whatever was to be found in the bill of fare printed in the *Times*. Mr. P. A. Taylor was to lend off with his motion in favour of opening national Museums and Galleries on Sundays, on which Colonel Beresford had given notice of an amendment declaring such a change not expedient; and there were also notices with reference to Irish currency, the trial of civil actions in the provincial centres of England and Wales, the election of local Poor-law Boards, the De Morgan petition, and other subjects. But not a syllable of all this was given in the list of Parliamentary business in Friday's *Times*, though it constituted the real business of the night. This is a blunder which the *Times* commits every week with an apparently complete unconsciousness of the absurdity of excluding from the programme the essential element of the proceedings on Fridays; and it is possible that there is perhaps a similar confusion of mind on the part of many of the public, which, as a rule, knows little of the way in which the House of Commons does its business. It may be worth while, therefore, to explain the rules of the House of Commons as to the motions on going into Committee of Supply on Fridays, as compared with the motions on Tuesdays.

It is well known that in the House of Commons certain days are set apart for considering the "Orders of the Day" (or matters which the House has already agreed to consider on a particular day), other days being reserved for original motions. Thus Monday, Thursday, and Friday are appointed for the Government "orders"; Wednesday for the orders of independent members; and Tuesday for notices of motion by the latter, although, when the pressure of business reaches a certain point, Tuesdays also are appropriated by the Government. On the other hand, Sir T. Erskine May points out in his work on Parliamentary Usage that, owing to the Committee of Supply or Ways and Means being always, by rule, the first "order" on Friday, Friday practically becomes a notice night, the Government having merely the residue of the sitting after all the notices and debates on going into Committee have been disposed of. There is, however, an important difference between private members' notices on Tuesdays and on Fridays, which is this—that on Tuesday the notice of motion is a substantial one; while on Friday it comes under the form of an

amendment on the motion "That the Speaker leave the Chair," or, in other words, that the House should go into Committee of Supply. Therefore on Tuesdays those who are in favour of the motion of which notice has been given vote "Aye"—i.e. a direct affirmation of a principle; while on Fridays they vote "No" on the question whether the Speaker shall leave the Chair, in order that the proposal which they support should be made a substantive motion, which is done whenever it is successful. Moreover, on Tuesdays there may be as many divisions as there are movers of motions; but on Fridays the House, by a sort of self-denying regulation, allows of only one division on the motion to go into Supply. This, however, does not prevent as many talks on different subjects as members choose to raise; and if a notice not yet reached is thought by any member to be inopportune, the object of the tactics is to secure a division being taken on some preceding one, so that no subsequent division can occur. This condition is fulfilled if the motion is negatived without a division; that is, if the Speaker has formally put the question and taken the voice of the House on it, a division not being challenged. One objector is enough to prevent the withdrawal of a motion; and a withdrawal is often prevented, not out of any ill-will to the motion itself or the mover of it, but only from a desire to avert a later division on some undesirable question. On the other hand, a division or formal putting of the question resulting in the rejection of the amending motion which has formed the subject of debate sets free the tongues of those who have already spoken to discuss any fresh topic. Otherwise the unity of the debate, in spite of the diversity of questions raised, would only allow of a single speech to each member. Accordingly the old hands never like to use a Friday motion merely to "call attention," without adding "and to conclude with a motion," for, without such a condition, the negating expedient has no place. If, however, a Friday amendment became the main question, then an amendment might be made on it; but such an event would generally involve a Ministerial defeat, and is therefore rare. On Tuesdays a member may speak as well as vote on each successive question, but on a Friday he can only speak once, unless the division or negating has, as we have explained, been interposed; so that Ministers, who have when the talk goes on from topic to topic no privileges of debate beyond those of any other member, have to reserve their answers till they can combine them in a single speech.

A place and priority for motions on these two days—Tuesday and Friday—is obtained by ballot, which is also used in giving priority on private members' Bills at the beginning of the Session. On each of these days—as indeed on every day, though the process is only of importance on those two days—a paper with numbered compartments lies on the table, and each member who has a notice to give puts his name against a number. Then the Clerk, putting the numbers into a glass, draws them out one by one by lot, and calls them out; and the Speaker, who holds the paper, names the member to whom that number corresponds, who thereupon gives his notice and chooses his day. At one time it was the practice to allow members to give notices for any day, however distant; but by a Standing Order it is now laid down that no one can fix a day further off than that day four weeks, the Easter and Whitsuntide recesses not counting. The Order Book cannot therefore be occupied in advance for a longer period than this, if the House is sitting without interruption. Thus the lucky first man of last Friday took Friday, July 6, for which he stands first. Those who are less fortunate may and do go on balloting from Tuesday to the next Friday, and from Friday to the next Tuesday, till they get a good position. It is always possible to transfer a notice from one of these days to the other, provided it is at a further date; but there is no power of anticipating a date already fixed. As we have explained, a member not the first in order is sure of his division only on a Tuesday, when he has also a right of reply, which no Friday man has. *Per contra*, a Tuesday man may have the wind taken out of his sails by an amendment, while the vote on the Friday motion must be a direct "Yea" or "No" on the words as offered and without change; for, as that motion itself is an amendment on that of the Speaker leaving the Chair, it cannot be re-amended on. Thus there was last Friday no chance of Mr. P. A. Taylor carrying his motion about national Museums and Galleries. Would there have been any modified conclusion reached or commission of inquiry directed if it had come on a Tuesday? Practically, however, a man is very lucky and happy to get in on either day.

In an ordinary way the modes of evading or superseding a question are by the adjournment of the House or of the debate, by a motion "that the Orders of the Day be read," by moving the previous question, or by amendment; but it will be observed that when the motion is to go into Committee of Supply this result may be secured by the voice of the House deciding in favour of the Speaker leaving the chair before the notice objected to is arrived at. In regard to the "previous question" there is at present an awkwardness which is pointed out both by Sir T. E. May, in his *Law and Usage of Parliament*, and by Mr. R. D. Palgrave, Clerk Assistant, in the Handbook for chairmen of public meetings which he has just produced. Sir Thomas describes the "previous question" as an ingenious method of avoiding a vote upon any question that has been proposed, but remarks that its technical name does little to elucidate its operation. In general the Speaker puts the question when there is no debate or after a debate is closed; but by a motion for the "previous question" this act of the Speaker may be pre-

vented. The words of the motion are, "That that question be now put," and those who wish to prevent its being put vote against the previous (which is really the latter) question; and if it is resolved in the negative, the Speaker is prevented from putting the main question, as the House has thus refused to allow it to be put. If the previous question be put, and resolved in the affirmative, no alteration in the motion, nor any further debate or motion for adjournment, is allowed, but a vote is at once taken. Hence it happens that the members who move and second the "previous question" have to vote against it, and indeed are usually appointed tellers for the Noes. It appears that in 1778 the Congress of the United States adopted the "previous question" in a negative form—i.e. "that the main question be not now put," which appears to be at least a more logical form than that used with us, though it has a different object, the effect of the "previous question" in America being immediately to suppress all further discussion of the main question. In the House of Commons the effect is only temporary, "that the question be now put," and it may be brought forward on another day. Mr. Palgrave recommends this form of words to chairmen of public meetings, and also for Parliament, as it shows clearly the object of the motion, and those who respectively support and oppose it vote "Aye" and "No."

While we are on the subject of Parliamentary rules, there is another point upon which some recent incidents seem to suggest that more efficient action is required on the part of the Speaker or the House. Although by the ancient custom of Parliament, as well as by law, a member may not be questioned out of Parliament for words spoken in Parliament, he is liable to censure and punishment by the House itself; and the House has the right, through the Speaker, to admonish, order into custody, or even expel, an offending member for misconduct. A happy change in Parliamentary manners has in recent times rendered the exercise of this authority unnecessary, except on very rare occasions; but, if there should be any more unpleasant scenes such as those which have lately occurred, it might be as well that the Speaker should take the opportunity of impressing on the House that it is responsible for the personal behaviour of its members, and is bound to repress displays of rudeness and temper which tend to create disorder and lower its dignity. We find in Hakewell's digest of "the old manner of holding Parliaments" such orders as the following:—"April 1604. Agreed for a Rule of the House; He that digresseth from the matter to fall upon the person, ought to be suppressed by the Speaker"; and also, about the same time, "Agreed for a general rule:—if any superfluous motion or tedious speech be offered in the House, the party is to be directed and ordered by the Speaker." And again, "No reviling or nipping words must be used," and "if any man speak impertinently, or beside the question in hand, it stands with the orders of the House for the Speaker to interrupt him and to know the pleasure of the House, whether they further hear him." In May 1610 a member having made a speech which was deemed impertinent, and "there being much hissing and spitting, it was concurred for a Rule, That Mr. Speaker may stay impertinent speeches." There are undoubtedly symptoms on the part of certain members of Parliament of the present day of a disposition to use violent language and to indulge in personal attacks which would seem to call for a prompt and vigorous intervention on the part of the Speaker.

THE MODERN SCHOOLMISTRESS.

IF Rip van Winkle could just now revisit the earth and wake up, not on his native mountain, but in London, he would see much that would surprise him; but we doubt whether anything would surprise him more than that new product of modern needs—the modern schoolmistress. It is true that woman in general would be a sore wonder to him, and it would be long before he recognized the beings whom he had last seen hooped and powdered in the perpendicular results of the millinery of to-day. Possibly he might be led to suppose that the comparative material nothingness of the women of the present time was a sign of their mental state, and that the reason why they made their heads appear as small as possible was a modest consciousness that their strength did not lie in that quarter. An inference so hasty would probably be corrected by a little conversation with any of the subjects of it; but, if it were not, an infallible cure would be found in an evening spent in "High School" society. When sleep overtook him—nay, till his sleep was well nigh over—seminaries and academies for young ladies were universal, and Miss Pinkerton reigned supreme. Iron gates and trim grass lawns led up to a shining door resplendent with a huge brass plate announcing in the most approved style of handwriting the purpose of the square-built house. The half-way wire-blinds gave an ineffable air of propriety and of the seclusion necessary to the mysterious "use of the globes" and other accomplishments of which prospectuses spoke so feelingly. Parents anxious to do their enlightened best for their daughters could but send them to these suburban retreats for a course of masters and blackboards in order to fit them for social life. How beautiful were the letters they used to write! How invariably "in music, in dancing, in orthography, in every variety of embroidery and needlework" were the Misses of fifty years ago "found to have retained their mental faculties!" Rip van Winkle might well be surprised if, with a senile tenderness for the past, he were still to cling somewhat to

the red brick houses, the broad gravel walks, the "dignified deportment and carriage," the two-and-two promenades of the academy on Chiswick Mall.

Miss Pinkerton is, however, not extinct even now. She exists in two forms—Miss Pinkerton pure, and Miss Pinkerton improved and improving. It is the pride of the former to hold to the old days; her "dear charges" have been committed to her to become accomplished members of society, and she has a shrewd suspicion that education in the modern sense is only a step removed from infidelity. She flourishes at Brighton, at Obeltenham, at Bath, and wherever else dull fashion and dull pulpit ministrations have made themselves a home. She admits no one to her intimacy save the spiritual adviser with whom, over the "parlour" tea-table, she discusses Low Church dogmas with a flattering deference. Inspired by him, she meets an invitation to send her pupils in for "the Cambridge" by the answer, "We desire that our dear children should grow up as modest violets and not as flaring sunflowers." But the march of intellect has carried off some of the sisterhood, and Miss Pinkerton improved and improving is already a considerable variety. She is found for the most part in large towns, or near them, forced, willy-nilly, to respond to a demand which she but half understands to add extra lessons and courses of lectures to her young ladies' education. She may be known by her indiscriminating zeal to rush into everything at once, and also by a prevalence of text-books and primers of the latest kinds in her drawing-room. Occasionally she outdoes herself by an effort after practical teaching of the most enlightened type, and engages a female celebrity to give a course of lectures on "Cellular and Vascular Tissue" to her girls, prompted thereto by a hazy idea that education somehow means something beyond the names of the rivers of Russia. What follows when the celebrity has been introduced to her class would be amusing, were it not a little pathetic. Rows of well-dressed girls, armed with notebook and pencil, confront the lecturer with a look of mingled curiosity and dismay. For a minute or two the pencils are in motion; but first one stops at the word "coll," and then all at the definition of "tissue." As the celebrity gets deeper the more showy girls relapse into a blank stare, the flippant ones begin to giggle, and here and there a well-meaning but too nervous subject may actually be seen to weep bitterly at the incomprehensibility of it all. The teachers themselves give up after a brave attempt to understand, and fall back into placid indifference; the Lady Principal matures plans for getting promptly rid of this terrible product of the higher education of women.

The superseder of Miss Pinkerton is a being of wholly different make and intention. She is the crown and flower of the modern "High School for Girls," without which no town can call itself complete. It is odd to see in how many points the sudden and much-needed reform of girls' education which these latter days have witnessed has resulted in providing for the sister an organization singularly like that which had already been found not too perfect in the case of her brother. The High School for Girls is, in fact, little else than a copy of the public school for boys. Latin is included as a necessary subject in the school course; music is optional; and though cricket and football have not yet been recognized by the Councils, a daily drill has taken the place of the backboards of an earlier generation. It is only natural that, as soon as a High School is established in a town, the staff which has to carry out the new programme should find themselves in the position of public characters. The prospectus is printed in the most approved fashion, with a list of the teachers and their honours. It is true that the mystical symbols which decorate a masculine list do not yet appear, and no head-mistress has up to this time put D.D. after her name; but she is sadly unfitted for her post if she cannot add the titles of "certificated in mathematics, political economy, science, and languages," and claim honours from Oxford or Cambridge, or both. With these qualifications it is no wonder that the head-mistress is rapidly becoming a great social power. The ordinary avenues to social success are not for her. She makes herself felt, not by her dress or her drawing-room, not by her sayings or her *savoir-vivre*. The field of her action is the prosaic little "office" in which she draws up time-tables, regulates the visiting masters, and receives the inquiring parent. The master, however distinguished he may be, the parent, however excusable her anxiety about her child, are both of them promptly reduced to submission. To the one, who may have come late to lesson, the special value of five minutes, from the High School point of view, is ruthlessly pointed out; to the other a firm, but courteous, command is given that her child must have "an absolutely quiet room for work," and goloshes and waterproof framed with a due regard to "the physiology of the growing girl." With a like regimental severity, the under-teachers, who are rarely admitted to private interviews, are reminded that a High School cannot listen to individual complaints or regard individual fitness, and that a special devotion to chemistry ought not to stand in the way of the teaching of English literature to a class of thirty girls. There is no corner into which the iron "system" does not penetrate. Even the terms' needlework is arranged beforehand in quantity and kind. Just as, in Plato's belief, the original archetypal Idea of a Bed existed in the mind of the universe long before its copy existed in the actual world, so the archetypal Quilt exists in the mind of the head-mistress at the beginning of term, and is gradually translated into fact by the weekly sewing-class.

And if the head-mistress is a great fact, no less in her own way is the assistant-mistress. Already numerous enough in many pro-

vincial towns, and in many corners of London, to make a separate little society for themselves, the whole of the time that these energetic young ladies can spare from the exercise-books is given to meditation and sweet converse upon the future of "the movement." The growing numbers of the school list, the whispers of parents, the examiners' reports (for already the High School has its examiners), are looked for or listened to with feverish anxiety. The old-fashioned gossip of governesses, which out of school hours was content to spend itself on the sanctities of this pupil and the untidiness of that, has given way to debates on the good and evil of Fröbelism, and a comparison of the standards of the three examining Universities. The assistant-mistress, in fact, keeps herself alive in despite of the piles of note-books, which often mean a night half spent in correction, by her enthusiasm for a new idea. As yet, it is true, she is sadly disorganized, and spends upon her work at home quite twice the necessary amount of time; but the cure for this will come when her own preparation has been more systematic and orderly than till now has been possible. As yet, too, she is perhaps a little too conscious of the importance of her own part in the work, and signs of mutiny have now and then been visible when the head issued an unpopular order. But who shall blame her? Has she not male examples before her—examples of successful mutiny in the very head-quarters of the public school system? Fortunately, however, this danger is not a great one, for the mutineers are few, weak, and inconsiderable, while the Councils are strong and vigilant. On the whole, the assistant-mistress may be said to be an admirable development of our time, and only to fall short of perfection in certain elements that time will bring—a firmer grasp of the multiplication-table and the Latin grammar, and perhaps a rather stronger sense of humour.

NOW AND THEN.

IT is the fashion at present in certain quarters to contrast the Tractarian and Ritualistic movements somewhat as follows. The former, we are told, was conducted by men of great ability and learning, and of manly common sense, which saved them from the folly of associating their doctrines with antiquated dresses and an obsolete ceremonial. The early Tract-writers addressed the intellects of their congregations, and were scornfully indifferent to the meretricious appeals to the senses on which those who claim to be their spiritual successors so much rely. And the sobriety of the Tractarians has had its reward. They have imprudently, the Church at large with their principles, and their right to hold their positions in the Church while zealously propagating their doctrines is no longer contested even by the most extreme of their opponents. It must be admitted that there is some truth in this way of stating the case, but it is very far from being the whole truth. It is, in fact, the opinion of posterity, and differs very widely indeed from the contemporary judgment passed upon the Tractarian movement. No man of mark among the Tractarians received the slightest recognition from the official dispensers of patronage. Dr. Pusey obtained his appointment before he had any connexion with Tractarianism, and has been neglected ever since. Keble would have ended his days as a country curate or college tutor if a private patron had not offered him a living of modest income. He was even refused the barren compliment of an honorary canonry in the cathedral of the diocese where he had spent his life. The gentle and gifted Isaac Williams died as he had lived, a poor curate in an obscure parish. And the greatest of them all in brilliancy and versatility of intellect, as well as in personal influence, if he had left the University and forfeited his fellowship by marriage, would probably have shared the fate of Isaac Williams. Nor was it mere neglect of which the Tractarians had reason to complain. They were the victims of a persecution in comparison with which that of the Ritualists is but child's play. The staid and learned men whom it is the fashion now to patronize and hold up before the new generation as examples to be imitated cut a very different figure in the literature of about thirty years ago. Let us give a few examples, as we find them reported in the *Times*: and they shall be chosen from various parts of England.

On the 26th of December, 1844, an excited public meeting was held at Torquay "for the purpose of considering what steps should be taken in reference to the innovations recently introduced into the services of the Church of England." The chair was taken by "a county magistrate," who "expressed in very forcible and feeling terms his sense of the importance of the present crisis in regard to the future destinies of the Church of England; it was this feeling alone which could have induced him, High Churchman as he professed himself to be, to take a step apparently in opposition to the Bishop of his diocese." A Mr. Philipps, "also a county magistrate," moved the first resolution in a long speech, in the course of which he "called upon the meeting to pronounce with one voice that the pernicious pranks of the Tractarian clique should no longer be tolerated; that the patience of their congregations had been already tried too long; and that the simple majesty of the reformed religion should be no longer defaced by idle mummeries, or the holiest doctrines of our faith insidiously perverted." "He adverted with much earnestness to the overtures which he knew to be making between the leaders of the Tractarians and the Romish hierarchy. He knew of their midnight conferences at St. Oseot. He had seen their letters. He commented with much force upon the fallacy of the argument for the sacrifice

from the rubrics; the garments there enjoined are an alb, a vestment, and a cope." We do not know whether this worthy county magistrate is still alive. If he is, we should like to know his opinion of the Ridesdale judgment. The "innovations" which had so alarmed the good people of Torquay were the use of the offertory and of the surplice in the pulpit, and a resolution in condemnation of them was "carried with only one dissident." On January 2, 1845, a great meeting was held in Exeter in consequence of a requisition "signed by 1,800 churchmen, the heads of families." The Mayor presided, and the meeting was attended by an imposing array of influential names. The quality of the speeches may be gathered from one or two extracts. One speaker declared that—

He was happy to say that, though old, his mental eyesight had not become so dim but that he could perceive the beauty of the countenance, the fairness of the complexion, and the well-proportioned form and figure of our excellent Church. (Cheers.) Yes, and through all the false attire, all the mystifying veils, and all the meretricious ornaments with which a certain class of half-Popish divines at the present day were pleased to dress her up. (Cheers.)

The orator went on to compare the surplice to "the vestments taken to the Jewish High Priests of old for examination if anything like a fretting leprosy infected them, that, if so, they might be burnt." It was in Oxford that "the plague had broken out to a fearful extent; and as some robes with lawn sleeves had not escaped the leprosy, they were afraid that the whole paraphernalia of our excellent Church would be infected with the same contagious distemper." After much more eloquence of the same description, the meeting adopted an address to the Queen in favour of such a revision of the rubrics as would effectually prevent the "revival of those obsolete laws and regulations by some of the clergy." Exeter was, in fact, in a state of riot for months. The rector of one of the churches, a near relation of the present Earl of Devon, had to be protected in his church and escorted home by the police, an infuriated mob of some 800 people "yelling and hooting" after them. The *Times* of January 1, 1845, describes in a leading article one of those disgraceful scenes:—

A dense mob was collected outside the church doors to escort the clergyman home, with jeer, hootings, and execrations. Meanwhile the church itself is profaned by the most irreverent tumult. Part of the congregation leave the building when Mr. Courtenay ascends the pulpit, and so great a noise prevails that he can scarcely be heard. The police have to form a bodyguard to protect him from something more than the noisy violence of shouts and hisses. The peace of the town is seriously compromised.

The magistrates refused to punish the rioters, and the end of it was that poor Mr. Courtenay was worried into his grave, his only offence consisting of wearing the surplice in the pulpit in obedience to the published wish of his Bishop. Nor was the excitement confined to the diocese of Exeter. The whole country was in a flame of insurrection against the surplice, and the metropolis naturally took the lead. The *Times* of March 19, 1845, gives a report of a great meeting in Middlesex, presided over by a certain Mr. Liquorish, "the senior churchwarden." One speaker declared that England was "deluged with Jesuits," and the *Times* reporter is careful to note the following:—

Several old parishioners, some of who were affected even to tears, came forward to protest against practices which drove them from the church where their fathers had worshipped, and where healing memories of holy things soothed, whilst they sanctified, their Sabbath visits. All this, they said, was changed by the practice of their rector. The son passed by the grave of his father; the widower of his wife; the mother of her child; to seek in some remote and unaccustomed house of worship that spiritual sustenance which the novel practices of their new rector had rendered unacceptable at their hands.

"The novel practices" which caused all this havoc of family affections, it may be well to explain, were two in number—the surplice in the pulpit and the chanting of the Psalms. But other places had even more doleful tales to tell. The leading newspapers of London had Special Correspondents scattered up and down the country, just as they now have at the probable battle-fields in Turkey. One of these reports that the intolerable "thorn in the flesh" of the Protestants of Ware was that "the minister, not the clerk, gave out the Psalms." The excitement and the riots culminated at last in animated debates in Parliament. Earl Fortescue opened a debate in the House of Lords, and strongly urged the necessity of revising the rubrics, with the view of making the offertory, the use of the surplice in the pulpit, and the chanting of the Psalms in parish churches illegal. Lord Brougham took part in the debate, and in a wise and statesmanlike speech deprecated the introduction of such subjects into Parliament. He trusted that their lordships would "on no account bring into Parliament matters which it might not be very easy to get out of Parliament. As a son of the Church of which the right reverend prelate (Bishop of Exeter) is a father, I join with him in the hope that these matters may never be brought into discussion in this House at all."

The press of England, with scarcely an exception, not only joined in the agitation against Tractarianism, but hounded it on. It would not even admit that the folios, as they were deemed, of the Tractarians were redeemed by any gleam of intellect or any nobility of character. The silliest of the Ritualists of to-day is treated with more respect than Dr. Newman and his followers were thirty years ago. "There is not," said the *Standard*, "a particle of true intellectual vigour, or manhood, or candour in his (Newman's) whole sect." The *Times*, indeed, strove manfully for a time to stem the torrent; but it, too, yielded to the current at last, and sought to control the tempest by going along with it.

The Bishops, it must be added, with but few exceptions, rivalled the platform agitators. Here is a posy from the episcopal charges of the period. The Tractarians were described as "superstitious," "zealots," "mystical," "malignants," "snakes in the grass," "Oxford heretics," "Jesuits in disguise," "tamperers with Popish idolatry," "agents of Satan," "a synagogue of Satan," men "walking about our beloved Church polluting the sacred edifice, and leaving their slime about the altars," "whose head," said one pious prelate, "may God crush!"

The cry then was that the Tractarians were fulfilling with too much strictness the obligations of the rubrics. Their opponents claimed not only the liberty of being lawless themselves, but of imposing their lawlessness on those who wished to obey the law. The Bishops of Exeter and London had said that the clergy were under a stringent vow to obey the rubrics. "We none of us are under such stringent vow," said Bishop Stanley of Norwich in the House of Lords, "for we never can obey all." It will hardly be believed that it was seriously proposed to remove the two former prelates from the bench in consequence of this opinion in favour of rubrical observance. Though but a generation from that exciting period in point of time, we are sundered from it in thought and feeling by at least two centuries. And what is the moral? Surely that these questions, however fiercely agitated for a season, will gradually settle themselves if left to run their course in the arena of rational discussion. A Public Worship Regulation Act thirty years ago would inevitably have resulted in the dis-establishment and disruption of the Church of England. But there were a few bishops then who kept their mental balance and did not mistake a transitory gust of superficial clamour for the mature convictions of the nation. There were also Chancellors and ex-Chancellors who saw and deprecated the danger of invoking the aid of Parliament and legislating in a panic. That danger has been unheeded by less sagacious and less prescient successors, whose mismanagement of a very ordinary controversy has landed us in a crisis of which the issue may be harmless or momentous according to the line of action adopted in influential quarters within the next few weeks. It is not yet, we believe, too late to remedy a grievous error. But there is no time to be lost, and the first step in the right direction is to deliver the Church from the uncontrolled domination of the lawyers. The Legislature has happily entrusted the Bishops with an incontestable discretion in the matter, and history will hold them responsible for the consequences. Let them take warning from their predecessors of a generation back, and not barter for the applause of the passing moment the good opinion of posterity—and not a distant posterity either.

THE BYRON MEMORIAL.

BYRON having once modestly expressed a hope of being "remembered in his line with his land's language," it has been thought necessary and appropriate to get up a street monument in commemoration of him, as if a more imperishable and impressive memorial for all time did not already exist in his works. This is stated to be the object for which nearly 3,000*l.* has been subscribed, and a marvellous collection of models of statues brought together for exhibition in an out-of-the-way corner of the Royal Albert Hall. The scheme was first brought before the public in July 1875, at what is called a "large and influential meeting," which was held at Willis's Rooms, under the presidency of Mr. Disraeli, "to consider and determine what means should be taken to found a national memorial to Lord Byron, the illustrious poet." It is perhaps significant of the class of mind characteristic of the working promoters of this project that they should think it necessary to proclaim, for the edification of the world, that Byron was an "illustrious poet," as if that were a fact previously known only to themselves. There is a well-known story of a collector of stamps in the North of England who, having had some official communications with Wordsworth, and representing himself as an acquaintance of the poet's, was asked to a party at Haydon's, where he entertained the company with such ejaculations as that "Shakspeare was a great man," "Milton was a great man," and so on, till at last poor Lamb was driven to ask to feel the gentleman's bumps, and had to be got out of the room, singing:—

Hey, diddle diddle, my son John
Went to bed with his breeches on.

Some people may feel inclined to join in this chorus over the present wonderful discovery of Byron "the illustrious poet." Lord Beaconsfield's speech at the meeting is given as an introduction to the catalogue of models. He begins by stating that he wishes to take this opportunity of attempting to draw the minds of his hearers "to the real object which they had before them." Then he recounted, also as if it was very much a novelty to the minds to which he condescended to impart the information, that "in the twelfth year of this century a poem was published by a young man which instantly commanded the sympathies of the nation"; that for twelve years he poured forth a series of "complete creations, distinguished by their power of expression, and by the decisive energy of their imagination," and that after these twelve years he died, "not only admired in his own country, but revered and adored by Europe." It may, perhaps, be doubted whether there is not a little exaggeration in this. Byron's reputation as a poet varied very much with different classes; and though of course he had a great influence, especially

on poetical natures, there were many who regarded his works with anything but reverence and adoration. The problem which the Chairman found he had to solve was "how it was that, after the lapse of half a century, they were met there for the first time in public meeting to devise some means of a national expression of admiration and gratitude to qualities so transcendent?" This might, the speaker said, be owing to the private character of Byron not having been exactly what it should have been, and to his erroneous views on some subjects; but "private character was scarcely an element in the estimate of literary genius"; and the poet was very young. And after this rather feeble exordium, the "illustrious statesman," as no doubt he will be called when it is some day proposed to commemorate him by some grotesque and ugly statue, went on to say that "We are met here to-day at last to do some justice to one of the greatest of England's sons." It is really a weak point of English public life that a very able and distinguished man should not be ashamed to get up and talk such balderdash, unless indeed he has the excuse of a secret purpose of showing his contempt for the silly busybodies who had entrapped him into such a situation. Justice to Byron is, in the highest sense, an appreciation of his works; and this has been and is still fully exhibited. The circulation of his writings has been world-wide, and so, in a way, have been the impressions they have produced. Still it may be admitted that is no reason why he should not have a monument; and Lord Beaconsfield had one irresistible reason for bestowing his patronage on the scheme, which was that Byron's son-in-law was his companion in a visit to Albania, and on this ground he "expressed his individual desire to see in some public place a semblance of this great spirit, so that the English people when they pass shall recognize one of the greatest masters of the English language."

There is no doubt some excuse for the eminent persons who, like Lord Beaconsfield, lent their names in the first instance to this hollow and ridiculous glorification, as it has turned out, of Byron, that they did so in pure ignorance of the sort of people who were the chief promoters of it, and of the way in which it would be managed. When Lord Beaconsfield expressed his "desire to see in some public place a semblance of this great spirit," it is impossible to suppose that he had any idea that the semblance was to be akin to the absurd and contemptible objects which are collected at the Albert Hall, or to be associated with a method of securing notoriety for various obscure aspirants to public notice who thought this a convenient method of advertising their names. The initial mistake made by the wire-pullers of the Committee, the rest of the members being merely nominal, was to offer the prize of doing the statue to unrestricted public competition. It is said that Mr. Woolner, Mr. Calder Marshall, and Mr. Durham were invited to join the Committee; but, if the promoters had had any idea of the self-respect of true artists, they would have made a choice of some one sculptor who had given such proofs of his power as to warrant confidence in what he would be likely to produce. As it is, no professional man of any position could think of stooping into competition with the sort of Italian stucco-figure men and New Road statuary who rushed into the arena. The Committee may not indeed have had sense enough to foresee the rubbishy result which was inevitable under the conditions of competition; but, after the melancholy experience of the first exhibition, their eyes should have been opened. Nothing could illustrate more glaringly the ludicrous incapacity of the persons who have had the management of this affair than the samples of modern sculptural art which have been sent in. It may be admitted that a diminished plaster model of a statue is not calculated to give an adequate idea of what the work might be when completed in bronze or marble; but the flagrant and offensive absurdity of the works which have been brought to light by this competition, even in its second development, clearly stamps its character. It may be perhaps too true that sculpture is not the most successful branch of British art, though we have some artists in that line of genuine ability; but it is difficult to understand how any one with the most primitive conception of art should ever have allowed such a vile representation of any department of it as that which is supplied by the designs for the Byron Memorial. Nothing could be more foolish in conception, or of a worse style of execution. There is hardly one in the whole lot which makes the faintest approach to a likeness of the poet, and the attitude and expression are usually of the most grotesque and fantastic kind. The drapery of the figure is also usually a mixture of classical and modern costume; and it is thought to be indispensable in order to enable the public mind to recognize, as Lord Beaconsfield phrased it, that Byron was "one of the greatest masters of the English language," that the bard should carry a pen or pencil in one hand, a volume for writing in the other, and a lyre under his arm, or hanging from his neck. One model is described in the catalogue only by the mention that "The figure in front of Pedestal represents Poetry," which it is actually necessary to say, because the figure in question might otherwise be thought to be an applewoman overcome with liquor. "Byron in an attitude of meditation" is evidently dropping off to sleep; "Lord Byron descending from Parnassus" wears a costume of the French revolutionary period, and tall, gaping Hessian boots. "The idea of a design to commemorate Byron in the double character of English poet and Greek patriot" represents him in a sailor's dress, with an Attic mantle. In one case he has the air of a defiant Ajax, in another he wears a low-necked dress, and apparently has bare legs or skin tights. It need hardly be said that he is always awfully curly, this part of him having evidently been studied from the

wax images in the hair-dressers' windows. Even the model which has been chosen for execution in bronze, though not so clumsy and absurd as most of the rest, presents merely a spruce, naphy-pamby young fellow, without the faintest resemblance to Byron, except, perhaps, that he is sitting on a rock, and is supposed to be looking over the sea. There are, no doubt, some very bad statues in London already; but it will be disgraceful if no better one than this can be found to perpetuate the semblance of Byron. That such a paltry, mechanical piece of work should be set up in a public place as an example of what English sculpture has now come to would certainly be to cast a very unfair stigma on this branch of art. It is to be hoped that some of the distinguished persons who are on the Memorial Committee will interfere to prevent such a scandal as that which would be involved in allowing money to be wasted, and public taste outraged and discredited, by the permanent exhibition of such an inferior work. It was natural that no artist of the slightest reputation should enter into such a competition; and the result has been, not to encourage talent, but to offer a premium to common slop-work. It is surely not too late to reverse the unfortunate decision which has been come to. If it is persisted in, those who have been beguiled into promising subscriptions will be fully justified in withholding them.

FINANCES OF OUR GREAT TOWNS.

THE future of England is year by year becoming more and more dependent on the condition of our towns. Already the urban population largely exceeds the rural, and, according to the last Census, it is increasing more than twice as fast. Assuming, then, that the forces which are now attracting the people from the country to the large centres of industry continue in active operation, and that they are not counteracted by political changes or by inventions that will entirely transform the methods of agriculture, it is possible that the time may come when England will consist of a multitude of towns divided one from another by parks and gardens. Whether that state of things will ever actually be reached or not, it is evident that the tendency of modern commercial and industrial development is to approximate towards it. Hence the surpassing importance of urban organization. It is manifest that the massing of the population in towns tends to augment inordinately the cost of administering these. It brings together all the agencies injurious to health—overcrowding, bad air, noxious vapours, filth, destitution, intemperance, vice, and crime; it removes the green fields, and with them the means of healthful exercise and innocent recreation, beyond the reach of the very young and the very old, the busy and the poor; and it renders necessary the bringing of water from a distance, the providing of artificial light by night, and the protection of life and property from violence and accident. Thus a heavy expenditure becomes imperative, and the progress of science, the spread of more enlightened views, and the triumph of democratic principles tend to increase it. In some countries, accordingly, more particularly in the United States, the extravagance of city governments is already straining the national institutions. Here in England, however, we have safeguards which are wanting both where there is a great and long-continued influx of foreign immigrants, and where local self-government is a plant of recent growth. Our urban populations are everywhere homogeneous. They have inherited all the aptitudes acquired by centuries of free and orderly government, and by the training of successive generations in the management of their own affairs. And in the last resort they are subject to the control of a Parliament which is at once experienced in financial administration, and properly regardful of the claims of local autonomy. These are great advantages. Have they kept our towns from compromising their future by engaging in expenditure which they cannot afford? The annual Local Taxation Returns which have just been issued enable us to answer this question. It would obviously be impossible within our limits to deal adequately with those returns as a whole. We propose, therefore, to take the cases in which the influences at work on urban populations may be supposed to be most highly developed. Outside the metropolitan area there are four towns in England which at the period of the last Census contained more than a quarter of a million of people, and at the same time were municipal boroughs. Thus they enjoy local self-government, they are inhabited by vast populations, and are possessed of immense wealth. Of the four one is a seaport, the other three are manufacturing centres; but the staple manufacture of each is different. The four towns are Liverpool, Manchester, Birmingham, and Leeds, and in them we may fairly expect to find the tendencies of English urban life fully developed.

Liverpool is the most populous of English provincial towns; in round numbers it contained six years ago half a million of inhabitants. It is also the wealthiest, its rateable value being somewhat over two and a half millions. Unfortunately, we are not able to ascertain the entire income and expenditure of all the various administrative bodies in the town, since the poor-rates of Liverpool are not distinguished in the return before us from those of the whole county of Lancaster—a very serious defect which greatly impairs the value of the publication, and ought to be repaired next year. Leaving the poor-rates out of the question, then, we find the total receipts from all sources for the year 1875-6 to have amounted to the enormous sum of 3,280,000*l.*, or nearly three quarters of a million more than the total rateable value of the property of the town. We hasten to explain,

however, that only a small part of this immense sum was actually raised on the property of the town. Over a million was the proceeds of tonnage and ballast dues levied by the Mersey Docks and Harbour Board; over three-quarters of a million more was borrowed by the same authority; considerable additional sums were derived from other loans, from Treasury subventions, from rents and sales of property, and from fines on the granting of leases. At the outset, therefore, we subtract 1,092,974*l.*, the amount borrowed, which leaves the income raised within the year 2,187,227*l.* From this sum, again, we have to deduct 43,887*l.* contributed by the Treasury. Of what remains more than a million, as we have already said, comes from tonnage and ballast dues; over a quarter of a million was paid for water and gas; and large additional sums were the proceeds of other tolls and dues, of rents, and fines. The actual revenue raised by taxation, exclusive of poor-rates, the amount of which is not given, is thus reduced to 353,710*l.* This amounts to almost one-seventh of the rateable value of the borough, or to somewhat less than three shillings in the pound, to which, however, has to be added the cost of poor relief, which would raise the rate probably to between four and five shillings in the pound, or to more than 20 per cent. of the rateable value—an enormous taxation certainly, when it has to be added the cost of the Imperial Government. The sums we have deducted, the reader will perceive, are not, in any true sense of the word, taxation. The expenditure on the harbours and docks, for example, resembles rather the outlay of an improving landlord than the expenditure of a Government. So, again, the gas and water rates are really payment for services, just as the income of the Post Office is. And, of course, rents and fines nobody would confound with taxation. The expenditure from these various sources may or may not be extravagant. Into that point we are not now examining. What we wish to make clear is that the income itself is not derived from taxation.

Manchester is the next most populous town, having, in 1871, had 351,000 inhabitants. It is also the next wealthiest, its rateable value being 2,125,757*l.* Its income from taxation proper amounted to 323,437*l.*, which is not far short of that of Liverpool. Again, it will be understood, we exclude poor-rates, as not being ascertainable. The total expenditure from all sources amounted to no more than 1,512,813*l.*, or less than half the Liverpool total; the difference, of course, being due to the fact that Manchester is an inland town, and that the Liverpool outlay on docks is quite as much for the benefit of Manchester as for that of Liverpool itself. We need not go through the several items of receipt. It is to be noted, however, that the water and gas rates yield together about half a million a year, showing that the borough is not only a taxing authority, but that it is also a great manufacturer and employer of productive labour. The population of Birmingham is but slightly smaller than that of Manchester; its rateable value is, however, considerably less. Yet its total expenditure is greater, amounting to 1,810,933*l.* From the way in which the returns are made up it is not possible to ascertain how much of this sum is derived from taxation. We are not told why the information is not supplied in this instance, or what is meant by the heading "all other sources." It is clear however that, if the publication is good for anything, it ought to give so essential a detail as this. We find at the same time that 659,288*l.* was raised by loans, and 12,524*l.* contributed by the Treasury. Lastly, we come to Leeds, whose population six years ago but just exceeded the limit we have drawn, and whose rateable value is slightly under a million. Its total expenditure amounted to 823,629*l.*, of which 122,541*l.* was raised by taxation. In conclusion, we find the total outstanding debt of Liverpool to have amounted to 18,573,074*l.*, 14,400,000*l.* of this large sum being on the security of the tonnage and ballast dues; the debt of Manchester amounts to about five millions; that of Birmingham to 1,500,000*l.*; and that of Leeds to 3,185,000*l.* In every case it will of course be understood that we exclude the poor-rates and the debts contracted on their security, as they are not distinguished from those of the counties in which the boroughs are situate. Both the taxation and the debt, we would observe in concluding, are heavy, yet they are not such as to compromise the future of the towns whose finances we have been considering, or seriously to enhance the cost of living. The expenditure is incurred for the most part in works of public utility, designed to make the towns more healthy, to improve the education of the people, and to increase the security and comfort of life. Whether those works are always economically conceived and executed is another question. Our object here is to ascertain, not whether sanitary reform is pushed forward with sufficient diligence or planned with intelligence, but whether, in endeavouring to effect it, the solvency of the towns has been endangered. We may safely say that it has not. With the exception of Liverpool, for example, the debts in no instance reach four times the rateable value; and in Liverpool the bulk of the debt is secured, not on the rates, but on special dues. It is to be borne in mind, too, that a large part of all the loans was contracted on the security of tolls and dues.

It is to be regretted that the returns do not clearly distinguish between the different kinds of expenditure incurred by our towns. A very large part of it is, as we have said, in the nature of investment and of improvement of property, as, for example, the outlay on docks, harbours, gas, and water. Under the same head we may place the works undertaken in execution of the Artisans' Dwellings Act. This is an increasing item, and one which requires to be closely watched. It would be desirable, therefore, to classify it distinctly.

Another branch of expenditure is purely sanitary, a third is charitable, a fourth educational, and a fifth strictly municipal. It would add very greatly to the value of the returns if these various items were set out intelligibly. It would enable us to detect in which of them the greatest tendency to extravagance and abuse may lurk, and consequently to devise safeguards in time. The present abstracts are almost worthless for these purposes.

THE ROYAL ACADEMY.

v.

THE remaining galleries at the Royal Academy have, on the whole, less of interest than those of which we have already given some account; and some works of importance contained in them we have already noticed together with other works by the same painters. Taking the landscapes in Gallery No. V. we may notice for its pleasant effect and clever painting Mr. Cecil Lawson's "View from Don Saltero's, Choyne Walk; temp. 1770" (396). The impression produced is rather that of a Dutch river scene than one on the Thames; but the Thames may possibly have worn a Dutch aspect in 1770. Mr. Taylor's "The Cliff, Southwold," is a clever work, cast in a somewhat hot and affected scheme of colour. Mr. Robert Leslie's "Calm off the Foreland" (414) is quaintly true; and Mr. Hodgson's landscape, with the motto "Their Haven under the Hill" (428), is excellent in the truthfulness of the water and the atmospheric effect. Mr. Vicat Cole's "Arundel" (432) is an impressive rendering of a river scene, with boats lying opposite to a picturesque group of houses, and a deep brilliant glow in the sky at the back. Close to this hangs Mr. O'Connor's "Newcastle-on-Tyne" (431), which is pleasantly quiet in colour and admirably correct and forcible in drawing. Mr. Boughton's "Homeward" (452) is a very delicate piece of landscape, somewhat too green in colour. An unfinished picture of "The Street and Mosque of the Ghoreegah, Cairo" (454), by the late Mr. J. F. Lewis, R.A., serves to show how much art has lost by the painter's death. Among the portraits may be noticed a fine work by Mr. Oulless—a portrait of Mr. William Fane de Salis (402)—which differs from the painter's ordinary work in showing marked traces of Sir William Boxall's influence; Mr. C. E. Hall's clever portrait of the Master of Sinclair (429), and Mr. Hubert Herkomer's portrait of Mrs. Henry Mason (417). This is a work which grows upon one the more one looks at it. The face and figure are excellent in truthfulness and relief, and the landscape in the background is full of atmosphere. Mr. E. E. Waller's picture (called "Home?" (453) is remarkable for its pleasing truthfulness, and for the pathetic feeling given to the figure of the young man who returns to find "no sign of home, from parapet to basement." Mr. Bridgman's "Pharisee and Publican" (391) is a fine effect of quiet colour, but the figures seem wanting in character. "A Basket of Roses" (338) is a charming example of M. Fantin's work. Gallery No. VI. contains Mr. Poynter's diploma picture, "The Fortune-teller" (503), a naked woman sitting at the edge of a bath while an old crone looks into a crystal globe. There is a disagreeable hardness of realism, and an utter want of beauty both in composition and colour, and the drawing of one of the naked figure's arms is false. The painting of the marble makes one long to go and look at some of Mr. Alma-Tadema's work. In this room are found two martial pictures by Mr. Crofts (407, 528), of which we prefer the second and smaller one. In the first, "Oliver Cromwell at Marston Moor," there seems to us to be a certain want of movement. Mr. John Charlton's "Rescue" is a very forcible representation of a stable on fire, in which the agony of the horses would be too painful but for the suggestion that help is at hand. Mr. J. Watson Nicol has two pictures skilfully painted—"When a Man's Single he Lives at his Ease" (516), and "Looking up an Old Acquaintance" (532). The first, a man clothed in green, sitting and smoking by the side of a table with a flask of wine on it, his legs stretched out in delightful self-complacency, is full of quiet humour; and there is a distinct meaning distinctly expressed in the second, a man in a black surcoat bound with a yellow scarf selecting one from among several swords which may be Andrea Ferraris. Mr. B. W. Leader's rendering of "A Fine Autumn Night, Lucerne" (508), is extremely pretty, but the effect is somewhat too bright and distinct for moonlight, and the general effect is marred by the artist's flickering touch, which, to a greater extent, disfigures his artificial representation of the "Valley of Clear Springs, Lauterbrunnen" (1348) in Gallery No. X. Mr. Albert Goodwin's "Baptism of Flowers" (509), in Gallery VI., is attractive, although wanting much in gradation; and Mr. G. Reid's "Gorse in Bloom" (519) is somewhat spoilt by its extreme sketchiness. Mr. Oulless's fine portrait of the Recorder of London (495) and Mr. Watts's eccentric but poetical "Dove" (566), we have already mentioned. Mr. Frederick Morgan's "Parting Shot" (474) has much charm, and Mr. H. Moore's "Loss of a Barque in Yarmouth Roads" (489) is a fine and stirring sea-piece.

Gallery VII. is remarkable for three foreign works of much excellence. Signor Tito Conti's "The Introduction" is an exquisitely careful and true piece of painting in the French school which has reproduced the combined breadth and minuteness of the Dutch masters. A "Scene in Rome" (623), by T. Ethofer, is one of the happiest imitations we have seen of Señor Fortuny's manner; and Herr Munthe's "Winter Evening" (644) differs agreeably from the generality of this painter's well-known winter scenes in possessing more movement than is usual with him. Another

remarkable picture, by a British artist, is Mr. MacWhirter's "Over the Border" (588). There is immense expression in the figure of the horseman flying at full speed to gain safety, and the luminous evening sky in the background is completely true. Mr. T. M. Rooke's triptych of "The Story of Ruth" we spoke of with praise in our first article. The first of the series is, to our thinking, the most pleasing, in that it is free from the hints of affectation conveyed in the other two. Mr. Rooke has evidently been influenced by the style of Mr. Burne-Jones, from whom he may no doubt learn much, at the risk, however, of catching certain disagreeable tricks to which we have before made reference. Directing attention to Mr. O. W. Wyllie's "Digging for Bait" (577), Mr. Seymour Lucas's "Intercepted Despatches" (573), and Mr. Briton Rivière's "Lazarus" (589), we pass on to Mr. Boughton's "Snow in Spring" (640), a composition charged with tenderness, in which the only fault we can pick is that snow so scattered as Mr. Boughton has represented it could hardly lie unmelted on the ground.

The Lecture-Room should perhaps be excepted from what we have said as to the want of interest in the later compared with the earlier galleries of the Academy. Here are to be found works of importance both from tried and comparatively untried hands. Among the latter, Mr. R. W. Macbeth, in his "Potato Harvest in the Fens" (1031), has done much to increase his rising reputation. The picture is full of life and vigour; rustic types are made pleasant and interesting without any affectation or theatrical departure from truth, and the scheme of colour is attractive. The work would be more completely satisfactory if some of the heads were more finished. Near to this is Mr. Yeomans's large picture of "Amy Robsart" (1027), which shows the discovery of Amy Robsart's body at the bottom of a flight of stairs by Forster and a servant. The expressions and attitudes of the two men are well imagined and executed; what gives a certain disagreeable effect to the work is the hot colour, which contrasts too strongly with the white figure lying at the foot of the steps. Mr. Hubert Herkomer has "Der Bittkrang" (916), a picture of peasants descending a hill in prayer for the harvest, which is fine both in feeling and colour. Mr. Brett's "Mount's Bay" (946) is an unhappy specimen of this painter's work. Every object in the picture is worked out with equal distinctness and brightness, giving as a result a composition in which there seems to be no regard for differing values. The lichen and other growths on rocks at a considerable distance are as clearly marked as those in the immediate foreground, and throughout the picture there is no relief from the hot sun that beats down on the sea, which is painted with unaccustomed hardness. Mr. John Collier's "The Aiguille Verte from Argentière" (971) is a work fine in composition and colour, and very true to its subject in general effect. The foreground is exact and careful without over-elaboration, and the distance between this and the Aiguille is well expressed. The only fault to which we would call attention is that the mist which "puts forth an arm and creeps from pine to pine" on the mountain-side is in one place so solid that it might be taken for part of the ice-slope. Mr. W. L. Wyllie's "Tracking in Holland" (985) is a piece of daring effect, marred by the false drawing of the figures. Among many small pictures hanging near this we may notice for its care and pretty effect Mrs. Crawford's "St. Patrick's Servant" (978). Mr. Farquharson's "When Snow the Pasture Sheets" (1017) gives perhaps the best rendering of a snow-covered field to be found in the Academy; and the effect of the light coming through a dark line of trees is admirably true. Mr. P. Degraeve's "The Charity School" (1038) gives, in a somewhat sketchy manner, a singularly humorous aspect to a pleasant collection of incidents. "The Battle of the Alma" (937), by Mr. Philippoteaux, is remarkable for its immense movement and harmonious grouping of many incidents of a battle-field. Mr. A. Stuart Wortley's "Grouse-Driving" (932) is a careful rendering of a scene which will be chiefly interesting to sportsmen. "Coming South, Perth Station" (922), by Mr. Earl, is a perpetuation of a style of so-called art of which we fondly hoped we had seen the last. Mr. Luke Fildes is poorly represented by "Playmates" (1059), to paint which he would seem to have borrowed Mr. Poole's palette. Mr. Alma Tadema sends a very quaint and pretty picture of a child wisely studying a big book, called "A Blue-Stocking" (974). Mr. Otto Weber's "He's Cast a Shoe" (957) has much cleverness; as has, in a different direction, Mr. Wooldridge's "Winter Roses" (969).

The last gallery of oil-paintings, No. X., contains "No Hope" (1335), by Ferdinand Fagerlin, a fine and pathetic cottage scene, which may be compared to its advantage with Mr. Faed's attempts in the same direction. In "No Hope" there is no kind of straining after effect; the desired impression is conveyed with a sombre and tender truth which is far more satisfactory than the stately prettiness in which Mr. Faed is wont to indulge. Mr. Poindestre's picture of buffaloes clearing the canals of the Pontine marshes from weeds (1340) is an odd, but by no means unpleasant, work; and M. Adrien Moreau's "Dancing Bear" (1325) is a picture of much cleverness, painted in a manner rather too spotty. Mr. Burgess's "Licensing the Beggars—Spain" (1377) is a happy and dramatic example of the painter's work. Mr. Hennessy's sober and pathetic "Notre Dame des Flots" we have already mentioned. Sir R. P. Collier's "Scene near Argentière" (1380) is a most true and successful rendering of a scene to which stream, foliage, and glacier combine to give a pleasant effect. Sir R. P. Collier has made a special study of glaciers; and we cannot think of any professional painter who catches their peculiar form and colour with equal happi-

ness. Mr. Orchardson's "Jessica" (1388) is to our thinking spoiled by a dirty and unpleasant colouring, just as is his otherwise graceful "Queen of the Swords" (174) in the Great Gallery. The best picture by Mr. P. Graham in this exhibition, and we are inclined to think one of the best he has ever painted, is found in the last room. Nothing could be more true and more full of suggestion than "The Gently Heaving Tide" (1371), in which we see a billow of wonderfully transparent green water swirling up over weed-covered rocks, while sea birds hover on its surface. So true is the effect that one can almost hear the screams of the birds and the liquid voice of the weltering sea.

We may take this occasion of noticing the third series of Mr. Henry Blackburn's *Academy Notes*, which contain well-selected sketches of the pictures, with brief and appropriate comments, and will be found useful both as a guide and a reference. An *Illustrated Handbook to the Supplementary Art Galleries of London*, edited by Mr. Pascoe, is an imitation, and a very miserable one, of Mr. Blackburn's ingenious notion. The sketches are poor and coarse, and the quality of the letterpress can be judged from this extract concerning a well-known picture-gallery:—"Much consideration is shown for the personal comfort of visitors, who, in the well-ordered restaurant on the ground-floor, will find more than ordinary attention paid to their individual wants, and with (sic) an admixture of civility not commonly met with in public places."

REVIEWS.

PALMER'S TRANSLATIONS OF ORIENTAL POETRY.*

THE appearance of these two volumes, composed mainly of translations from the Arabic, with versions of some of the odes of Hafiz and others, and with some original pieces, may set readers thinking whether Oriental poetry can ever be made more popular in England. Sir W. Jones wrote an essay in which, without derogating from the merits of his favourite classical authors, he dwelt on the ample materials and the rich and creative invention of Persian and Arabic poets. They have, it may be admitted, the command of copious, refined, and elegant languages. The physical aspect of their country is varied, and it makes them familiar with nature in her sublime and terrible moods. The climate is proverbially favourable to voluptuousness and love. There is no want in Oriental history of events that stir the blood and fire the imagination. And, putting aside a vast crowd of mere versifiers and imitators, Persia and Arabia have produced works which competent judges declare to be instinct with deep and genuine poetic feeling. Why then should not Leila prove as captivating as Lalage, or Hafiz rival, or at least approach, the delicacy and refinement of Horace? The answer depends on a variety of considerations. Apart from the linguistic difficulties of Arabic, and the comparative isolation and remoteness of Persia as a country, Eastern poets are apt to run into extravagance and bombast. Their metaphors are forced; their images unnatural; their style often wearisome; their allusions obscure; their erotic pieces impure and offensive; and their sublime passages of that kind which is rather less than one step from the ridiculous. Readers who have a store of good poetry at their own doors will not take the trouble to make excursions into regions protected by barriers not easily traversed, in order to gather fruits which, if they do not turn to ashes, are either mawkish and insipid or too highly flavoured for the European palate. To enter into Oriental poetry thoroughly, to find bits of Homer in the Shah Namah, to detect Alceus and Anacreon in Hafiz, to recognize in Sadi a kindred spirit with Horace, will always remain the privilege of a few. These remarks must not be taken in disparagement of Professor Palmer's praiseworthy attempt to bring home to English readers the merits of those Arabian and Persian writers to whom he has devoted so much labour, and whom no one is better fitted to interpret. We shall begin with his gilt-leaved volume which displays beautiful Arabic characters on its cover.

Beha-Eddin Zoheir, like Milton, was a secretary as well as a poet. He was attached to the service of a prince descended from Saladin, who, after divers vicissitudes, became ruler of Egypt. The poet enjoyed his friendship, and the reputation of being the "best writer of prose and verse" and the "best calligraphist" of his time; the latter distinction, we fear, not being always assignable to poets at this day. Professor Palmer has written a preface to his author in Arabic, for the edification, we apprehend, of native scholars at Cairo and Damascus, and we readily admit that the style and sentiments, as far as they can be preserved in the English garb, justify the translator's praises of his author's originality and simplicity. The poems, some of which are very short, while none are of the length of the *Giaour* or of a single canto of *Marmion*, number four hundred and fifty. They may be roughly divided into—1. Panegyrics or congratulatory odes; 2. Amatory sonnets; 3. Poems addressed to friends and acquaintances; 4. Epigrams and short satirical pieces. Of the first kind are various odes in praise of his master, or of Amira when they had returned

* *The Poetical Works of Beha-Eddin Zoheir, of Egypt. With a Metrical English Translation, Notes, and Introduction, by E. H. Palmer, M.A., Lord Almoner's Reader and Professor of Arabic, Cambridge.* Cambridge: University Press. 1877.

The Song of the Reed, and other Pieces. By the Same. London: Trübner & Co. 1877.

from the wars or had assumed the administration of provinces. The second division, as might be expected, abounds in dark eyes, perfumed lips, statures that resemble lances, cheeks of roses, and teeth of pearls. But these expressions occur in the first class also; and they have one peculiarity to which Professor Palmer draws attention and which his erudition does not satisfactorily explain. In erotic verses, he tells us, Eastern poets employ the masculine gender whether the subject be male or female. With Leila and Zuleika this may be a more recognition of woman's rights to an equality with men. But there is something jarring and unpleasant in the use of bent amatory language to the son of Al Malik the Perfect, to the Amir Nazir-ud-din Al Lamti, or to Ibn al Ghulam. Sometimes it is difficult to make out whether the object of the poet's adulation is a man or a woman, and we gather from the preface that even the translator himself is at fault on this head. Poems to friends and acquaintances are, however, not all of the sort which recall unpleasantly the Second Eclogue of Virgil, and possibly such expressions at Oairo and Damascus may have been construed as the lawful utterances of gratitude for past favours and respect to high office. Invitations to picnics and to wine and pleasure parties, condolences on the deaths of friends, on illnesses and disappointments, appeals and answers, are, however, free from such blunders, while several are remarkable for elegance and point. The fourth or last class show that the poet was as irritable as most of his tribe, or else that he had the ill-luck to be the constant prey of intrusive acquaintances. There are a dozen or more pungent poems on "bores" and fools, and others on negroes, tiresome old women, reprobates, wretches, busy bodies, and designing girls. In one, the indignant author threatens to cut off the ears of a slanderer and brand him on the brow; in another, a friend is blamed for keeping a useless mare that no one can ride; an atheist comes in for a sneer which vindicates the poet's orthodoxy, and which without a note would be quite unintelligible; and an antiquated beauty is very properly warned that she had better desist from aping the airs of her juniors and discard dye and pomatum, as she can never appear in any better light than an old volume with a new back. The translator's notes, when we get them, are brief and yet perspicuous; but our only complaint is that they are too few in number. It is not every one who knows that Hatim Tai is the type of Oriental generosity and hospitality, and who remembers that this chief served up his best horse rather than allow a guest to go to bed supperless; nor can we be quite sure whether Tuabat-Sharan may be the brigand mentioned in one of Mr. Gifford Palgrave's clever essays on Eastern questions. Mr. Palmer is doubtless quite right in not making his versions too literal. Easy, and not stiffness, is what we look for in such a work, even at the sacrifice of some accuracy. But occasionally his desire to paraphrase his author carries him too far. Such expressions as "benedicite" for blessing, a "darkie" or a "nigger" for a negro, an "etienne," are out of place altogether, and Mr. Palmer must be the first Oriental scholar who has selected "Count" as the equivalent for the word Sahib. We have said little of Mr. Palmer's qualifications as a poetical translator. If not quite of the first rank, they are certainly of a high class. For ease and facility, for variety of metre, for imitation, either designed or unconscious, of the style of several of our own poets, these versions deserve high praise.

But it is time to allow the translator to exhibit his favourite author in the dress given to him. The following will remind readers of a well-known ballad by Mrs. Norton, now Lady Maxwell, which thirty years ago was often sung:—

They called my love a poor blind maid,
I love her more for that, I said.
I love her, for she cannot see
Those grey hairs that disfigure me.

In the English ballad the lover, and not the maid, is blind; but the resemblance is striking. Out of a panegyric to the Amir Mejed Uddin El Lamti we select the following stanzas, which preach a morality not unworthy of a Christian warrior:—

All time is a season of fasting
To thee who art righteous and good,
And life is a Ramadan lasting
To one of thy temperate mood.
When the reins of thy charger thou takest,
No rosary else dost thou need;
And a mosque for devotion thou makest
The back of thy steed!

A picnic on the Nile, after describing the water-wheels, the carpet of flowers, and the ripples of the river, introduces among the company

a reverend divine,
And here a man who worshipped wine;
Here, very grave and sober folk;
There, others who enjoyed a joke.

And again:—

And Coptic monks, you understand,
A learned but a jovial band;
And pretty faces, too, were there,
The owners kind as they were fair;
And one who from the Psalter sang
In tones that like a Psalter rang.

Nile scenery is somewhat tame and flat, as the Delta must be; but here is a good epigram on the weather:—

The summer with untimely heat
Has come upon us far too soon.
Oh! April, this unwonted feat
Will leave no work at all for June.

Out of the many denunciations of the genus bore we select one on the friend who holds fast to the poet, and who

has no soul, but on the whole
Rocks do not often have a soul.
Meet him where-so'er I may,
I count it an unlucky day.

We do not know whether our winter visitors to Egypt will quite endorse the following:—

No city like Cairo I treasure,
Of all the fair cities I know.
There's nought like its life full of pleasure
And wealthy contentment, I trow.

In his travels the poet had to seek a night's lodging with an Armenian, and he breaks out afterwards:—

Night, toil, and travel brought me 'gainst my will,
I cannot bear a part of all my woe:
Your speech, the water-wheel, the drum, the mill,
And which to grumble at I do not know.

An elegy to the poet's son is presented to us in the metre which one of the greatest of memorials to a departed friend has made familiar to this generation. Indeed a reader might be pardoned for turning over *In Memoriam* in the expectation of finding in it the following stanza, which is one of twenty-seven moulded very much alike:—

This thing is hard for me to bear,
That when-so'er I turn my face,
And search in thy accustomed place,
Alas! I do not find thee there.

In contrast to this comes a drinking song of eleven stanzas, of which the first is a fair sample:—

Come, sing to me, my comrade, sing!
And fill for me the sparkling cup;
For, ere the crier's call shall ring,
I woe, we should betimes be up.

The crier is of course the muezzin. Some excellent liquor, praised in another song, would, we are told,

have made an old man young,
Have made you look on wrong as right,
Have made you look on right as wrong.

An elegy on one of his brothers, a very early attempt of the poet, cannot be quoted at length. We have no room even for a sample. But it does not rise to the level of the celebrated lines of Catullus:—

Tu mea, tu meos fregisti comoda frater;
Tecum una tota est nostra precepta domus.

All the above, it ought to be remembered—elegies, odes, fugitive pieces, sonnets, quatrains—are the production of a poet who died three-quarters of a century before the birth of Chaucer, and forty years before the date when Dante commenced his great work. As Mr. Palmer observes, the tone often reminds us of our own writers of the seventeenth century.

The second and smaller volume is made up of selections from the Masnavi, a mystic poem by Jellal-ud-din Rumi, of songs from Hafiz and one or two other poems, and of original pieces, some of which are rather in the style of the *Ingoldsby Legends*. We prefer to deal with Mr. Palmer as the translator only, and shall conclude the present notice with a few more extracts. One poem belongs to the seven *Moadlakat*, or prize poems suspended at the Kaaba or temple at Mecca. They were transcribed in letters of gold and engrossed on Egyptian paper—so says Sir William Jones, who translated the whole of them literally in prose. They are considered the finest poems written before the time of Mahommed. In the one selected, Antar, the Arabian hero, speaks throughout; and, beginning with love and softness, he goes on to describe the fleetness of his own camel and his prowess in battle, and ends with vengeance on his foes, "bitter as coloquintida" to the aggressor, rejoicing grimly in the retribution that overtook two men who had attacked his reputation. We add the prose version of Jones, which shows that Professor Palmer has faithfully preserved the spirit and meaning of the original. Jones says:—

I ceased not to charge the foe with the neck and breast of my horse until he was mangled in blood.

Mr. Palmer:—

I urged him forward, charging on the spears,
Till wounds had woven him a bloody vest.

The fierce termination in the two translations has an Homeric touch, and is as follows. Jones translates:—

Yes! they injured me; but I have left their father, like a victim, to be mangled by the lions of the wood and by the eagles advanced in years.

The latter phrase is somewhat awkward as applied to birds instead of men. Mr. Palmer omits the epithet:—

Well! let them threaten, but I left their sire
A feast for vultures and for beasts of prey.

The song of Hafiz, well known to Anglo-Indians, is popularly called *Taza-ba-taza*, because these words, "fresh and fresh" recur regularly at intervals. Mr. Palmer begins:—

O! minstrel sing the lay divine,
Freshly fresh and newly new,
Bring in the heart-expanding wine,
Freshly fresh and newly new—

and so on for four more verses. We recollect a version of the same song by the late John Lang, author of *The Weatherbys* and other

novels, in which this refrain was not always translated, and the effect was rather happy :—

O! minstrel sing a song to me
As fresh and new as it can be;
And let the liquid verses flow,
Taza-ba-taza, nau-ba-nau.

A translation from Anvari is cleverly done in the style of Præd; but the metre is too lively, to our thinking, for the solemnity of the subject, which deals with Lucifer, Adam, repentance and atonement, the floodgates of Noah, and the wonder-working rod of Moses. Nebuchadnezzar, in another poem, reappears as a king who consigned a Christian child to the flames, which spared the martyr and devoured the attendants. The following is striking :—

The idol in the market stands,
Wrought deftly by the graver's hands,
And visible to every eye.
Yet doth a truer idol lie
That monarch's cruel heart within,
And fashioned out of his great sin.
SELF is the name by which they call
That idol—type of idols all.

Readers who like variety will prefer the shorter of these two volumes for choice of subjects. But we have no hesitation in saying that in both Professor Palmer has made an addition to Oriental literature for which scholars should be grateful; and that, while his knowledge of Arabic is a sufficient guarantee for his mastery of the original, his English compositions are distinguished by versatility, command of language, rhythmical cadence, and, as we have remarked, by not unskilful imitations of the styles of several of our own favourite poets, living and dead.

BURTON'S SIND REVISITED.*

THE province of Sind is not exactly a lively topic for an author who aims, like Captain Burton, at being not only instructive but amusing. It is arid, sulphurous, and in its physical characteristics disagreeably allied to the Desert which is its immediate neighbour. "It is an unhappy valley, a compound of stone, sand, and silt." The sun is supposed to glow there with a fiercer ray than in almost any other part of India; its winter is boisterous and chilling; its inhabitants, the rugged children of an ungrateful soil, offer no special attraction; and its past history, if we except some fragmentary suggestions of Alexander's invasion and a few unimportant Buddhist remains, is, for all practical interests, a blank. Captain Burton, while pointing out the resemblance in many superficial particulars between Sind and Egypt, dwells emphatically on the marked distinction between the two countries as regards their monumental remains; while Egypt teems with memorials of every race that has lived and laboured or fought on her plains, while the ruins of a half-buried past confront the traveller at every turn, in Sind he will have to be content with an occasional mound, a few "Druidical" stones, and here and there a brick bearing the cross-legged image of the meditating Buddha. Why any one who has seen it once thoroughly enough to write a book about it, as Captain Burton did some twenty-five years ago, should care to "revisit" a region so little favoured by nature, history, or art, is a problem which we shall not attempt to solve by conjecture, and towards the solution of which we are constrained to admit that Captain Burton's volumes give us but slight assistance. They cannot in truth be said to be very pleasant reading, except to that curiously constituted class of mind which finds satisfaction in the mere detail of travel and the bare delineation of unfamiliar places and people. Nor is Captain Burton's narrative rendered more agreeable by the old-fashioned, barbarous pleasantry of introducing an imaginary comrade to whom the entire volume is supposed to be addressed. An author may surely say that he started for the East without disguising the fact under such dismal fun as "Stop in, Mr. John Bull"; "After you, sir"; "You sighted from afar Port Suez"; "You ask me about Jeddah and I refuse to answer, to tell a twice-told tale," &c.; and keeping up the absurd impersonation to the end of the performance, where he wishes Mr. Bull an affectionate farewell. The contrivance recalls the unhappy educational epoch when enthusiastic teachers hoped to overcome the natural aversion of youth to wholesome knowledge by dialogues in which the dates of battles and the names of queens lurked in an unsuspected phrase. It certainly, let Captain Burton be assured, never yet amused any single human being, and it gives an air of trifling and folly to his work which would make many readers throw it away in impatience. In the next book of travels which the author gives us he will, if he follows our advice, not try to be funny.

There are many subjects in the present volume which are of great interest, and deserve serious discussion, so that it is especially provoking to have them beset with unmeaning frivolities. For instance, the author considers that the present system of enlistment and invaliding in the Sepoy regiments in Sind is fatal to the efficiency of that force, and he quotes a long memorandum by Colonel Beville, C.B., commanding No. 1 Beloch Regiment, in support of this opinion, "as the opinions of so old and distinguished a soldier, published in 1873, should not be withheld from you, Mr. John Bull." Formerly, it appears that, as "Irregulars," these troops were enlisted only for five years; for good conduct in

Abyssinia they were promoted to be "Regulars," and the shorter period of service was changed to life enlistment. This system, and the accompanying pension rules, Colonel Beville considers to be a mistake, encouraging malingering, causing dissatisfaction throughout the ranks, retaining incapacitated men in the ranks, and preventing able men from enlisting. Colonel Beville's memorandum bears marks of experience, earnestness, and interest in his subject, and the system of an enlistment for ten years which he proposes to substitute is no doubt well worthy of discussion in the right place and manner. But jauntily to introduce it in a few flippant paragraphs to "Mr. Bull's" notice, and to say, as the author does, that the force is no longer what it was, and that "for this decline the authorities have only to thank their own folly," is exactly the way to postpone serious discussion, to confuse and annoy those who are anxious to get at the real merits of the case, and to add to the amount of prejudice, ignorance, and random talk with which every subject of this nature is apt to be beset.

Another and more objectionable instance of Captain Burton's trifling method is to be found in the early part of the second volume, where he discusses our position as alien rulers of populations infinitely remote from us in faith, manners, morals, and feeling. Russophobia he disposes of at once as the distorted vision of a morbid imagination. "You open the map, Rawlinson's or Gordon's. You produce and fix on your spectacles. You bend over the page and pass your finger slowly, very slowly, over the ten, over the twenty-five degrees which still separate the nearest limits of the two Empires," &c. This performance is supposed to convince "Mr. Bull" that we have nothing to fear from Russia for a century at least. Thence the author passes to internal dangers. As to these our difficulties arise, he says, from three characteristics of the subjects with whom we have to deal—"the action of their national faith, the social position of their women, and the nature of their penal code." As to the first of these he instances the case of a Mussulman Sayid insulted by a Hindu sweeper. The British rule has placed them on the same footing, but the Mussulman's pride of race and religion cannot brook the degradation of equality. "He returns home, tears his beard, dashes his turban to the ground, assembles his friends, threatens, cabals, and agitates, till he raises a tumult, which, if circumstances favour it, may end in massacre and rebellion." In connexion with this susceptibility the author objects to the rigid severity with which the British Government has punished acts of violence prompted by adultery. In Afghanistan, for instance, he thinks that "the universal discontent, excited in the breasts of the people by the conduct of the women under the new rule" must rank high among the causes of our disasters in that country. So far as British India is concerned, we believe this to be a mere delusion. In the wilder tracts, and notably on the North-West frontier, we had to deal with very savage populations, amongst whom a sort of traditional vendetta, arising chiefly out of rapes and bullock-thefts, had taken a firm root. There was much to justify a departure from the ordinary law, and the concession of something to the tastes and customs of a barbarous populace. The rulers of the country determined, however, to allow the law to take its usual course, and experience has shown, we believe, in the clearest light the wisdom of this decision. Deeds of violence, unflinchingly punished, have steadily decreased; the general population has improved in habits of order and submissiveness, and there is not the slightest reason to believe that our position in the country would have been stronger, or our hold on the population more thorough, if we had allowed any injured husband who chose to do so to exercise lynch law on the supposed objects of his displeasure. But it is against the leniency of our penal law that Captain Burton is especially vehement in his objections :—

Our punishments, too, how contemptible they must appear to the ferocious barbarians that incur them. The Affghan is detected stealing; he looks to have his right hand chopped off; we lodge him in what he considers a luxurious retreat, where he can eat, drink, smoke, and abuse the Frank in plenary animal satisfaction. He appropriates his friend's spouse; instead of perilling life or limb, he knows that these benevolent fools, his rulers, will hang the husband who harms him. Overheard blaspheming, a crime for which he would be stoned to death amid the ferocious exultation of his fellows, he now can laugh; under our rule sacrilege is not a capital offence. He commits murder, and is detected: he expects nothing but a horrible death, to be suspended by the ankles and chopped in two like a sheep hung up in your butcher's shop, or to be flayed alive, one of the most excruciating tortures that human ingenuity ever devised. He smiles when he is told that he has only to dangle for an hour at the gallows without the prospect of being left there to feed the crows, or that he is simply to be shot without the preliminary of being bustinadoed till sensation by slow degrees is expelled his form.

The author goes on to give instances in which the Eastern rulers, by various horrible punishments, cutting to pieces, impaling, blowing from cannon, &c. &c., have succeeded in enforcing their will in some particular; and he describes in detail the way in which a Turkoman village might, in his opinion, be reduced to perfect "order." The plan consists in marching on the village at night, firing it, killing all the men, and handing the women and children as a present to the soldiers. It is true that he admits that "no British officer could perpetrate such atrocities," but he considers that the British official, "hating cruelty, verges towards the other extreme, an unwise clemency, far more cruel than wise severity;" and he indicates the respects in which he would intensify the severity of the present penal law.

As to all this, we confess that we regard these hankerings after the savagery of native Governments with the utmost suspicion and dislike. There is nothing in the criminal statistics of India to sug-

* *Sind Revisited; with Notices of the Anglo-Indian Army, Railroads, Past, Present, and Future, &c.* By Richard F. Burton. London: Richard Bentley & Son. 1877.

gest that our administration of justice fails for the want of these horrible expedients. The countries where these barbarous practices still linger are precisely those where law has least force, where order is least steadily maintained, where the barbarities of the code are to a large degree reflected in the habits of the people. We hold our place in India by force not of the terror inspired by occasional acts of severity against criminals, but of patient, calm, inflexible determination to do justice according to the best of our ability. When Lord Mayo was assassinated, there were not wanting those who, in the true spirit of Captain Burton's doctrine, urged that the author of so signal a crime should be punished with some exceptional penalty, which should make his act and its doom a warning to future times. The Government of India determined, and no doubt with perfect justice, that the right course to take was to exhibit the administration of the law unmoved even by so extraordinary an event as a Viceroy's murder, and to punish the culprit as any other offender. If Captain Burton thinks otherwise, he disagrees with all that school of thoughtful and patient administrators which has brought India to its present degree of order and prosperity; and we certainly prefer the conclusions at which such men have arrived to the carelessly conceived and rashly expressed fancies of an irresponsible observer.

The preceding observations will have sufficiently indicated our opinion of the worth of Captain Burton's work. He has several of the qualifications of a good writer of travels; he is interested in and knows something about history, geology, botany, ornithology, field sports, and domestic customs. He observes much, and describes what he observes with some liveliness and vigour. But the value of his writing is seriously impaired by the strain of semi-jocular, semi-serious, offhand criticism which constantly afflicts us at an inopportune moment, and by attempts at jocosity which seem especially out of place when applied to matters as serious as the great problems of Indian administration. India is a country which suffers, we believe, from a dearth of competent critics. The work to be done is so large, the men to do it are so few, the necessity for prompt action is frequently so urgent, that many things are done which maturer counsels or stronger intelligence would have ordered otherwise. Every careful and considerate expression of opinion by an onlooker is therefore a gain; but for that very reason we deprecate the random and ill-considered observations of travellers who spend a few months in the country, hold a few casual conversations with the officials that cross their path, exchange a few remarks with such of the peasants as can talk their language, and thereupon consider themselves duly qualified to lecture the administrators of India on their shortcomings, and to enlist European opinion on one side or the other of controversies which need all the skill, care, and experience that can be brought to bear upon them.

DARWIN'S CROSS AND SELF FERTILIZATION OF PLANTS.*

THE interval which has elapsed since the publication of Mr. Darwin's *Cross and Self Fertilization of Plants* has enabled scientific opinion on either side of the Atlantic to bear witness to its value as an exhaustive investigation of one main problem in vegetable physiology. Though he has often modestly lamented that he is no botanist, it would be difficult for any professed or special student of botany to point to more thorough or more valuable work than that which Mr. Darwin has already contributed to science in his studies of the fertilization of orchids, and the habits of climbing and insectivorous plants. His latest labours in the field of botanical research testify no less strongly to his scientific activity and his sympathetic grasp of natural truth. Fifteen years ago he laid down the broad doctrine that nature abhors perpetual self-fertilization, and the interval has been spent in accumulating a mass of observations and experiments, with the result of confirming and extending that fundamental law as no less essential to vegetable than to animal life. This was the main result of a series of observations carried on for more than twenty years before that date, much of which he now acknowledges to have been set aside as superfluous by the many excellent works which have been published in the interim, especially those of Sprengel and Hermann Müller. Instead of putting forth a mass of miscellaneous facts of this kind, it seemed to Mr. Darwin better to work out one group as carefully as possible, and this he has accordingly done in the present work, which is the complement of that on the fertilization of orchids—a class of plants which he had shown to be pre-eminently constructed to favour, or rather to necessitate, cross-fertilization. To speak of them, however, as forming an exceptional case, as some observers have done, is, as he abundantly proves, an error. Without any special thought of the effects of close inter-breeding, but for the sake of determining certain points with respect to inheritance, he raised side by side two large beds of self-fertilized and crossed seedlings from the same plant of *Linaria vulgaris*. To his surprise, the crossed plants, when fully grown, showed a marked superiority in height and vigour over the self-fertilized ones. For fear of any accidental cause having led to this result, he repeated the experiment with two large beds of the carnation *Dianthus caryophyllus*, a plant which, like the *Linaria*, is almost certainly sterile if insects are ex-

cluded from it. Here too the self-fertilized seedlings came up plainly the less tall and vigorous of the two. His attention being now thoroughly aroused, he determined to make a series of experiments with various kinds, which experiments he kept up for a period of eleven years, every care being taken to exclude insects during the process of fertilization by means of nets of extreme fineness. Half the plants, carefully marked, were fertilized with their own pollen, half with pollen from a different plant, the natural sex of the crossed plants being at the same time preserved in order to render the experiments as like as possible to what goes on in nature. Some of the flowers which were crossed may indeed thus have failed to be fertilized, and have been afterwards become self-fertile; but for this and some other sources of error allowance was carefully made. The experiments were carried on through several generations, in some cases as many as ten, and the process of intercrossing was widely extended, the plan generally followed being to put into competition and to compare intercrossed plants, which were most commonly the offspring of more or less closely related plants, with the self-fertilized plants of each succeeding generation, all having been grown as far as possible under the same conditions.

Nine chapters out of the twelve into which his work is divided are devoted by Mr. Darwin to the record of the observations upon which his general conclusions are based. These observations bear striking witness to the unwearied patience and conscientious toil which characterize the true naturalist and the trustworthy discoverer. The three chapters which remain are occupied with the means of fertilization, the habits of insects in relation to the fertilization of flowers, and the general results which he is led to draw from such copious and carefully sifted stores of natural facts. The whole work may be said to form a compendium of the natural history of sexual reproduction among plants, throwing a flood of light not less novel than clear and satisfying upon many seeming anomalies in this branch of botanical science. Nothing, for instance, could well be thought more clumsy or purposeless in nature than the existence of hermaphrodite flowers side by side with the bisexual arrangement which all botanists concur in holding to be the more advanced or perfect method. It being by common consent most advantageous for an ovule to be impregnated by a pollen-grain from a different flower, and that the more widely apart the better, of what benefit is it that the stamens and pistils are found together in the same flower? Here is an apparent instance of that perpetuation of useless, or even detrimental, organs or functions which might be deemed a blot upon the beneficent wisdom of nature, and would be admitted by Mr. Darwin as fatal to his whole *rationale* of nature's procedure in the field of organic life. He is ready, as usual, with an ingenious solution of the problem. Injurious as perpetual self-fertilization undoubtedly is to plants, it is better than no fertilization at all, which would be absolutely fatal to plant life. The essential function of a flower is to produce seed, if not in one way, then in another. An alternative process is in this instance provided. Supposing cross-fertilization to be at fault, carried on as it is by the wind or insects, and liable to accidental interruption, there remains the chance, which is better than none, of the ovules of an hermaphrodite flower being self-impregnated. There are isolated cases, like that of the bee-orchid, in which self-fertilization seems the permanent and the only mode of propagating life; but further consideration is here doubtless to be applied. Whatever hesitation may still exist among botanists as to adopting diclinism as the higher form of floral development, Mr. Darwin is of opinion that hermaphroditism was the earlier of the two, even the higher animals being the descendants of hermaphrodites, such hermaphroditism having been the result of the conjugation of two individuals, their slight differences representing the two incipient sexes, and their union giving rise to that bilateral symmetry which belongs to all the higher animal organisms. In like manner he conceives the higher plants to have developed from extremely low forms, these having conjugated; the conjugating individuals differing somewhat from each other, and thus representing one the male the other the female organism. The diœcious were, according to this view, the primitive forms of plants, passing on by conjugation to the hermaphrodite, and by further differentiation not so much reverting to a diœcious type as developing a higher order of fecundation:—

Why the descendants of plants which were originally diœcious, and which therefore profited by always intercrossing with another individual, should have been converted into hermaphrodites, may perhaps be explained by the risk which they ran, especially as long as they were anemophilous, of not being always fertilised, and consequently of not leaving offspring. This latter evil, the greatest of all to any organism, would have been much lessened by their becoming hermaphrodites, though with the contingent disadvantage of frequent self-fertilisation. By what graduated steps an hermaphrodite condition was acquired we do not know. But we can see that if a lowly organised form, in which the two sexes were represented by somewhat different individuals, were to increase by budding either before or after conjugation, the two incipient sexes would be capable of appearing by buds on the same stock, as occasionally occurs with various characters at the present day. The organism would then be in a monœcious condition, and this is probably the first step towards hermaphroditism; for if very simple male and female flowers on the same stock, each consisting of a single stamen or pistil, were brought close together and surrounded by a common envelope, in nearly the same manner as with the forests of the Composite, we should have an hermaphrodite flower.

No possible interbreeding of animals, Mr. Darwin points out, can compare in closeness with the self-fertilization of hermaphrodite flowers, conjugation in the latter case taking place between cells of the same individual growing in near proximity to one another. Now there is, on the one hand, the known fact that where too

* *The Effects of Cross and Self Fertilization in the Vegetable Kingdom.* By Charles Darwin, M.A., F.R.S., &c. London: John Murray. 1876.

wide a difference between individuals in the act of union exists, whether in animals or plants, the resulting hybrid is practically unfertile; while, on the other hand, all Mr. Darwin's experiments tend to show that so close a relationship as that of self-impregnation is no less injurious to fertility. Where, then, it is to be asked, is the golden mean to be assigned? Here come in with effect our author's original and characteristic speculations on the origin of species. Formerly naturalists had been contented to say that those animals or plants were of distinct species which were in no case mutually fertile, or at least never beyond the first generation, like the ass and the horse. To question after this how far individuals of different species could be brought to interbreed was to reason in a logically vicious circle. Hence, when individuals of reputed distinct species were found mutually fertile, they were relegated to the category of varieties. To have pointed out the fallacy of such an evasion as this was the crowning distinction of Mr. Darwin's great work. No absolute definition of species has ever been found possible. What is called fixity of species is the result of the continuity of external conditions. So long as the biological conditions remain unchanged, there is no reason why a species should vary. We find deep-sea brachiopoda unvarying through long geological ages. The infusions of the now accumulating ocean-ooze are identical with those of the upheaved chalk masses. When these conditions are changed, the equilibrium is disturbed on the one side or the other. Extinction ensues, or what is called a new species is evolved. It is, then, by the importation of fresh elements of vitality in the new conditions of germination involved in crossing with a fresh stock that the benefits of cross-fertilization may be conceived to take their rise. In the process of differentiation thus set up, and continued from generation to generation, may we not see the cause of that progressive vigour, vitality, and beauty which is the fact undoubtedly established by Mr. Darwin's long train of experiments? The fertilization of one of the higher plants depends, first, upon the mutual action of the pollen-grains and the stigmatic secretion or tissues, and afterwards upon the mutual action of the contents of the pollen-grains and ovaules. Both actions, judging from the increased fertility of the parents when undercrossing, and from the increased powers of growth in the offspring, are favoured, Mr. Darwin thinks it proved, by some degree of differentiation in the elements which intermix and unite so as to form a new being. He is enabled to illustrate this fact by the analogy of chemical affinity, which comes into play only between atoms or molecules of different natures. He quotes the remark of Professor Miller that, generally speaking, the greater the difference in the properties of two bodies, the more intense is their tendency to mutual chemical action, while between bodies of a similar character the tendency is feeble. This observation accords well with the feeble effects of a plant's own pollen on the fertility of the mother plant and on the growth of the offspring, compared with the powerful influence in both ways of pollen from a plant which has been differentiated by exposure to changed conditions or by such variation as, for want of an observed cause, is termed spontaneous. The analogy, indeed, fails in face of the negative or weak effect of pollen from one species on a plant of a distinct species, nor can we wholly tell what limits of differentiation are required or laid down in nature for the fertility of vegetable unions. But neither are we led to expect the same rigorous limits in the action of living organisms which we meet with in the phenomena of chemistry, nor have we anything like the same experimental knowledge of the laws of physiological operation, especially of those concerned with the sexual elements of life. We cannot state the reason why the individuals of certain species profit greatly, and others very little, by being crossed. Why is the advantage of even a cross sometimes directed exclusively to the vegetative system, sometimes to the reproductive system, though commonly to both? Why should some individuals of the same species be sterile, whilst others are fully fertile with their own pollen? Why should a change of climate either lessen or increase the sterility of self-sterile species? And why should the individuals of some species be more fertile with pollen from a distinct species than with their own pollen? Here, as throughout the field of nature, we have many facts so obscure that we may well, with Mr. Darwin, "stand in awe before the mystery of life." Yet these facts belong to that class in which we look especially to his remarkable powers of observation and analysis for a solution of the mystery.

GARTH.

THIS, the third novel which Mr. Julian Hawthorne has published, is in many respects better written than his first two productions, but, in spite of that, it affords far less hope than they did of his ever becoming a good novelist. *Idolatry* was a work of much extravagance, in which however there were signs of original power. *Garth* is neither more nor less in its general aspect than an imitation of the older Hawthorne's method and style, while reminiscences of certain other well-known authors crop up less patently in holes and corners of the book. Whether Mr. Julian Hawthorne is or is not intimately acquainted with the works of Hans Andersen we do not know; but the first chapter of his present volumes, which he chooses to call a Bird-Prologue, certainly reminds us very forcibly

of a tale by the Danish writer called, if we remember right, "The Roses." The conceit in both instances is precisely the same; the difference is that Mr. Hawthorne's touch has not the grace and lightness of Hans Andersen's, and that he falls utterly to give to the talk of his birds the fanciful and pretty fun with which the great fairy-tale writer invested all his dialogues, whether between animals or objects of still life. The house which the swallows discuss in this opening chapter stands in New Hampshire, and is called Urnhurst; and the second chapter tells us the legend which of course is attached to it. A certain Captain Urnson, who had left the service of the Protectorate in England, came to the spot on which Urnhurst afterwards stood, and unknowingly, in taking possession of the soil, disturbed the grave of a great Indian sachem. Two Indians had watched him unobserved, and one, rushing forward, aimed an arrow at the Captain, which glanced off his helmet and wounded his wife. The Captain drew a pistol and shot him down, and to the terror expressed in his followers' faces answered, stamping down the grave which now held two bodies, "It is my deed, and thus do I trample down this blood and all superstitious terrors." Meanwhile the other Indian had fled back to his tribe, and it was supposed that through generations a blood feud was cherished by them. The experienced novel-reader will probably divine at once that the descendants of the insulted tribe and of Captain Urnson meet in the course of *Garth*, and in that he will not be mistaken. Garth Urnson, after the birds have delivered their tiresome prologue and the legend of the house has been related, is introduced to us walking about his farm in the prime of his manhood; and as soon as this introduction has taken place we are asked to go back to the day of his birth and follow the history of his childish and boyish days. This jerky style of narration has, as far as we can see, nothing to recommend it, and it has for a reader the disadvantage that when he has got through nearly three volumes he has to turn back to the first in order to identify the point at which he has arrived. Parson Graeme, a gigantic and jovial person, father-in-law to Cuthbert Urnson, Garth's father, comes in while the boy is still an infant, and delivers himself of a discourse which seems introduced for the purpose of dragging in yet another legend about the Urnson family. Ralph, son of the original Captain Urnson, had but one friend, it seems,

and him he killed in some mad quarrel or other. And for that matter the saying is, that every true Urnson will kill the man he loves best.

"Father!" exclaimed Martha, horror-stricken. "Hand me down the old pistol from above the fireplace, my dear," said Cuthbert, in a tone of quiet determination. "I will shoot both your father and Garth, for fear of making a mistake between them."

The character of Cuthbert Urnson is drawn apparently with considerable pains, and might be regarded, in spite of some absurdities, as a successful effort, if it were not obviously unoriginal. When Garth is five years old his father entrusts to his care a birch-rod, with a lecture upon its use, and an assurance that it will never be employed except at Garth's own request. Two years later the boy commits some grievous fault, and after a long struggle between himself and his conscience, gravely asks to be whipped. After this Garth develops a taste for chivalry, and rides about equipped in some of the ancient Captain Urnson's armour. As time goes on he cherishes a boyish passion for a certain Madge Danver, a kind of remote cousin of his. Madge was almost universally popular among grown-up people:—

She possessed a charming vivacity and confidence of manner, tempered by a subtle tact which enabled her to steer clear of the vulgar conceit and self-assertion of most so-called clever children. Her face was rather French in type—long and dark, with large oval eyes and vivid scarlet lips; and in her earlier years she had a tendency to the use of French idioms in her speech. For the rest, she was good-humoured, cheerful, neat, and possessed a favour and accent of her own. Her very dress, without being conspicuous, could only have been worn by herself, and she attracted a half-amused, half-pleased attention wherever she went. Such attention never disconcerted her; she was not born for seclusion, and the eye of the world had no terrors for her. There was a touch of worldly wisdom in her composition, which, as often as it came to the surface, had an indescribably piquant effect. Her voice was endowed with a certain soothing or caressing intonation, employed only upon occasion, but which might have flattered an idle or coaxed a flint. . . . If she were a coquet, coquetry was as natural to her as plain faces or slow wits are to other young ladies, and perhaps she was no more to blame for her fling than they for theirs.

One effect of Garth's feelings with regard to Madge is that for the first time in his life he consents to go to a picnic in the forest, which is Parson Graeme's annual delight, and which Garth in his peculiar shyness has hitherto avoided. He arrives at the place of meeting before any one else and climbs up into a big tree, where, for various insufficient reasons, he remains until the picnic is over, watching the attentions paid to Madge by an Indian half-breed, named Sam Kineo. Afterward Sam and Garth meet in the forest, and on Sam's boasting of the kisses he has received from Madge, Garth challenges him to fight:—

Sam fought with his strength, but Garth put the annihilation of all evil into every blow. He got more and more terribly in a rage each moment, but it was rage that calmed and cooled the faculties, not blinded them. No enemy is so unpleasant to meet as one of this kind; only killing can beat him, and if not killed, he is very apt to kill. Garth's face was fixed in a singular expression—a compound of a smile and a frown. He was bleeding from a blow on the chin. Two hundred years before an ancestor of his, on his wedding-day, had looked precisely thus.

We have extracted this passage, not because we have any special admiration of it, but because it fully supports what we have said of Mr. Julian Hawthorne's ill-judged imitation of his father's manner.

The result of the fight is that Sam Kineo gets a heavy fall,

and Garth thinks that he has killed him, and will surely be hanged, to which fate he makes up his mind, just as he did to that of the birch-rod in earlier days. Other adventures of this remarkable youth, including a dangerous descent of rapids in a canoe, to which he is goaded by Madge, we must pass over, to come to his entrance at Bowdoin College. Here, partly by dint of turning a party of aggressive Sophomores out of his rooms, he obtains considerable influence, and, becoming afterwards a friend of the leader of these Sophomores, is informed by him, in the course of a strangely unnatural, pretentious, and tiresome conversation, that he, Garth, is a genius. Certainly what we learn of him from Mr. Julian Hawthorne corresponds well enough with some popular, or once popular, idea of what a genius should be. That is, he appears to be fit for nothing, and singularly arrogant. It afterwards turns out that his genius lies in the direction of painting, for which art he has always entertained a holy horror, believing the sacred pictures of the Italian masters to be an invention of the devil. After a year and a half Garth goes back home, and is received by his father, who holds a long discussion with him on painting and other deep matters, and makes no mention of the fact that Garth's mother has just died, which he learns by chance from his grandfather. This reticence on Mr. Cuthbert Urnhurst's part is held by the author to be an act of admirable heroism, the merit of which our more limited vision is incapable of discovering. There presently arrives at Urnhurst a certain Golightly Urnhurst, a brother of Cuthbert's, accompanied by Elinor Golightly, who is his mother's grandniece. By this time Garth has got over his pious objections and taken to painting. Uncle Golightly offers him a large sum for a picture of the family legend because it contains a portrait of E'er. This picture is subsequently destroyed by Madge Danver in a fit of jealous fury. It must not be supposed that these events occur with anything like the rapidity with which we have narrated them. Mr. Julian Hawthorne has doled them out in the midst of a quantity of dull conversations between unreal people, and reflections of his own whose shallow affectation of meaning grows more and more wearisome as the book goes on. Various extraordinary things come out in the long course of the book. Sam Kineo returns mysteriously from a long sojourn abroad, and is admitted to Urnhurst by an old Indian cook called Nikomis, who happens to be his grandmother. It is supposed by her and himself that he is none other than that well-worn personage the rightful heir. To account for this the author has prepared an intricate genealogical puzzle, to which he no doubt has the clue, but of which we confess we have been unable to retain any clear impression. There is also much secret villainy on the part of Uncle Golightly, whose schemes are on the point of being unravelled by Jack Selwyn, Garth's college friend, when Madge Danver unexpectedly steps in for the purpose apparently of allowing the complication to exist so long as to fill up a third volume. The device by which she throws Selwyn off the scent is so transparent that a man of Selwyn's supposed cleverness must have seen through it. Finally, in some strange fashion things seem to be set right. Kineo, who has for long been lying concealed in the house at Urnhurst waiting his chance, is brought to see that such chance as there is is much against him, and that it would be wise to remove himself quietly. But instead of doing this, he appears in the midst of a skating party one evening, exhibits various surprising feats, and then skates off, to the great relief of Garth, who is for a time unaware that he has taken Madge Danver with him. When he finds this out, he skates after them, and catches them up, in spite of their start:—

Onward still he swept, and the pace must have quickened, for that spirit of the old Puritan was now outtipped! Blessed were the barren miles of ice that had hindered his revenge! Nor were they barren, since they had brought forth this fair fruit in him. He loosened the hatchet from his belt, and swinging it from right to left, sent it thence whizzing and spinning far across the glassy surface. "I'll get her, if God pleases," he said aloud; "let the devil's part go!" But Providence knows many ways of saving; and that which seems the speediest is not always so, where wayward human souls are concerned.

Nearly an hour had now gone by, and the moon, looking down through a cloud-rift upon the long-drawn icy surface, marked the shadows of three human figures hastening along it, two in advance and one pursuing: and the space between pursuers and pursued grew constantly less and less. At length the latter, being within about four hundred yards of the old wooden bridge, came to a standstill. The buckle of the man's skate-strap had given way, and he knelt to repair it. The woman, after restlessly watching him for a while, threw herself down on the ice near by, and gazed back toward the place whence she came. Suddenly she crouched low and laid her ear against the surface; then leapt to her feet with a low exclamation. She had heard the ring of steel, approaching fast. The man, too, arose with a curse, holding one skate in his hand.

We then get a second reproduction (as if one were not more than enough) of the family legend in the struggle between the two men, and Kineo, in consequence of Garth's generosity, goes on his way, followed secretly by Madge. Cuthbert Urnhurst is immediately afterwards accidentally killed by his brother. In after years Garth marries Elinor; they return to Urnhurst in time to see it burnt down, and the novel is finished, as it is begun, by a bird-dialogue. The book is completely unsatisfactory, and consists of a tedious working out of a conceit of the kind which the elder Hawthorne might have turned into a delicious short story, but which the younger evidently could not handle with success even within far narrower limits than those of *Garth*.

THROUGH NORWAY WITH LADIES.*

AFTER an interval of twenty years Mr. Williams has written a sequel to a former book of his, *Through Norway with a Knapsack*; but in the work that has now appeared he has broken different ground. Twenty years ago, as he tells us in his preface, he gave the experiences of a hardy pioneer in the rough, who has since been followed by increasing numbers of his countrymen. On this occasion he travelled with a party of half a dozen schoolgirls, in such comfort or luxury as the circumstances admitted. Perhaps this second journey was even more of a success than the former, since he can boast that it was accomplished without the slightest accident, although the young ladies themselves drove the carriages over the mountain roads, "and up and down some hills that a professional English coachman would refuse to attempt." This immunity from mishap was perhaps not so very wonderful. A clever Norwegian pony will drive himself, and puzzle his driver to throw him down. The natives seem to have been most chivalrously courteous to the travellers, always providing the best animals available, and often sending experienced men in charge instead of the ordinary girls and boys. At any rate it is certain that Mr. Williams and his young charges found that they could get along exceedingly pleasantly. Prepared to take the rough with the smooth, they seldom found much to complain of in the accommodation; and their worst embarrassments were caused by their number, which involved considerable telegraphing in advance, while it occasionally led to inconvenient crowding at the posting stations as well as on board the coasting steamers. Since Mr. Williams's knapsack journey the cost of travelling in Norway has materially increased. But even now, relatively speaking, it is exceedingly moderate, and moreover the fare and the quarters have improved more than proportionately. Norwegian posting-masters and innkeepers are a very independent race; but it is rarely that they will not do their best if you approach them in the right way; and they are almost invariably inclined to be gallant to the fair sex. The daily expenses of each member of Mr. Williams's party averaged only nine shillings even in the hotels in the larger towns; and we can only wish that innkeepers elsewhere were to regulate their charges by the Norwegian wine-lists. We might distrust the vintages of Château Lafitte or Romanée at six shillings and eightpence, but it is something as times go to get sound claret at two shillings and ninepence, when one considers the distance between Bordeaux and Scandinavia. The ordinary dinner charge on board the steamboats is less than half-a-crown, and that includes soup, fish, and two dishes of meat, with a most luxurious dessert and a variety of piquant *hors d'œuvre*.

Tourists who may provide themselves with his book will find Mr. Williams an entertaining and instructive guide. But he has very decided opinions and prepossessions, as well as relays of pet hobby-horses which he is in the habit of riding indefatigably. His observations on glacier-motion are interesting and valuable; but he is too ready to bore you with them, in season and out of season. And then the range of his remarks is decidedly rambling and desultory. Any chance incident serves for the text of a tirade on some social question, where he is pretty sure to be at issue with the great majority of his fellow-mortals, and which he disposes of out of hand with a pleasant assumption of infallibility. The reader, however, must have a decided advantage over the chance travelling acquaintances with whom the author may have discoursed in Norway, as he can skip at his discretion when digressions bore him. And Mr. Williams writes agreeably and describes graphically, while the route he followed was a very comprehensive one, considering that his party consisted of ladies. They coasted to the northward, past the North Cape to the weather-beaten shores of the Varanger Fiord; then, landing at Trondhjem on their return, they pushed to the south across the Dovrefield to the valley of the Romsdal Fiord, whence, taking a fresh departure, they described a picturesque détour travelling inland through the mountains to the capital. At one time or another they had opportunities of repeatedly admiring every variety of scenery, and, we may add, of experiencing every vicissitude of weather. In point of climate, indeed, they were far from fortunate, since they were informed by old residents in the country that it was the worst summer that had been known for many years. And nowhere perhaps are you more dependent on favourable weather for a successful tour. It is not only the intense unpleasantness of wet and cold, though that is much; but, when the mists from the uplands meet the fogs from the sea, you miss all the magnificent effects of the mountains and precipices that lock in the winding arms of the sea. There is no waiting patiently for better luck, for the steamer will move onwards with you whether you like it or not; and it is quite possible to reach the latitude of the North Cape without having had more than glimpses of the country. Happily, this was not the fate of Mr. Williams and his young charges. They could enjoy the rugged contours of the Lofoden Isles, though the steamer, hurrying on its course, paid the group but a flying visit. Mr. Williams recommends, by the way, that those who have leisure, and are indifferent to roughing it, should make a closer inspection of those remarkable islands by taking a passage on board one of the small packets that ply among them. You would have to put up with cramped accommodation, primitive cookery, and objectionable smells; but at least you would be safe from the sorrows of sea-sickness, since almost all the channels in the archipelago are protected by natural breakwaters.

* *Through Norway with Ladies*. By W. Mattien Williams, F.R.A.S., Author of "*Through Norway with a Knapsack*," &c. London: E. Stanford 1877.

The party reached Tromsø in time to see the midnight sun, which is visible for the last time over the horizon on the 21st-22nd of July. It is on the 22nd of January that the sun makes his appearance for the season there after an absence of a couple of months, and then the inhabitants celebrate the turn of the year with salvoes of guns and extraordinary festivity. From Tromsø they steamed to the north between the mainland and the rugged islands that fringe it, "undistinguishable one from the other as we pass them, but wild and grand on all sides." Tromsø had grown in importance since Mr. Williams visited it twenty years before, but it appeared to have been thriving at the expense of Hammerfest. The latter town showed fewer signs of life than formerly, and there was less commercial activity in the harbour. Nothing struck the travellers more than the countless swarms of sea-fowl that breed on the almost inaccessible ledges of the North Cape and the neighbouring headlands. The face of the Fugleberg, which is even grander than the more famous promontory, is "a gigantic structure rising from the sea to the summit," and grooved in a succession of narrow shelves. Many of them are more than a mile in length, and they are separated from each other by intervals of only two or three feet. Along these shelves the sea-birds seem to "dress" themselves by the hundred thousand, squatting about eight or ten inches apart. "They appear like an audience of a million or two of pignies in evening dress—all shirt-front—occupying accurately measured seats, all numbered and strictly reserved." At the sound of the steam-whistle they rose in clouds, the rush of their innumerable wings mingled with their shrill, wailing cries. The codfish are more abundant in the seas than the sea-fowl upon the cliffs. Whenever the vessel touched at one of the lonely little settlements, the lines were thrown overboard and the fish hauled in fast. The codfishing is being carried on more systematically and with steadily increasing profits. At present about 50,000,000 cod are exported annually by the Norwegians, besides those that are captured by foreign craft or kept for consumption at home. There comes annually a fleet of vessels from the French ports, with many Russians besides. At Vadsø the visitors were struck by the curious spectacle of spaces of many acres around the little town, covered with low wooden scaffoldings hung thickly with the fish in course of drying—a sight which from a distance suggested to Mr. Williams those trellised vines which are the glory of Italian landscapes. But this lucrative industry has its drawbacks. The whole place is redolent of cod, and the fragrance of the fish in course of curing is overpowered by the odours from the caldrons where the livors are being converted into oil. Fish guano, too, is another staple production; and latterly an enterprising native has carried out with excellent results a novel method of catching whales. The ladies were lucky enough to see a huge carcass in the act of being broken up; a group of bloodstained men were working up to their armpits among the flesh and blubber; the water of the little cove was reddened with gory streams; and the stench was even more overpowering than anything they had as yet experienced. We have an amusing account of the visit they paid on the return journey to the standing Lapp encampment in the neighbourhood of Tromsø. They had arranged to have the reindeer herd driven in for their inspection, and were a good deal disenchanted in many respects as to preconceived impressions. The deer were small and rough in the hide, and anything but remarkable for docility. Each of the females had to be lassoed and secured before being milked in a series of struggles.

After the somewhat cramped accommodation of the steamers, carriage travelling came in as an agreeable change. Being then in the height of the tourist season, the party wisely made comparatively short stages so as to increase the chances of finding accommodation. Many of the stations were excellent, some poor; but the former decidedly predominated. Things no doubt are apt to change from year to year; but the station of Sande was so exceptionally good that it is worth while calling attention to it. The travellers were tempted to remain there for several days, luxuriating not only on the fruit, pastry, and cream which must have recommended themselves especially to the tastes of the young ladies, but on fish and game and mountain beef and mutton. The currant-bushes in the garden were phenomenal; the boughs were bending to the ground under the weight of their luscious bunches, and the yield of the cherry-orchards was marvellous. The vale of Sande is surrounded at no great distance by magnificent mountain scenery; the "water-falls and torrents are too numerous to specify or bear separate names," so that other tourists might do worse than follow Mr. Williams's example in reposing from their fatigues by breaking their journey there. Besides hints of this sort which we gather incidentally from the general narrative, Mr. Williams gives a good deal of systematic practical information in his appendix, which may be useful as a guide for the present season. So that we may unhesitatingly recommend his book, though his readers must be prepared to put up with certain peculiarities of opinion.

FRENCH WORKS ON GEOGRAPHY.*

THE complaints once made about the ignorance of our French neighbours in matters connected with geographical

* *Nouvelle géographie universelle*. Par E. Reclus. Vol. I. L'Europe méridionale. Vol. II. La France.

Géographie historique et administrative de la Gaule romaine. Par E. Lejard. Vol. I.

Nouveau dictionnaire de géographie universelle. Par M. Vivien de Saint-Martin. Livr. I.

Histoire de la formation territoriale des états de l'Europe centrale. Par A. Himly. 2 vols. 8vo.

science must have referred to the system of teaching rather than to the lack of qualified teachers; for it seems difficult to believe that volumes such as those now before us should be the result of the Franco-German War. MM. Reclus, Desjardins, and Vivien de Saint-Martin had begun accumulating materials for their respective works long before a conflict between France and Germany was anticipated, and we refuse to look upon them in the light of penitent sinners who have been brought to see the error of their ways. We take up first the magnificent *Géographie universelle* for which we are indebted to M. Elisée Reclus. When the fourteen or fifteen instalments of which it is to consist are published, it will be certainly one of the most exhaustive treatises of the kind ever issued either in France or elsewhere. The author starts from the eastern coast of the Mediterranean; he conducts us through Greece, Turkey, Roumania, Italy, Spain, and Portugal, landing us, at the beginning of his second volume, on the shores of his native country. A general survey of the whole subject introduces most naturally details respecting the various provinces. What is the physical constitution of the soil? How has it been affected by meteorological and other causes? What races have successively inhabited the land, all more or less helping to mould the people such as we find them at present? Such are the questions discussed by M. Reclus in his preliminary chapters, and under his pen the matter-of-fact details of geology and hydrography become lifelike and almost fascinating. M. Michelet, in the second volume of his *History of France*, set the example of illustrating the intellectual and moral tendencies of the several French districts by the configuration of the territory, the peculiarities of the climate, and the consequent productions of the soil. M. Reclus takes up the same idea, but he does so more scientifically than the celebrated Professor; and his remarks, coupled with the map of prehistoric France drawn by M. de Mortillet, will be found extremely valuable. The origin of the Iberi, the Celts, and the Kymri is a question respecting which M. Reclus differs from many writers on ethnology. He quotes Onalius d'Halloy, who denied entirely the supposed emigration of the primitive inhabitants of Gaul from the plateau of Central Asia; and, according to him, M. Pictet's map of the Aryan colonization has no other value than that of being a *pièce justificative* in the prevailing mania of tracing back everything to Asiatic sources. After these preliminaries, M. Reclus takes us to the region of the Pyrenees, and, gradually working his way in an easterly direction, he studies the Jura district, the central provinces, Brittany, Normandy, and finally the Northern departments. The large scale on which the work is planned enables him to vary his statistical details by excursions into the domains of archaeology and history; besides which a special chapter is devoted to an account of the government and administration. This is a part where many of M. Reclus's readers would probably think that his political sympathies have led him to unsound conclusions; but the case is just the reverse, and we look upon the fourteenth and fifteenth chapters of the volume as by far the best.

With M. Ernest Desjardins geography is treated as the handmaid of history, and the data it supplies are brought in to illustrate questions of government and of religious, social, and political organization. As the author observes in his preface, the geography of the Roman Empire had until recently been merely limited to a scientific discussion about the position of localities which have long since disappeared, and their identification with modern places. Valois, d'Auvillo, Gosselin, even Walckenaer, did not venture any further, for the simple reason that they lacked the means of information we now possess, and that as recently as half a century ago certain aspects of antiquarian research were completely unknown. At the time when Dom Bouquet and his fellow-Benedictines published the first volume of the *Recueil des historiens*, the texts of the classical writers of Greece and Rome were the only available sources for an acquaintance with the geography of the Empire; a few monuments had, it is true, been studied, but very imperfectly, and the inscriptions collected by Gruter, Muratori, Maffei, and a few other scholars were neither accurately transcribed in some cases nor correctly interpreted. It is not too much to say that the conditions of historical geography are now completely changed. We should be the last to deny the merits of the illustrious archaeologists whom we have just mentioned; but if we study the works of Borghesi, MM. Renier, Mommsen, Henzen, and De Rossi, we see at once what improvements have taken place during the last half-century even in the field of epigraphy. Numismatics come next; the contemporaries of Dom Bouquet had at their disposal a very limited number of coins, compared with the extensive collections of the present day, and those belonging to the Merovingian period or of strictly Gallic origin were remarkably scarce. Diplomatics should not be forgotten; the charters and other official documents of the middle ages supply a vast amount of information on the period of transition between the Roman régime and the Teutonic. Finally, there are the discoveries made in the very soil of Gaul, which are almost daily adding to the store of information we already possess.

We cannot here attempt to follow M. Desjardins through the development he gives to the ideas we have only summarized; enough has been said to prove the opportuneness of the present publication, and the reader must judge for himself how far the plan which the author has sketched is carried out. What this plan is we shall now state as briefly as possible. Like M. Fustel de Coulanges, his colleague at the Institute, M. Desjardins is a decided *Romantist*, and he takes, in his view of modern history, a line of thought diametrically opposed to that

adopted by MM. Amédée and Augustin Thierry, Henri Martin, and Guizot. According to him, we must unlearn as fast as possible all that we have been accustomed to hear in the school and lecture-room on the despotism of the Imperial system and the mal-administration of the Cæsars; as a matter of fact, he says, the Emperor delivered the provinces from the tyranny of the proconsuls, and Gaul, in particular, enjoyed during the three centuries following the downfall of Republican institutions an amount of prosperity which it would be absurd to deny. If so many erroneous views have been circulated as to the nature and character of the Imperial Government, it is mainly owing to the fact that students have drawn from documents referring to a certain period conclusions as to an entirely different period. What should we say if we heard of some historian applying to the administration of Louis XIV. a text borrowed from the Code Napoléon or the principles of legislation in use at the present time? The facts brought to light by the progress of numismatics and epigraphy will fortunately assist in dispelling all these errors, and placing in its true light the state of Gaul considered as a province of the Roman Empire.

The work of M. Desjardins is intended to form three volumes, the present one being a kind of geographical introduction. He takes in succession the orography, the hydrography, the description of the sea-board, the climate, and the natural productions of each district; and the excellent coloured maps with which the book is illustrated enable us to form an accurate idea of the revolutions which have taken place in several localities in consequence either of the steady inroads made by the sea, or, on the other hand, through the gradual accumulation of sand, earth, shells, &c. It is evident that, for want of understanding these physical changes, it would be impossible to explain a large number of apparent geographical puzzles which we find in the narratives of classical historians and mediæval annalists. Thus the changes which have occurred in the estuaries of the Rhône, the identification of *Bononia* and *Itius portus* on the Northern coast, and the determination of the part of Armorica inhabited by the Veneti, are topics requiring to be cleared up as completely as possible. M. Desjardins is not satisfied with merely referring to his authorities; he quotes the principal passages, transcribes epigraphic monuments, and borrows from old geographical lists indications which he compares with the terminology of classical writers. Thus, to quote his concluding remarks, the volume we have been noticing gives us, so to say, the scene of the events to be afterwards related; and our acquaintance with the soil of Gaul, its productions, configuration, and climate will enable us the better to understand the policy followed by the masters of the world in the government of the vast dependency which extended from the Rhine to the Pyrenees.

M. Vivien de Saint-Martin is another writer who has done much for the improvement of geographical science. Without mentioning his *Année géographique*, decidedly the best of the series of year-books published by Messrs. Hachette, let us say a few words about his new *Dictionnaire de géographie universelle*, the first two parts of which have recently appeared. Published in quarto shape, printed in three columns in very small type, each *livraison* contains an amount of information which is perfectly wonderful, and which makes the work not only a gazetteer, but a bibliographical dictionary, a philological treatise, and a repertory of history both ancient and modern. The very first word, the substantive *aa*, for instance, gives the author an opportunity of discussing a point of etymology. In Holland, in Sweden, in Switzerland, *aa* means a river; it is the old Teutonic *aha* and *au*, corresponding to the Gothic *aha*, the Anglo-Saxon *ea*, the Gaelic *abb*. Through the modern Persian *ab*, it can be traced back to the Sanscrit *ap*, *apa*, *avaya*. The Greeks, as we can see in Hesychius, designated an assemblage of waters by the word *aa*. The article Afghanistan is completed by a bibliographical list extending over a column, which gives the most recent authorities in the various European languages. The one on Africa contains a very interesting description of the maps of that continent drawn since the well-known chart of Fra Mauro, drawn between the years 1457 and 1459, in one of the rooms of the library belonging to the Camaldole Monastery at Venice. The *Agau* or *Agauas* of Abyssinia, described by Bruce and M. d'Abbadie, are interesting from the philological as well as the ethnological point of view; the French traveller had noticed that their vocabulary comprised a certain number of words having great affinity with terms expressing the same ideas or objects in the European languages. Further studies have tended to generalize this fact, and to show that at some period there must have been a direct and decided influence exercised by these languages on the idiom of the Agauas.

M. de Saint-Martin's Dictionary has for its natural adjunct an atlas drawn under the superintendence of M. Etienne Colin with almost artistic perfection. The maps of which this atlas consists form three distinct divisions, the most important of which reproduces the geographical and political features of the several countries such as they exist now. With the exception of Turkey, all European States boast of their topographical maps taken from trustworthy and faithful survey; the task of the French draughtsman was limited accordingly on this occasion to the reduction of the original designs, bringing out as clearly as possible all the physical details. In other cases M. de Saint-Martin had at his disposal only the narratives of travellers, local maps, and, in a few instances, some national documents. The labour was then of a more difficult character; our author had to compare and

to combine these various sources of information, selecting what were of chief importance, and endeavouring, amongst sometimes conflicting views, to distinguish the most authentic.

Historical geography could not be neglected, and although d'Anville in this speciality did excellent work a century and a half ago, yet we need scarcely say that the whole subject has since then been completely revolutionized. M. Desjardins brings out this point very strongly in the volume we have already noticed; and the necessity of keeping historical geography *au courant* of the present state of the civilized world has suggested to M. Himly a most valuable work, the first two volumes of which were published a few months ago. The author deals with central Europe, and traces the various political transformations through which Germany, Switzerland, Belgium, and Holland have passed since the earliest times. Physical peculiarities, such as the course of rivers and the direction followed by mountain systems, are not always taken in these days as a guide by diplomatists in the determination of frontiers and the grouping together of provinces; but still they were the original boundaries fixed by nature, and at any rate it is important to show what are the resources available in the different political divisions of Europe, and how far the configuration of the soil can account for the vicissitudes of war and the combinations of statesmen. Like M. Reclus and M. Ernest Desjardins, M. Himly has therefore bestowed special attention upon physical geography; the whole of the first book is taken up by it, and many readers will no doubt regard it as the best part of the work. We cannot attempt to follow the learned author through his description of the rise and development of the German Empire, from its humble commencement in the Roman epoch to the establishment of the Confederation. History here becomes very puzzling, and it requires all the learning of a scholar such as M. Himly to thread his way through the intricacies of the mediæval epoch, with its petty rivalries of dukes and counts, margraves and princes. The history of the Austrian monarchy comes next. M. Himly traces it back to its origin, and brings it down to our own times, when Prussia takes its place, and endeavours to realize that ideal of a united Germany which had hitherto seemed impossible. The temptation to introduce in this part of the work allusions to the politics of the day was a very strong one, but M. Himly has resolutely kept within due limits, and he leaves facts to speak for themselves. In the fifth book we are introduced to the vicissitudes of the smaller German States; Switzerland comes next under consideration, and the volume ends with the history of the Netherlands. We see at once what the author's plan is; he considers history from its practical side; he tells us how a war, a treaty, a matrimonial alliance has modified the frontiers of this or that State; he illustrates the map of Europe as it stands now, comments upon it, and discusses the great ethnographical, topographical, and statistical facts which have gradually led to the present arrangement of political communities and to the distribution of power. We may safely say, in conclusion, that the works of MM. Reclus, Desjardins, Vivien de Saint-Martin, and Himly are a sufficient answer to the critics who are still disposed to call in question our neighbours' proficiency in geographical knowledge.

DIAMONDS.*

IN the year 1694 it was discovered by actual experiment at Florence that a diamond would burn. Cosmo III. had one fixed in the focus of a burning-glass, and, after some exposure to the rays of the sun, it cracked, coruscated, and finally disappeared like a ghost, leaving no traces behind. Experiments of this kind were costly. They were long in yielding any scientific results. It was only a sovereign prince who could afford to see his jewels vanish like the gifts of a fairy godmother. Another potentate, the Emperor Francis I., tried a number of valuable diamonds in the heat of a smelting-furnace, and may have felt some gratification in finding they had disappeared. This was in 1750, and about twenty years later a magnificent diamond was burnt in France. A jeweller named Le Blanc denied the possibility of burning diamonds, and suspected some unfair play on the part of Macquer, the chemist who conducted the operation. He had often, he asserted, exposed diamonds to great heat with the sole result of increasing their brilliancy. Mr. Streeter has done the same with success. But Le Blanc only knew half of what Mr. Streeter knows, and when the chemists demanded that he should enclose some diamonds in coal in a crucible, he rashly assented, and in three hours they had all disappeared. Then another jeweller, Maillard, by name, who seems to have had a suspicion of the scientific truth, put three diamonds into an earthen pipe bowl, packed in powdered charcoal, and exposed them without injury to intense heat. Lavoisier, who was present, proved in 1776 that by shutting out the air the diamond was preserved in a furnace, but that the admission of oxygen, with which the carbon combines, allows the diamond to burn like a piece of coal. Sir Humphry Davy succeeded in proving that the diamond contains no hydrogen; "and," adds Mr. Streeter, "it is almost unnecessary to say that the gas formed from the combustion of Diamonds is carbon-dioxide (carbonic acid Co²), the gas yielded by every fire and gas-burner, and by the combustion of our own bodies; these latter, in the combustion that attends their very living, evolve carbon-dioxide by the lungs, so that the old fable of the maiden

* *Precious Stones and Gems*. By E. W. Streeter. London: Chapman & Hall. 1877.

from whose lips fell Diamonds may have a really scientific basis after all." This is very pretty, no doubt. But the coalheaver exhales CO^2 as well as the maiden in the fairy tale; and the carbon-dioxide evolved by the London Gas Companies is not of a quality to suggest diamonds, or indeed anything of unusual brilliancy. People who do not find gas sufficiently expensive may learn in Mr. Streeter's pages how to burn diamonds, and can take their choice of two or three methods. As there seems always to be some uncertainty as to the result, a little refreshing excitement might be connected with these experiments, and while they would not cost more than horse-racing, they would generally leave as little behind by way of profit. A burning diamond must be well worth seeing. Guyton de Morveau consumed one in oxygen gas under a burning-glass:—

First he saw on that corner of the Diamond which was in the exact focus of the lens a black point, then the Diamond became black and carbonized. A moment after he saw clearly a bright spark twinkling, as it were, on the dark ground; and when the light was intercepted the Diamond was red (red-hot) and transparent. A cloud now passed over the sun, and the Diamond was more beautifully white than at first; but as the sun again shone forth in its full strength, the surface assumed a metallic lustre. Up to this point the Diamond had sensibly decreased in bulk.

The half-burnt gem was then reprieved for a day or two, but on the resumption of the process disappeared. Fourcroy was able to make a black mark on paper with diamond soot, and there seems to be no doubt that incrusting "black carbon" may be produced in sufficient quantities to be seen, while the dark marks on some diamonds may be removed by intense heat, applied with care, so as not to complete the act of combustion.

How the diamond comes into existence is perhaps a more interesting question than how it may be destroyed. Acids have no effect upon it, so that it may be argued acids did not make it. But most of the answers to the question only remove it a degree further back, and men seem as unable as ever to produce diamonds artificially. To say that they consist of sublimated charcoal is like saying that a net consists of a "series of reticulations." Newton gave it a vegetable origin, Parrot made it volcanic, Goebel electric, and Liebig ascribed it altogether to a process of decomposition, adding "What kind of vegetable substance, rich in hydrocarbons, was that the decomposition of which gave rise to the diamond, and what particular conditions had to be fulfilled in order to crystallize the carbon, are not at present known to us." Mr. Streeter, however, inclines to a different view from any of these. Many puzzling appearances can be explained only on Simmler's theory, which is that the diamond "is the result of the crystallization of carbon from a liquid solution." Carbonic acid in a liquid form may have collected in remote cavities under tremendous pressure, and where it found some pre-existing form of carbon, perhaps coal or another vegetable substance; a sudden abatement of the pressure would account for the existence of the pure carbon sometimes found, while the crystallization of the solution, by the evaporation of the fluid, would sometimes take place instead. By some such theory may be explained the rough rind of the native diamond, the occasional presence of pieces of quartz enclosed, the peculiar form of a white stone from which a yellow one appears to grow, and the finding, by Tavernier, in the cavity of a large diamond, of some black carbonaceous matter which was pronounced to be vegetable mud. As to the possibility of making diamonds Mr. Streeter does not give us much information, though he by no means denies it; but, if carbon is to be crystallized, the process would probably be so long, so difficult, and so seldom successful, that the artificial would cost as much as the natural stones. Crystals of boron have many of the properties of the diamond, but can be made only very small in size, and of no commercial value.

It is not very easy to make out which is the largest diamond now in existence. Mr. Streeter mentions two as entitled to the honour—the Braganza, in the crown of Portugal, and one which belongs to the Rajah of Mattan in Borneo. The Portuguese jewel is of doubtful quality. It weighs 1,680 carats, and is the size of a hen's egg, but is believed to be only a white topaz. The Portuguese Government withhold any information on the subject, but if it is genuine it is worth nearly sixty millions sterling, unless Mr. Streeter's printers have made a great mistake. The Borneo gem was found on the island about 120 years ago, and weighs 367 carats. A governor of Batavia is said to have offered 150,000 dollars and two men-of-war for it without success, and though many battles have been fought over it, the Rajah regards it as a talisman, and it is still in possession of the same family. The Orloff diamond in the Russian Imperial sceptre weighs 194½ carats; Catherine II. gave 90,000*l.* for it, and pensioned the merchant who brought it to her at 4,000*l.* a year. It is not out to advantage, and another among the Russian crown jewels, which weighs 86 carats, is but partly cut. It is easy to understand a reluctance to have diamonds cut. The advantages of cutting are not always very plain, while the enormous diminution of weight which commonly ensues affects the public estimation more than the increase of brilliancy. The famous diamond which the Regent Orleans bought from Governor Pitt for 135,000*l.* formerly weighed 410 carats; but was reduced by cutting to 136½. The Duke of Westminster has one which was reduced by cutting from 89 to 28 carats. But the most prominent example of the kind is afforded by the recent history of the Koh-i-noor, which weighed 186 carats when it arrived in this country, and lost 80 by cutting in 1851. Why it was cut at all nobody seems very well able to say, and competent judges deny that its brilliancy has been increased to such an extent as to make up for the loss. Sir David Brewster warned

Prince Albert of the impossibility of improving the lustre without serious diminution of weight; but a foreign diamond merchant thought differently, and, as is usual in England, any opinion on matters of the kind is taken before that of a native. The vulgarity of taste which only admires regularity has deprived the world of many great diamonds, and we shall probably have to wait long before it is universally acknowledged that symmetry is not absolutely necessary to beauty. The ancient regalia of the Visigothic kings in the Hôtel Cluny, the so-called sword of Charlemagne in the Louvre, the ruby in the English crown at the Tower, are not less beautiful because they look a little rough. The great jewel wearers and collectors, the rajahs of India, seldom have their diamonds cut into regular forms, and the Koh-i-noor was no exception. Its history may be traced for nearly two thousand years, and it seems that at some remote period it weighed 793½ carats; but that Shah Jehan had it cut by a Venetian in his service, who contrived to reduce it to the 186 which it weighed when it reached this country.

The most valuable part of Mr. Streeter's book is that which relates to the diamond-producing countries. It seems that about the beginning of 1867 the first stones were found in South Africa, one which weighed upwards of 21 carats having been exhibited in that year at the Paris Exhibition. At present, Mr. Streeter considers South Africa the chief diamond field of the world, and in 1870 he sent out an expedition under Mr. Tobin to explore on the spot. He is of opinion that the crystals were "originally developed in an igneous matrix, belonging probably to that large series of eruptive rocks which have burst forth through the Karoo strata at so many points in South Africa." By denudation the gems have been carried all over the country. Among the largest South African diamonds yet found one weighed rough 83½ carats, and was reduced in cutting to 46½; another weighed, when cut, 60 carats; but the largest of all is the famous "Stewart," which weighed in its rough state nearly two ounces, and of which Mr. Streeter gives a picture. Twenty per cent. of the African diamonds are of the first water, and already the Brazilian mines are beginning to suffer. When the South American colonies first sent diamonds to Europe, the Indian merchants were frightened at the prospect of competition, and the stones used to be sent from Brazil to Goa, and thence home to Portugal as Indian diamonds. Very few large stones have been found. The largest weighed 254 carats before cutting; but in ten thousand specimens it is rare that more than a single stone weighs 20 carats. In all the Brazilian works, two whole years only produced one diamond over 30 carats. The Indian fields appear to be exhausted—in comparison, that is, with those of South Africa; but it may be said of all that scientific knowledge has totally altered the conditions under which the search has been carried on. Mr. Streeter, for instance, prophesies that a diamond-field will be discovered in Queensland, and that the New England district of New South Wales will sooner or later be found to yield stones of paying quality. About sixty have already been found in the gold-fields of Victoria; but few of them have been of good colour or large size. It is difficult for people who have no property in those parts to feel any great interest in the question; a point of far greater importance to mankind being that which relates to the use of "carbonado" for rock-boring. "Carbonado" is pure carbon, and was first used in cutting diamonds, being of extreme hardness. But of late years it has been found so useful in boring that its price has risen from one shilling to eighteen a carat. The stones are fixed in a ring of steel—Mr. Streeter says an "amular ring"—and are pressed down into the rock, while the crown is made to revolve several hundred times in the minute. So hard is the carbonado that a mile of granite can be bored through before the stones are seriously worn.

SEACLIFFE.*

THE author of *Seaclyffe*, in a dedicatory epistle, says that he will be grateful if the Very Rev. John Caird, Principal of the University of Glasgow, does not discover in the work "any instances of violent improbability, glaring anachronism, or culpable ignorance." We do not pretend to any peculiarly intimate knowledge of the period—that of James I.—in which the story of *Seaclyffe* is cast. But, after reading the novel, we do seem to have encountered incidents and characters of a rather unusual and even startling sort. There is so much writing in *Seaclyffe* of a kind which is new to us that we propose to lay a sketch of the plot before our readers, who will then be able to judge for themselves as to the Rev. Dr. Caird's chance of discovering in the work examples of violent improbability or glaring anachronism.

At a period in his glorious reign when James was divided between his fondness for "Steenie" and his affection for Carr, one of the rulers of the Jewish Synagogue in London appeared before the monarch with a petition. We had not been aware that a Jewish Synagogue was tolerated in the time of the British Solomon; but that is a matter of detail. Ezekiel, the petitioner, was got up in phylacteries and other vestments, regardless of expense and of the feelings of a Christian crowd, who seized him when he left the presence, and bore him off to a place near the palace, "where the embers of a fire that had only that morning been employed to burn a heretic were slowly smouldering in the ashes." Ezekiel was rescued by the guard, but vowed "to cut off him that had done this evil" and insult to a ruler of the great congregation. Now in the crowd was a man called Seaclyffe, whose

* *Seaclyffe*. (First Issue.) 3 vols. London: Provost & Co. 1877.

was assisted by his accomplices, and when Ezekiel offered a reward for the detection of his persecutor, it struck Peregrine Potts, a discarded secretary of the Scotch Earl of Seaclyffe, that he might as well denounce that nobleman, and win the reward, with the money he would publish his epic poem, and secure immortality. Potts, who was very poor, and therefore wore "a richly-lowered damask morning-gown," found Ezekiel in rather a bad temper. "He was about to give orders to one of his servants to take Potts down to one of the vaults," when he thought better of it, and listened to his evidence. The poet had forged a letter, in which the malignant Earl addressed him thus:—"Believe me, dear Mr. Potts, yours truly, Seaclyffe," a sentence in which every one will recognize the epistolary style of the period. Meanwhile, the Earl, who had just returned from Egypt to his castle, was awaiting in a great fright his marriage morn. Dinner, which was shared by his cousin, Henry Aubrey, and by Mustapha Effendi, a native of Persia, and one of the many magicians of the story, "took place in a large, arched apartment." "The Earl was unusually dejected," and "was depressed in the extreme." Henry Aubrey only bored him when he "spoke of the pleasures of the Angle or the Chase." "He was lost in reverie, and suddenly springing from his seat exclaimed, 'I see it; it is only, however, what I expected.' 'See what?' inquired Mustapha. 'The Spectre with the Bloody Hand,' replied the Earl. 'It is the evil omen of our house, and has appeared regularly at a marriage fit at least three generations.'"

The spectre kept going out at 11 in, and then the servant brought in the letter-bag. Seaclyffe's betrothed "wrote a hurried line, to say she was well," but had been frightened by an owl. Then there was a threatening letter from Ezekiel, beginning "Nazarone," and another of an extortionate character, from Potts. Thus the eve of the Earl's marriage was even less festive than usual. It now became Ezekiel's interest to get at Henry Aubrey, the heir-presumptive of the Earl. An astrologer had predicted quite a large number of things about this youth, and chiefly that he should involve his mother in some terrible disaster. Now Henry, who had been rather fast, and had "lost heavily on the turf," possessed a dangerous friend named Dr Bellini. The doctor belonged to a secret society for putting down kings and vivisectioning traitors, and somehow contrived that Henry should join that society, and should run up from Scotland to town, to borrow money from Ezekiel. In his absence an event occurred which is best given in the words of the author:—

"Has anything unusual occurred at Ravenstower since I left?" anxiously inquired Henry Aubrey of Dr Bellini, whom he found sitting in the library, with a map of Europe spread out before him at full length.

"Nothing very particular," said Dr Bellini, with his usual air of immobility, "with this exception, that your mother has become immortal."

"My mother dead! how, and when?" inquired Henry Aubrey.

"Do not get excited," said Dr Bellini, "death is as common as life, and probably more to be desired."

"Tell me," said Henry Aubrey, unable to control his rising emotions, "when I was deprived of the only being to whom I was attached upon earth."

"Be calm, and I will relate to you what has happened," said Dr. Bellini.

"I will control myself as far as I am able," said Henry Aubrey, dissolved in tears.

The doctor then explained that Henry's mamma, a somnambulist, had been gadding about in his room, and that he had casually shot her with a pistol:—

"It might have happened to you as well as to myself."

"It might, certainly," said Henry Aubrey. "Still, it is a most melancholy event, and deepens in my mind the impression that I am doomed to be the victim of misfortune. I ought to have told you, before setting out for London, that my mother was a somnambulist. I now see my error."

"You should have informed me of these circumstances," said Dr Bellini. "Had you done so, I should have taken precautions against the melancholy event which has occurred."

"I regret now I did not do so," said Henry Aubrey.

It afterwards appeared, when Mr. Aubrey revived his mother by pricking her hand with a lancet, that Bellini had only drugged, not shot, her. However, she died soon afterwards, while Aubrey's confidence in his friend was unbroken by the melancholy incident. At the funeral the Jew, who had run down from town to Seaclyffe, arrested the body of Aubrey's parent for her son's debt, and, if Lord Seaclyffe had not interfered, the mortal remains of the lady would have been taken to London. The interference increased Ezekiel's fury, because his enforced absence from town—he seems to have missed the express train—cost him "at least five thousand pounds." Shortly afterwards Henry Aubrey disappeared, and was found by the Earl on a desert island inhabited by an interesting anchorite. This hermit, who was the second son of an earl, had in youth wanted to marry a lady whom his relations did not approve of. After some delay, spent by the swain in a private lunatic asylum, the maiden went mad and drowned herself, and the anchorite shot his elder brother—an act which he often thought of afterwards with regret. As he put it himself, not without humour, "But for an unfortunate event, I would have succeeded, at the death of my eldest brother, to the estates and title of my father." After leading a roving life, the Anchorite married, and had a son, who was stolen from him by the villain Ezekiel, who never saw virtue that he did not persecute it. Nevertheless, the Anchorite had hopes of recognizing his offspring should he meet him in after-life—say, in a garden, with a pig-faced lady and a mermaid. "I should know him at once, by what you seldom see—pink-coloured eyes, hair as white as wool, and the figure of a cross impressed by his mother, who was a devout Roman Catholic, on the upper part of his right

arm." The reader must carefully keep in mind the existence of this noble youth.

Henry Aubrey recovered from the effects of his sojourn with the anchorite, and fell in love with the daughter of Ezekiel. The Jew made him promise to secure for his collection "one ounce of the blood, a lock of hair, and half of the heart" of Lord Seaclyffe's only daughter, the alternative being something like the bargain of Shylock. Aubrey was moved. "Of two evils," he said, "I suppose I must choose the least; I agree, but with reluctance, and a solemn protest against the injustice of the act." Not long after this arrangement the Countess of Seaclyffe disappeared. No trace was found of her except a coffin, which was drifted to the shore, "with the words painted on the wood of which it was made, in white letters, 'Died at sea, of a broken heart, the Countess of Seaclyffe.'" Overcome with grief, the Earl, on the recommendation of the false Henry, determined to travel and study archæology. "The Pyramids, of which we know as little now as was known three thousand years ago, might occupy your attention for one year, and, if you should resolve to remain for another, you might endeavour to penetrate the mystery which hangs over the source of the Nile." The Earl, with his work cut out for him, was to set off to anticipate M. Champollion and Sir Samuel Baker, while Henry Aubrey plotted against his infant daughter. But the claims of humanity delayed the Earl. An eccentric woman of genius, a *protégée* of his, was to be hanged for destroying one of her numerous illegitimate children. He stayed in England to resuscitate and rescue her after the execution, and was arrested as a magician. By the help of the woman, Henry Aubrey flattered himself that he had got rid of the henchman of Seaclyffe. He also tried to make a large dog worry the Jew, and he assaulted and nearly strangled an idiot, whom he then shut up in the ice-house of his extravagant establishment. Though apparently successful in these crimes, Henry Aubrey was not happy. The daughter of the Jew refused his hand, and neither imprisonment in a haunted room, nor the excommunication of the Synagogue, nor the incantations of a witch named Jezebel, had any effect on her resolution. Meanwhile the Jew himself had fallen on evil days and evil tongues. He was tortured in a variety of ingenious ways, and would have been actually roasted, which he knew that he could not stand, but for the clemency of King James. At the trial of Seaclyffe for witchcraft, the woman whom he had rescued made a number of compromising statements about the Earl's enemies, and it ended in Seaclyffe's acquittal. What more natural than that he should now at last carry out his plan of foreign travel, and pay a visit to the Dey of Algiers? In the most lovely ornament of the harem of that prince, or rather in the prince's most respected female friend, he recognized his long lost wife, who had never really, as the inscription on her coffin falsely stated, died at sea of a broken heart. On the contrary, she had been spitted away to Algiers by Ezekiel, and there her talents had charmed the leisure of the Dey, a truculent monarch with a taste for poetry and the arts. The feunited pair returned to England, where the Earl chanced to encounter a young man of unusual beauty—an amateur alchemist. "Tall and extremely handsome, nature had given him hair almost of snowy whiteness, and eyes of a pinkish hue, so that any one who saw him once would be sure to recognize him again." Naturally the Earl at once "spotted" the long-lost son of his friend the Anchorite. After this happy encounter all went well. Every one of Henry Aubrey's diabolical designs proved a failure. The dog would not worry the Jew. The idiot whom Henry had assaulted was none the wiser for his sojourn in the ice-house. The heiress of Seaclyffe, contrary to all expectations, turned up alive and was recognized by the fact that she had the mark of a daisy on her arm. "The Countess fainted from excessive joy," while the Anchorite prepared and partook of a simple repast, and every one wept on the bosom of his dear ones. The Jew repented and showed an exemplary contrition, the Anchorite regained his family honours, and his son, the Albino, was married by Mustapha to the daughter of the Earl of Seaclyffe. The reader will ask what became of Henry Aubrey. We regret that we are unable to gratify his natural and even laudable curiosity. * It is enough for us to know that in the bridal dress of the heiress of Seaclyffe "there was nothing either tawdry or pretentious"; and that Mustapha, at the wedding feast, wore an expression "which combined the wisdom of the sage, the resignation of a martyr, and the simplicity of a child." To be sure, it was not his marriage, so it was less hard for him to look resigned. Still a wedding breakfast is a trial, even to an Oriental sage.

The student is now in possession of the main facts in the romance of *Seaclyffe*. It is for him to decide whether the work does not contain one or two touches in which probability has been neglected, and local colouring rather hastily laid on. Without assuming a minute knowledge of a remote historic epoch, we do seem to detect here and there a flaw in the construction of the tale. With a conscientious regard for the bibliophile of the future, the author has announced on the title-page, that this is "the first issue" of his really remarkable publication. The moralist will regret that the writer's sense of poetical justice is so easily satisfied in the case of Henry Aubrey, who really, in spite of his beautiful language, was not at all a good sort of man. The Anchorite, too, is thought none the worse of by society on account of that business of the fratricide, and the Jew is asked to the wedding of the heiress of Seaclyffe, just as the Hebrews are invited to the marriage of Daniel Beronda. He is a nice Jew, this Daniel's friend, but still not at all a respectable character.

The affront offered to Ireland is of a shadowy nature. The other provisions of the Continuance Bill were unopposed, except indeed that Captain NOLAN thought fit to object to the Masters and Servants Bill, on the ground that a new measure ought to have been introduced in the present Session. Saturday morning was, as some of the speakers admitted, devoted exclusively to Irish affairs, though perhaps the choice of an unusual day may be thought to have involved a slight. Objections were as easily made to the principle of coercion as if the Bills had not been contemptuously amalgamated with a mass of uninteresting English measures. It appears that, as might be expected, peaceable persons living under a strict and exceptional law are occasionally subjected to inconveniences for which they receive no equivalent except in the greater security of their persons and property. One member related a touching story of himself and his son, beginning with the bursting of a gun-barrel which could not be sent to Cork for repair until it was taken there by a friendly magistrate. The Inspector of Constabulary could only take charge of the damaged implement when he had occasion to send an escort to Cork. Perhaps he was afraid that otherwise Fenian conspirators might obtain possession of the formidable weapon. The speeches against the Coercion Acts were perhaps not absolutely decisive. Some members referred to the diminution of crimes of violence, and to the satisfactory reports of the Judges of Assize, in proof of the tranquillity of Ireland. The condition of the country has greatly improved during the last two or three years while the exceptional Acts have been in force. It is entirely uncertain whether order would have equally prevailed if there had been no check on the seditious extravagance of the newspapers, and if the population had been allowed to provide themselves with firearms. Some time has probably elapsed since a suspected prisoner has been committed who might, under the ordinary law, have claimed his release by writ of Habeas Corpus. The knowledge that the authorities are armed with sufficient power inspired a wholesome caution. The continuance of the Peace Preservation Act and the Habeas Corpus Suspension Act are the only measures specially affecting Ireland which have been passed during the present Session. The Irish Judicature Bill would, even if it had been pressed, have excited little enthusiasm. Irish lawyers, though they acknowledge the propriety of establishing the same Supreme Court for the whole of the United Kingdom, have for the most part been opposed to the abolition of the judicial functions of the House of Lords. The proposed reduction in the number of Irish Judges was highly unpopular, although Mr. SULLIVAN professes to approve of the project. When the CHANCELLOR of the EXCHEQUER appealed to the forbearance of Mr. BUTT and his supporters on the ground that a reasonable portion of the Session had been devoted to Irish affairs, he referred to the debates on Home Rule, on the purchase of Irish railways, and on the Irish judicial system, and to other discussions which, however instructive, were utterly barren of result.

The considerable body of Home Rule members who were returned at the general election have on the whole done no discredit to their constituencies. It fortunately happens that neither party had any sufficient motive for bidding for their support, and consequently they have not, like their predecessors in former Parliaments, complicated political calculations by alliances formed for special purposes. On the majority of questions the Home Rule members support the Liberal party, if only because it happens for the present to be in opposition. In former times Mr. DISRAELI repeatedly made overtures for an understanding with the Roman Catholic members; and he might perhaps have ultimately succeeded if his combinations had not been defeated by the imprudence of the late Lord DERBY. Since the date of the Irish Church Bill Mr. DISRAELI has become a zealous Protestant, and his opposition to Rome has recently been stimulated by the unexpected interest shown by the House of Commons in the Public Worship Bill. On every ground Mr. DISRAELI would now be disinclined to court the Irish Roman Catholics; and he is independent of their Parliamentary support. Mr. GLADSTONE has since the first days of the Session absented himself from Irish discussions; but Lord HARTINGTON expressed in the strongest language, and with the apparent approval of his political associates, the firm determination of the party not to tamper with the integrity of the United Kingdom. Left to themselves, the supporters of Home Rule have offered no factious interruption to general business, nor can it be said that they

have occupied an unreasonable space of the time the disposal of Parliament. Mr. BUTT had long been known as a fluent and effective speaker. Mr. SULLIVAN has in his first Session displayed considerable oratorical power. There is no reason to expect that during the continuance of the present Parliament the cause of Home Rule will be materially advanced; but its promoters have done their cause no injury. In the division on Mr. BUTT's motion for Home Rule they attained the estimated number of sixty votes; and they ascertained that, with one or two insignificant exceptions, they have nothing to hope from any alliance with English or Scotch Liberals of an extreme type. Only a few candidates in Great Britain condescended at the last election to bid for the votes of the Irish population in large towns by promising to join in the agitation for the dismemberment of the Empire. Not one among the scanty number ventured to speak in favour of Mr. BUTT's motion.

The most exciting debates of the Session have had little interest for Irish Roman Catholics. The Public Worship Bill affected them as little as the Bill for abolishing patronage in the Scotch Church, and the Endowed Schools Commission had exercised no jurisdiction in Ireland. The most gratifying result of the Session to the more far-seeing Home Rule members probably consists in the failures and disasters which have befallen the Government, though they have enjoyed a partial triumph in their opposition to the Continuance Bill, and also in the exhibition on Thursday night of a pertinacity especially congenial to their feelings. The Conservative majority is still unbroken; but there are symptoms of divisions in the party, if not among the Ministers themselves. The official promoters of the measures which have been withdrawn acquiesce only ostensibly and under compulsion in the disappointment of their hopes. Notwithstanding the great advantages with which he commenced the Session, and the disorganization of the Liberals during the prolonged absence of their leader, Mr. DISRAELI has not hitherto succeeded in making use of the power with which he was entrusted by the country. Advocates of Home Rule and of other mischievous innovations are beginning to recover courage in the anticipation of another political change which may restore their power of deciding the conflicts of evenly-balanced parties.

THE WORSHIP BILL IN COMMITTEE.

ONLY a courageous man could venture to sum up the final character of the ARCHBISHOPS' Bill until it has come up again to the Lords and back to the Commons. But enough has taken place in the Lower House to show that it will very certainly disappoint both the hopes and the fears with which its friends and its foes received its first proclamation by the hand of the "clever fellow." It was unblushingly brought in as a measure to put down what is called Ritualism by prelates whose official responsibility ought to have been a guarantee for their restraining rather than inflaming popular prejudice against undefined classes of clergymen, some of whom, as the ARCHBISHOPS well knew, were only Ritualists in the language of excited Puritanism, while others were men whose wayward extravagances were qualified by conspicuous self-sacrifice in the discharge of their pastoral office. In the hands of the Commons it has become an engine to enable an irresponsible Episcopate to enforce a hard and obsolete, not to say impossible, compliance with the Act of Uniformity upon all the clergy of the land, in disregard of moderating considerations of local circumstance and charitable common sense. This is as far as it goes a gain. The Bill in its earlier form of partial persecution might have worried out of the Established Church a party which has, at all events, the merit of possessing no small proportion of the learning and the devotion with which the Establishment can as a whole be credited, while the Puritan and latitudinarian residua would have soon learnt that if ever a threefold cord is unluckily broken, the weakened strands are unable to resist the slightest tension. As it now stands, it torments impartially, and, considering that the cuticles which can least resist the stings of parishioners who are not only aggrieved but rubrical are those of the votaries of the Church Association, we imagine that the Bill will not have very long become a reality before some of its warmest friends will gladly welcome a *modus vivendi* such as Convocation has undertaken to provide during the coming year.

This condition of things has been reached from peculiarities attaching to the composition of the House of

heterogeneous Conservative majority which are only just straggling into prominence, but which will probably assert themselves before the term of the Parliament has run. Mr. GRADSTONE's capricious and unexpected dissolution naturally produced a general scramble after seats on the principle of "first come first served," so that while in all likelihood the relative proportions of the parties were not much affected by the *coup d'état*, the antecedents of individual members were more local than would have been the case had there been a longer time to select candidates. On the whole Puritanism made no very conspicuous figure on the hustings except in one district. Lancashire Toryism having long taken "No Irish need apply" as its motto, its political religion has become conspicuously Protestant after the model not of the Prayer-book, but of Exeter Hall. So long as the Conservatives were out, the Lancashire squadron shared in the modest labour of making up minorities; but now that the party to which it belongs is on the SPEAKER's right hand, the hard-headed men, in whom great natural shrewdness contends with narrow education and provincial prejudice, have affected towards Toryism the attitude which the Irish, the Scotch, and the philosophic cliques successively assumed in regard to Liberalism. Their vehemence in pushing this Bill to a second reading carried with them the rank and file of country gentlemen, who are certainly not Ritualists, but who as a body as little accept Puritanism. These, however, were, so far as they acted consciously, animated by an honest, though contracted, idea of rigorously maintaining positive law, and it was not long before, in opposition to their Northern taskmasters, they carried words enacting that defect of ornament and vesture should be as unlawful as its excess. The concession is threatened on the Report, but anyhow the fact of its having been carried in the Committee must tell, while its excision would brand the Bill with a fatal mark of insincerity. Mr. DISRAELI has characteristically been sitting dumb during the Committee and waiting to see which side appeared most immediately popular. The lungs at all events of Lancashire prevailed, and he now walks a man of God hardly inferior in sanctity even to Lord PALMERSTON. If we could suppose that this alliance was likely to be permanent, we should anticipate difficulties for the vexed Establishment; but we can hardly imagine that a party who are at all events high-spirited and generous, and to whom the dogmatism of Lancashire politics has long been intolerable, while they had only to vote against it, will submit to its dictation now that it has mounted the Orange cockade and claims to rule their actions.

The discordant impulses under which the majority pressed the Bill on Tuesday evening manifested themselves in a rampant display of incredible inconsistency. Somewhat early in the debate the Committee hampered the wholesome discretion of quashing vexatious proceedings, which the Bill as it stood reserved to the Bishop, by creating an appeal to the Archbishop which was at once insulting to the suffragans generally, whom it stamped as unworthy of ordinary confidence, and also provocative of all the petty irritations in which ill-conditioned parishioners are invited to indulge at absolutely no personal expense. The Committee which had thus branded the Bishops of England as men unfit to walk alone was at the close of its proceedings called upon to consider the only one thing wanted to complete the absolute impartiality of the remedy which the Bill professed to apply to the disorders of the Church. All churches without exception—parish churches, cathedrals, abbeys, and college chapels—have been dragged into its clutches; all priests and deacons, from the Deans of Canterbury and Westminster to the curate of six weeks' standing, are amenable to its monitions and deprivations. Only the Bishops—men who have never been taxed with any superfluous regard for rubrics, and whom the Committee had just pronounced unworthy to be left in enjoyment of discretion over the prosecution of frivolous suits—had no place in the otherwise all-inclusive system. Accordingly, a clause was moved to enforce rubrical conformity upon the Bench by provisions founded *mutatis mutandis* on the remaining Bill. All at once the men who had previously been snubbing the united body of suffragans burst out—the proposal could not be serious, it was degrading the rulers of the Church, Bishops could not do wrong, the Bill would be lost, and so on—and the suggestion was rejected by a majority not much less than the one which crippled episcopal discretion. Mr. DISRAELI voted with the majority, Mr. HARDY, Sir STAFFORD NORTHCOTE,

and Lord JOHN MANNERS with the minority, while the Lancashire phalanx was on both occasions upon the winning side.

This display of unfairness was almost sublime in its effrontery, but the ruling clique had already exhibited a petty and ignorant jealousy which was in its way equally instructive. The Bill, as it went into Committee, concluded with a clause of exemptions, in which, with other places of worship which could not plead the same positive claims, the College chapels and University churches of Oxford, Cambridge, and Durham were recited. Sir WILLIAM HARCOURT—forgetful that while a member at Oxford he is a Professor at Cambridge—burst into one of those declamatory appeals to Puritan suspicion in which he has lately been shining, and Lord SAXON capped the stilted acrimony of the front Opposition Bench. The claim for the exemption of the Universities was nothing less than statutory. The University Tests Act of 1871, while providing for the maintenance of Church of England worship in the chapels, lays down that, in spite of the Act of Uniformity (which it recites), the visitor may sanction the adoption by the College authorities on week days of a service "selected" or adapted from that of the Prayer-book, while the Shortened Services—or more properly Act of Uniformity Amendment—Act of the following year particularly refers to, in order to confirm, this provision. Dr. BALL attempted to show that the College chapels got nothing more from the University Tests Act than that which the Act of the year after conferred on all parish churches; but his argument rested on a misapprehension. The Shortened Services Act lays down specific omissions which, and which alone, a clergyman may make in the prescribed order of morning and evening prayer, while he is bound to observe the regulated sequence of parts. The Universities Act permits the authorities of each College to rearrange the *disjecta membra* of the services according to their own discretion. As to the University churches, every one knows that a main feature of the Oxford or Cambridge Sunday is the University sermon, with the short and specific service with which it is accompanied. But there were even deeper objections to the rejection of the clause. At present there is no machinery to work the Bill in any College chapel; while it would be difficult to construct any which should be consistent with its principles of encouraging congregational objections, and which should not either set up students as delators of the authorities under whom they were placed, or proceed on the assumption that their souls were worth less than those of graduates. Besides, the chapels are, as Mr. HENRY pointed out, of a private character, and the Universities themselves had unequivocally expressed the value they set on the exemption. All these reasons were pressed, but the Lancashire members would see nothing in the clause except a deliberate attempt to practise unlawful rites on the part of institutions about which it was pretty clear that they know little and cared less, and, as on other divisions, they led the large proportion of the House into their lobby. The natural sequel of this heedless legislation is that Mr. RUSSELL GURNEY has to encumber the Bill on the Report with a perfectly useless and unworkable, but not less vexatious, clause, which is intended to bring the chapels of the Colleges and of the Inns of Court within its scope by substituting visitors for bishops, and graduates or barristers for parishioners.

THE DEBATE ON DISSOLUTION.

THE result of Wednesday's debate in the French Assembly was so well ascertained beforehand that no considerable speaker seems to have troubled himself to take part in it. It is probable that the present Assembly will stay where it is until its departure is gently accelerated by external pressure. Public and private motives alike prompt a majority of the deputies to this course. The Assembly has had very good reason to be ashamed of itself, and representative bodies in this position are naturally slow to face their constituents. No matter which theory is adopted as to the charge committed to the Assembly in 1871, the deputies will equally be found wanting. If we say, with the Republicans, that it was elected to make peace with the Germans and to provide for the burdens which the acceptance of peace involved, it has clearly stayed beyond its time, and wandered off into discussions with which it had, properly speaking, no business to meddle. If we say, with

the Monarchists, that it was elected to decide between Monarchy and the Republic, and to rejoice the heart of every true Frenchman by restoring him to the loving arms of a legitimate King, it has equally failed in its duty. The one thing that it has done is a thing that could by no possibility have been foreseen at the time of the election. It has created the Septennate. Even then it has liked its own creation so little that it has refused to go on with the work. These are not the antecedents which make the prospect of dissolution pleasant. To have done that which you were never bidden to do, and to have left undone that which you were bidden to do, is good material for a general confession, but election addresses ought to take a less penitential strain. It does not require much modesty to teach a deputy who feels that absolutism is all that he can ask, and more than he deserves, that his re-election is very improbable; and country life in France is not so amusing that men who have left it behind for the first and last time should be anxious to make their stay at Versailles any shorter than it need be. The daily debates yield some excitement, and the mere thought that he is somebody, even though it be only one among 750 somebodies, is a pleasant change to a man who before 1871 had never dreamed that such a distinction was reserved for him. Public grounds for dreading a dissolution are not so completely wanting but that a deputy who dislikes being candid with himself may easily find another explanation for voting against the proposal. After all, nobody can certainly predict what sort of people the new deputies may be, and to entrust the future of France to men about whom all that we know is that nothing can be known would be an act of great rashness. Of course the deputies who rely on this argument forget that to leave the future of France in the hands of men who have proved that they are quite unfit to have such a trust committed to them is an act of equal or greater rashness. But it is not easy to convince timid people that inaction may be as dangerous as action, or that when the tide is rising a boat may be safer than a rock. The present Assembly does not mean to do any mischief, and this is more than can be said of any future Assembly. There is great persuasive force about a statement of this kind, and in various forms it makes the staple of most of the reasoning against an appeal to the country.

A more interesting question than the probability of the Assembly dissolving of its own free will is the probability of its being compelled to dissolve by a hint from Marshal MACMAGON. In his speech on Wednesday the new MINISTER of the INTERIOR resorted to the expedient, so well known to mothers, of taking for granted that the deputies were going to be good children and do just what they were told. They have been a little fractious lately, it is true, and have made wry faces at the Septennate whenever that necessary, but untempting, dose has been offered them. But this is quite accounted for by the heat of the weather—always a disturbing element in large nurseries—and General CHABAUD LATOUR feels sure, or says that he feels sure, that when the summer is over the Assembly will return with a firm determination to spend the winter afternoons profitably. On reassembling, my dears, we shall discuss the constitutional laws, and there will, I am convinced, be a sufficient number of good children among you to pass them in a shape adapted to the interests of the country. Your father and I advise you to take your usual rest, and by way of holiday task to ascertain the wishes of your constituents. On your return you will be disposed—this is a point on which no doubt can be permitted for a moment—to pass laws designed to “give the MARSHAL additional strength, and to produce that “calm indispensable both to those who work and those “who wait.” What those last words—which suggest that General CHABAUD LATOUR has lately been studying MILTON’S sonnets—precisely mean is not obvious, but the general drift of the Minister’s speech is plain enough. The Assembly has pledged itself to give Marshal MACMAGON certain additional powers. The MARSHAL expected that this pledge would have been fulfilled before the prorogation; but he is willing to give the Assembly another chance of life by extending the time allowed it to make good its promise. If the Septennate is organized next winter the MARSHAL will be satisfied, and with this intimation he dismisses the deputies to their homes. When they come back to Versailles they will know what the work to be done is, and that the only alternative open to them is to do it themselves or to find a way for those who will do it. If

they choose the first, and pass the constitutional laws in a shape agreeable to the MARSHAL, all will go well. There will be no dissolution, and France may rest content under an Assembly which, if it does not represent its constituents, at least knows what is good for them better than they do themselves. If the constitutional laws are again postponed or defeated, the Government will have no difficulty in getting rid of the Assembly. The minority in favour of a dissolution is large enough to be converted into a majority by the mere addition of the Cabinet and their immediate supporters, and even if it were not so, no party would like to incur the discredit of seeming afraid to meet the electors when once Marshal MACMAGON has declared that the time has come for them to do so.

The question whether there will be a dissolution after the recess resolves itself therefore into the question whether it is possible to construct a majority in the present Assembly in favour of organizing the Septennate. There are only two ways in which this object can be attained. One is to organize the Septennate pure and simple—to return, that is, to the old Right Centre idea; the other is to organize it in conjunction with the Republic—to adopt, that is to say, the Left Centre idea. It would probably be possible to secure a working majority in favour of the latter scheme provided that the Government would support it. But then there is nothing to show that the Government is prepared to support it. Marshal MACMAGON apparently holds that he is equally bound to prevent the Republicans from stealing a march on the Monarchists, and the Monarchists from stealing a march on the Republicans. So long as he adheres to this view he cannot vote for, or even remain neutral on, the CASTAINE-PÉRIER or any similar proposal, and the Republicans are not strong enough in the Assembly to carry their point without the aid, still less against the opposition, of the Government. What the MARSHAL himself would probably like would be to reunite the old Conservative majority, and vote a Constitution identical with that which the Duke of BROGLIE was unable to carry. The *Times*’ Correspondent makes a statement which is ominous of failure as regards this scheme. The Legitimists, he says, are determined to make one more effort to restore the COMTE of CHAMBORE, and they will make it during the coming recess. Now the old Conservative majority cannot be reconstructed without the Legitimists, and the principal occupation of the Duke of BROGLIE for some time to come will be to convince them that it is their best policy to act once more with the Right Centre. What chance will such a tame suggestion as this have with men who are already engaged in the exciting business of scheming for the last time to effect a Restoration? While this latter plan is in the air the Duke of BROGLIE will talk to deaf ears and preoccupied hearts. When this project has again been defeated the counsels of the Right Centre will be more distasteful than ever to the Legitimists. They will be accusing the Orleanists of treachery to the Monarchical cause, of self-satisfied interference with the plans of their lawful sovereign, of a disloyal determination to subject HENRY V. to restrictions which would have been rejected by the greatest of his ancestors, and were only assented to by the most unfortunate of them. Men who bring these charges in earnest are not easily won over to co-operation with the men against whom they bring them. The Legitimists will not have even a second vote to give to the Septennate: they will probably hold that even the most extreme Republican is a more respectable, because a more open, foe than an Orleanist. Consequently when the Assembly meets again their hostility will be even more pronounced than it has been this Session. The misdeeds of the Orleanists will be fresher in their recollection, and their determination to tempt any dangers rather than accept safety at the hands of the Right Centre will be proportionately resolute. So far, therefore, as it is possible to forecast what will happen three months hence in France, it seems likely that Marshal MACMAGON, finding himself hemmed in by the Republic on one hand and a Restoration on the other, will try what a dissolution will do to help him out of his dilemma. He has more faith in the Septennate than most of his countrymen, and he may perhaps be genuinely convinced that a general election would return him a more manageable Assembly.

CANADA AND THE UNITED STATES.

THE proposed Reciprocity Treaty between Canada and the United States will probably be eventually concluded, although the Senate has, perhaps for the purpose of proclaiming its indifference, adjourned without taking the project into consideration. In a certain sense it is an anomaly that a dependency should negotiate an important treaty with a foreign Power; nor can any Reciprocity Treaty fail, at least in the first instance, to be injurious to English commerce. It may nevertheless probably be expedient to acquiesce in the proposed arrangement, and even to take part in the negotiations, as far as may be necessary for the removal of diplomatic difficulties. Canada is loyal to England, on the well-understood condition that the colony is never to make a sacrifice for the benefit of the mother-country. If the Canadians think that free commercial intercourse with the United States is indispensable to their prosperity, it would be difficult to prevent their acceptance of conditions which may be injurious to England and even to themselves. It is uncertain whether the whole North American Continent may not at some future time be united in a single Confederation; but few Englishmen desire to accelerate the union. Any attempt to obstruct the establishment of Free-trade between Canada and the United States would furnish a powerful and plausible argument for the annexation which the majority of American politicians hold to be inevitable. By a curious inconsistency Protectionists in the United States, as in Russia, are at all times willing to remove further and further off the barrier which is to exclude foreign competition. The same Congress which maintains distinctive duties on imported commodities would gladly institute Free-trade with neighbouring countries on a condition that they should be included within the dominions of the Union. The popular opinion on proposals for reciprocity will be mainly influenced by the light in which a close commercial connexion with Canada may be regarded. After the close of the war, the former Reciprocity Treaty was denounced by the Federal Government in resentment of the impartiality or Confederate sympathy which was attributed to the colonists. The American manufacturers probably stimulated the feeling which found vent in the rupture of commercial intercourse, but the measure was due rather to national passion than to selfish calculation. A renewal of the treaty may perhaps now be made popular as a commencement of the process which is to detach Canada from the English Empire. The effect of commercial relations in facilitating political union has received a striking illustration in Germany. The States which formed the Zollverein had become accustomed to the supremacy of Prussia long before the establishment either of the Northern Confederacy or of the more recent Empire. It is not proposed by the promoters of the Reciprocity Treaty that Canada and the United States should agree on a common tariff, but one of the objects of the American negotiators is to discourage the importation of English goods into Canada as well as into the States. Hereafter it is not improbable that the inland Custom Houses will be altogether abolished.

The authors of the Washington Treaty gave the first impulse to the present movement by opening the Canadian fisheries to the citizens of the United States in return for a similar privilege allowed to Canadians in American waters. As it happened that the Canadian fisheries were valuable and the New England fisheries almost worthless, it was provided that a money payment to the Canadian Government should form part of the consideration. Rights of passage were at the same time granted over the ship canals on either side of the St. Lawrence; and the details of the arrangements both as to the fisheries and the canals were referred to future negotiation. By the projected treaty the money payment is to be remitted in consideration of the commercial advantages of reciprocity; and both Canada and the United States agree to improve their respective canals so as to connect for joint use the upper waters of the great lakes with the sea. The object of the agreement seems to be laudable; and it must be presumed that the Canadian negotiators will take care that their rights and liabilities are fairly balanced. It is for the general interest that all land and water highways should be freely open for the use of all nations. If two neighbouring communities, accustomed to daily unrestricted intercourse, become in the end unconscious of the imaginary line by which they are separated it is not in the power.

nor is it for the interest, of England to prevent a virtual union which may perhaps afterwards assume a more formal shape. Yet it is a cause for reasonable regret that ignorance and prejudice should render it necessary for Canada and the United States to provide artificially for an intercourse which, but for vicious laws, would be independent of diplomacy. The Reciprocity Treaty is not an unqualified advance in sound commercial policy. As far as Canada is concerned, Free-trade with the United States implies distinctive duties on English trade, to be either directly or indirectly imposed. Since the abolition of the former Reciprocity Treaty Canada has been induced to cultivate foreign commerce; and the experiment has been so successful that the Dominion is, after England and the United States, the first of existing communities in the magnitude of its commercial marine. The duties on imports, although they are improperly high, have been for the most part imposed for the legitimate purpose of revenue, although, like all new countries, Canada bankers after the imaginary independence which is supposed to be secured by the establishment of native manufactures. According to the terms of the proposed treaty all Canadian produce is after a certain interval of time to be admitted into the United States free of duty; and consequently the temptation to cultivate and to protect domestic manufactures will be increased in the proportion which the American market bears to that of the Dominion. If the plan is adopted, English products will still be liable to heavy duties on the American frontier, while similar articles made in Canada will be entitled to free admission. It will become the interest of Canadian dealers to prefer domestic manufactures; and eventually perhaps the American tariff may be applied to sea-borne goods entering Canadian ports. The liberality of the American Government may be explained by the backward state of manufacturing industry in Canada. If the United States manufacturers should find themselves able both to undersell their neighbours and to exclude the productions of European competitors, they will justly applaud the acuteness of their diplomatic representatives.

As English interests are not likely to be regarded by the negotiators on either side, it may be prudent to accept without reluctance an arrangement which will in some respects be beneficial both to Canada and to the United States. The monopoly of the fisheries concerns the Canadians alone; and while it was not likely to be given away without an equivalent, it was a dangerous though valuable possession. American fishermen were incessantly poaching in Canadian waters, and successive Secretaries of the State Department were ingenious in discovering legal excuses for the trespasses which were committed by their fellow-citizens. It was never easy to come to an agreement as to the measurement of the limit of three miles which bounds the appropriated marine territory. One party demanded that the boundary should follow every indentation of the coast; while the Canadians wished that the line should be drawn from headland to headland. If a Canadian cruiser seized an intrusive fishing-boat the commander of the nearest American ship of war was generally ready to remonstrate, and occasionally to threaten recourse to force. It was not a gratifying reflection that, among the many concessions by which the Treaty of Washington was purchased, the English plenipotentiaries had surrendered the Canadian fisheries. If the American fishermen are admitted to share in the fisheries by the provisions of a local Reciprocity Treaty, no reasonable objection can be made to the free disposition of property by its undoubted owners. When at some distant time political majorities in the United States learn the rudiments of political economy, Reciprocity Treaties will become obsolete. In the meantime, while Canada will suffer by any augmentation of the tariff on sea-borne goods, the advantage of the treaties to the United States will be almost unmixed. The mischief of a Protectionist policy varies inversely with the area in which it is practised. The North American States constitute a little world of their own which will be doubled in extent by the inclusion of the Canadian Dominion. The French provinces before the Revolution, and the little German States before the establishment of the Customs Union, were debarred from commercial intercourse with their immediate neighbours. The Pennsylvanian ironmasters are compelled to content themselves with the exclusion of England and Belgium from equal competition. If Canadian minerals should be worked on a large scale, American producers must be prepared for equal contest. They are probably fitted in the

hard to attach discredit to Marshal MACMAHON for the conduct of inferiors whose names he has never heard. But there is no getting over the fact that strong Governments have a way of inspiring dread in their most distant subordinates, and that, when this sentiment is markedly wanting, it is a fair inference that the qualities which are supposed to create it are wanting also. Indeed, it matters but little whether the inference is fair or unfair; for, whichever it is it will not be the less drawn. Marshal MACMAHON'S Government may be the victim, as regards M. BAZAINE, of undeserved misfortune, but the opinion which Frenchmen will form of it will certainly be less compassionate. They will be inclined to say that a Government which cannot obtain from the Legislature the powers that it has itself declared to be essential, which cannot control the strife of parties or find a single politician willing to take office under it, and which in two conspicuous instances has proved itself unable to keep its prisoners under lock and key, must be a very weak Government indeed. This is not exactly the character with which it will be convenient for Marshal MACMAHON and his Ministers to meet the Assembly next November.

There is another view that may be taken of M. BAZAINE'S escape which, though certainly untrue, may not for that reason be the less injurious to the Government. Frenchmen are naturally suspicious, and treachery is the explanation which most often suggests itself when any misfortune happens to them. The Government has been suspected of Bonapartist tendencies before now, and it is not unlikely that this suspicion will fasten itself with increased intensity upon the facts that the leading Bonapartist general has been condemned to death, has had his sentence commuted, has been treated with remarkable leniency during his imprisonment, and has finally been allowed to escape. Of course no one whose judgment is worth considering will come to this conclusion, but then the mass of every nation is composed of persons whose judgments are individually not worth considering. It is not the real evidences of complicity with a political party that make most impression on them, but some superficial symptom which strikes their fancy as having some occult meaning which never belonged to it. There was a time when to have been suspected of Bonapartist leanings would have been the worst fate that could have befallen a French Government, but this cannot be said now. It is not at all clear that the charge of conniving at M. BAZAINE'S escape, even if it is generally believed by the more ignorant part of the population, will make Marshal MACMAHON'S Government unpopular. It is quite possible that the effect of it may be to strengthen the belief that the Empire will some day be restored, that Marshal MACMAHON foresees this as clearly as other people, and that he is shaping his conduct accordingly. This is the sort of impression which Bonapartist agents ought to be able to make a good deal of, and, if they come upon any traces of it, they may be trusted not to let the occasion go unimproved. It is just possible that this state of things may somewhat alter the attitude of the Government towards the Left Centre. The composition of the present Cabinet is supposed to be strongly anti-Imperialist, and the suspicion of Bonapartism will consequently be one of which the Ministers will be extraordinarily impatient. In this frame of mind they will be disposed to look about them for some means of convincing the country of its blunder. Measures of administrative severity will hardly serve their purpose, partly because the Bonapartist agents will have sense enough to be exceedingly careful not to give the authorities any excuse for taking steps against them, and partly because proceedings of this kind are very easily represented as being mere blunders. The measure which would most dash the reviving hopes of the Imperialists would be the establishment of a genuinely Conservative Republic; and if the MARSHAL and his Cabinet should see this at the eleventh hour, they may be inclined to revive M. CASIMIR-PÉRIER'S motion in order completely to dissociate themselves from a system which they dislike even more than they dislike the Republic.

If any lingering hopes of reconstructing the old Conservative majority have survived the Session, they must be destroyed by a remarkable outspokenness of the Legitimists. They have insisted on dragging the extraordinary humility of the Right Centre into the full light of day. Whatever other faults this party may possess, it is certainly singularly free from undue sensitiveness. Every time that it has been smitten it has turned the other cheek to the assailant, and asked for the agony of a second blow. There is, we sup-

pose, a point at which even an Orleanist would turn, but where that point is has not been discovered. The Extreme Right have done their best to find it out, but as yet each new insult has only provoked a fresh act of submission. The last turn of the roller has been administered by M. BÉNAZET, the President of a "Congress" of provincial Royalist newspapers. In a letter to his brother editors he sets out at length the occasions on which the policy of the Right Centre has been thwarted by the Extreme Right. He goes back to the end of April, when the same journalists dared to set up the banner of France in the presence of the men who had rejected their King because he had refused to accept the banner of the Revolution. He reminds his colleagues that at the very time when the Duke of Broglie was preparing to organize the Septennate, they conjured the Royalist deputies not to vote any of the constitutional laws which the Ministry were about to submit to them, and that fifteen days later the Duke of Broglie fell through the action of the Extreme Right. Notwithstanding this, the Government of Marshal MACMAHON did not renounce the idea of organization. The President of the Republic appeared on the scene in person. Then followed in quick succession, the review with the Order of the Day, the imperative Message, the orders carried by M. DE BOURGEOIS to the Commission of Thirty, the suspension of the Union. All this parade came to nothing, owing to the constancy of the Extreme Right. The Government, continues M. BÉNAZET, has been driven to take refuge in an adjournment which it had at first refused. It has covered its retreat by an attack upon the Republic, but every victory gained over the Republic is a victory for the Extreme Right. By forcing Marshal MACMAHON to quarrel with the Republicans, they have destroyed the best chance that the Septennate had of establishing itself. This analysis of the second half of the late Session has the merit of being entirely true. M. BÉNAZET claims no praise for his friends to which they are not justly entitled. The labours of the Assembly have come to nothing because the deputies of the Extreme Right have so determined. They have willed that no constitutional laws should be passed, and none have been passed. They have willed that the Duke of Broglie should cease to be Minister, and he has been turned out of office. They have willed that no more business should be done this Session, and General DE CISEY has become suddenly convinced of the Assembly's need for repose. The power of the Extreme Right is beyond dispute. Every other party in the Assembly has been obliged to see its wishes go unfulfilled. The Republicans cannot organize the Republic, the Right Centre cannot organize the Septennate. But the Extreme Right, which was equally bent upon defeating both proposals, has been able to defeat both.

It must be clear, one would think, to the least intelligent member of the Right Centre that a party which expresses itself in this way, just at the moment when the Duke of Broglie is about to move heaven and earth to bring the Right Centre and the Extreme Right into agreement, is absolutely resolved to make no concessions. The temper of the Legitimists has become more unbending in proportion as their hopes have grown fainter. They never had less chance than they have now of placing the Count of CHAMBORED on the throne, and they never were less inclined to offer practicable terms to the allies without whose co-operation their prospects can never be any better than they are. It seems incredible that the Right Centre can long go on expecting to change a determination which only grows stronger under adverse circumstances. Perhaps the cessation of these hopes may lead the party to support Marshal MACMAHON if he should be induced by other considerations to make a move in the direction of the Republic.

RAILWAY DIVIDENDS.

NEARLY all the great English Companies have announced their dividends for the half-year; and the prospects of shareholders will not be rendered more cheerful by the forthcoming Reports of the Scotch Companies. The collective loss, as compared with the corresponding periods of 1872 and 1873, is heavy, though the decline had been anticipated. The dividends of the most prosperous lines, such as the North-Eastern, the North-Western, the Lancashire and Yorkshire, and the Midland have fallen by an average amount of 1½ per cent. per annum. As the ordinary stock of these four Companies exceed 80,000,000, the income of the proprietors for the half-year

is reduced by 500,000*l.* The dividends on Preference Stock and the interest on Debenture Stock are of course unaffected by the stagnation of traffic and the increase of working expenses. Less flourishing Companies suffer in a much larger proportion. The Manchester, Sheffield, and Lincolnshire Company pays at the rate of $\frac{1}{2}$ per cent. on 4,000,000*l.* of ordinary stock; the North Staffordshire Company at 1 per cent. on more than 3,000,000*l.* In both cases a small diminution of receipts would have left the shareholders without an income, and would perhaps have prevented full payment of the preference dividends. The Great Eastern Company pays no dividend on upwards of 8,000,000*l.* of stock; and a part of the preference dividend has not been paid. The needier class of proprietors will suffer severe hardship; and if the depression continues, the railway service will certainly not be improved. Shareholders will derive faint consolation from the probable suspension of the popular clamour to which they are subjected during seasons of prosperity. It can scarcely be expected even by railway theorists that lines should be unnecessarily doubled at a moment when the capital already expended produces little or no return. The Board of Trade itself will perhaps be inclined to reconsider its approval of the proposal that all existing tariffs shall, as Mr. Warr lately suggested, be summarily abolished, to be replaced by rates arbitrarily fixed by the Railway Commissioners. The Legislatures of some of the Western American States lately attempted to violate in the same manner the conditions on which capitalists have provided for the public benefit the means of railway construction. It may be hoped that the Parliament of the United Kingdom is not prepared for a similar confiscation of property merely because it happens to be held in shares and not in bulk. Railway proprietors have no right to complain of the vicissitudes which attend their speculation; but when their pockets are empty they are, according to the Latin adage, entitled to sing in the presence of the would-be robber at the Board of Trade or elsewhere. The tradition of liberality and efficiency is so fully established among directors and railway managers that much provocation and discouragement will be required before they can be induced to reduce the standard of accommodation to a Continental level; but railway reformers ought to remember that there are limits to the endurance of shareholders who receive 1 per cent. on their investments. On the other side, Railway Boards would be well advised to anticipate legislative interference by abandoning some practices which are the more perverse because they are wholly unprofitable. There is no reason why railway tickets should not be obtainable at any time which may suit the convenience of passengers; and in many cases neighbouring Companies might time their trains to run one another more conveniently than at present. Various drawbacks to the admirable organisation of the English railway system produce a prejudice altogether disproportionate to their number and magnitude.

Although trade and manufacturing industry have thus far shown few indications of recovery, some of the causes which have produced a diminution of railway dividends already tend to disappear. The cost of steel rails has fallen from 17*l.* to 11*l.* per ton; and the cost of iron rails from 11*l.* to 8*l.* The whole difference in price is not a clear gain to Railway Companies, because the value of the old iron is diminished in the same proportion; but the excessive price of iron and steel has been one considerable element of the recent increase in working expenses. The reduction in the price of coal will affect for the first time the expenditure of the current half-year, for nearly all the Companies had unavoidably bound themselves by contracts which have only now expired. The contracts which are now in force are probably founded on a reduction of not less than 50 per cent. The weekly expenditure of the large Companies on coals is so large that some of them will save from 2,000*l.* to 4,000*l.* per week by the diminution on prices. A saving of 3,000*l.* is equivalent to an increase of 6,000*l.* in the weekly traffic returns, because the gross receipts are subject to a deduction of 50 per cent. for working expenses. As the whole benefit of reduction in the price of coal will accrue in solvent Companies to the ordinary shareholders, they may reasonably expect for the next year an average increase of 1 per cent. in their dividends. Although it can scarcely be expected that the price of coal will revert to its former level, there is no reason to apprehend an early return of the dearth of 1873. The enormous profits made at that time by coalowners gave a strong

impulse to mining enterprise, and in many places preparations have been made for bringing the coal of the deeper seams for the first time into the market. The capital which has already been expended on new pits affords a guarantee that within two or three years the supply will be largely increased; and there is no reason for expecting a corresponding addition to the demand. Even if the iron trade resumes its former activity, the abnormal disturbance of the price of coal will probably not be repeated. The colliers, whose industry varies inversely with its remuneration, have everywhere submitted to a considerable reduction of wages, and consequently it may be hoped that their labour will once more become comparatively regular and efficient. Their efforts to stint the supply of coals by arbitrary rules of their own may perhaps continue to exercise a pernicious influence. Another cause of the late increase in working expenses remains for the present in full operation. The Railway Companies have hitherto made no attempt to reduce the wages of the men in their employment. It is possible that they may receive some compensation for increased expenditure in efficiency of service and in security against combinations for advance of wages. It is doubtful whether Mr. GLADSTONE's advice to his fellow-shareholders in the Metropolitan District Railway is not founded on too vague a generalization. Railway Companies have found by varied experience that the most profitable rates seldom coincide with either the highest or the lowest rates. Their best customers as passengers are the middle classes, who live in one place and conduct their business in another. Mr. GLADSTONE perhaps felt a delicacy as a shareholder in relieving the suburban railways from the monstrous injustice of a tax from which omnibuses and river steamboats are exempt.

In the case of some Companies the apparently large reduction of dividend is due to a change in financial arrangements, or in the mode of keeping the accounts. The balances carried on to the next half-year ought to be compared with the corresponding amounts in former years if it is desired to make a strictly accurate comparison. One or two Companies have but lately conformed to the law which prohibits the payment of interest out of capital on unproductive outlay. The restriction is in itself purely artificial, and it has been imposed, at Lord RUSSELL'S instance, with the express purpose of discouraging railway enterprise. Private capitalists would in the ordinary course of business charge all the costs of an improvement on the expected returns, nor is there any reason why shareholders in a joint-stock undertaking should be subjected to special disabilities. Unfortunately any member of a Company, acting perhaps in the interest of a hostile competitor, may enforce, by proceedings in equity, the strict observance of the law. The payment of interest out of revenue derived from the existing undertaking ultimately involves neither loss nor gain to the proprietors, although it often causes extreme and unreasonable inconvenience to those who are temporarily deprived of their income. Where the net revenue is, as in the case of the Manchester, Sheffield, and Lincolnshire Company, almost entirely absorbed by the interest on unproductive works, it is only by an elaborate calculation that it becomes possible to estimate the value of the whole undertaking. The Chairman of the Sheffield Company stated at the general meeting that, but for the operation of Lord RUSSELL'S rule, the dividend would have been at the rate of $4\frac{1}{2}$ instead of $\frac{1}{2}$ per cent. per annum. The Midland Company, which is better able to bear the burden, has to provide interest on a much larger capital invested in lines which at present yield no return. The Settle and Carlisle Railway, of which the completion has been unavoidably delayed, has cost between two or three millions, which will in two or three years produce an ample return. In the meantime the charge of 50,000*l.* a year on the receipts of the rest of the system evidently bears no nearer relation to the value of the productive lines than if it were the cost of a coal-pit or a cotton factory in which the profits of another industrial undertaking might have been invested. The numerous lines which are now in course of construction will create additional traffic for the owning Companies, but they will also, and to a greater extent, produce a diversion of existing traffic. By means of the Settle and Carlisle line the Midland Company will appropriate a large share of the Scotch West Coast traffic, which now exclusively belongs to the London and North-Western. The Midland, the Great Northern, and the Manchester and Sheffield have, by

their joint undertaking of the Cheshire lines, already begun to divide the Liverpool trade with the London and North-Western and the Lancashire and Yorkshire. The Great Northern and the London and North-Western have promoted competing lines from the North and South into Leicestershire, which had been the special preserve of the Midland; and the London and North-Western will have the free use of a line which the Great Northern is constructing side by side with the Midland line into the heart of the Derbyshire coal-field. The Midland Company has by the legislation of the present year obtained access to the coal-fields and ports of South Wales, of which the traffic had been hitherto divided between the London and North-Western and the Great Western. Whatever may be the advantages of competition to Railway Companies, there can be no doubt that it is universally desired by freighters and by trading communities. For some years past competing lines have been projected and authorized with unceasing activity, although some districts form an exception to the general practice. The three Companies which occupy the South-Eastern counties have lately concluded a three years' truce, and the North-Eastern Company reigns undisturbed over North Yorkshire, Durham, and Northumberland. An estimate of the prospects of a Railway Company requires almost as complicated a calculation as the determination of the movements of a planet. It is necessary to take into account not only the original velocity and the centripetal force, but the attraction which is exercised, in proportion to their mass and proximity, by all the other adjacent or competing bodies.

SEÑOR CASTELAR.

SEÑOR CASTELAR has after a long interval returned to active public life by delivering at Malaga a speech which probably loses the greater part of its value in an abridged English version. Although comparisons of the oratory of different countries and languages are but indefinite and conjectural, it is probable that, as a master of impassioned and ornate rhetoric, CASTELAR surpasses all contemporary rivals. A summary of the principal propositions of one of his speeches is as unsatisfactory as a description of a picture or a prose translation of a poem. Literary critics might fairly decline to exercise their judgment on the meagre skeleton of an artistic composition; but an orator who has overthrown and administered Governments becomes also amenable to political comment. A speech which has been received with enthusiastic applause illustrates the mental condition of the audience as well as the ability of their eloquent instructor. To an Englishman or an American accustomed to take elementary truisms for granted, it appears strange that it should be necessary in Spain to propound with didactic emphasis and fulness the simplest rudiments of political doctrine. That disorder and anarchy are incompatible with freedom is to the members of a settled and self-governing community, if not a self-evident truth, at least a part of established and undisputed tradition. It might have been supposed that Spaniards had learned by the practical experience of three or four generations that compulsory submission to force is the inevitable alternative of obedience to law. The elaborate despatch in which the FOREIGN MINISTER of Spain has lately proved that the Carlists are morally and logically in the wrong affords another illustration of the elementary nature of political controversy in Spain. In former years Señor CASTELAR taught his admiring disciples that laws and institutions of which they happened to disapprove were not sanctioned by any moral obligation. Republicans in Spain, as in France, refused to acknowledge the authority of majorities or of Governments when it clashed with the divine right of their favourite form of political organization. It is true that CASTELAR was always a sincere enthusiast, and not a selfish revolutionary disturber. An inveterate believer in fine phrases and benevolent sentiments, he selected as his teacher MAZZINI, who in his most exalted aspirations rejected the vulgarer forms of Socialism and the bloodthirsty designs of modern Jacobins. There was perhaps some excuse for preferring a Republican Utopia to the condition of Spain under the licentious Court of ISABELLA, or under the control of a long succession of military adventurers and intriguing Parliamentary rascals. CASTELAR and his friends resented the supremacy of the army before they had appreciated by practical ex-

perience the domination of the rabble. It is natural that a sanguine theorist roughly awakened from his illusions should desire to reconcile as far as possible his mature convictions with the remains of his former creed.

On some points the speech at Malaga may have sounded like a repudiation of Señor CASTELAR's earlier opinions, but the retraction was incidental and perhaps unconscious, while his main object was to assert and maintain his political consistency. One significant omission indeed may be accepted as a tacit confession of error. Federalism has perhaps finally disappeared from the Republican faith of which it had so oddly formed a part. The genuine Federalists of Spain, like the partisans of the Commune in France, desired to establish a cluster of petty Republics, in each of which clubs and demagogues should exercise absolute power untroubled by the interference of central Governments or of military force. The Spanish Federalists derived a colour for their doctrine from the historical fact that the monarchy had been formed by an amalgamation of petty kingdoms, and that it had absorbed and suppressed ancient municipal franchises. It would seem that CASTELAR and other well-meaning democrats supposed themselves to be Federalists only because the title had been appropriated by the extreme Republicans. As soon as the experiment of Federalism was tried after the abdication of King AMADO, it became impossible to tolerate the turbulence of Cadiz, Malaga, and Barcelona, or the traitorous secession of Carthagena. When a Republican Minister announced that he would never use force to coerce rebels who held his own political opinions, it became necessary to choose between the disruption of society and the abandonment of idle theories which now for the first time acquired a meaning. In his speech at Malaga Señor CASTELAR dwelt perhaps too long on his former determination to suppress at all hazards the ruinous insurrection of Carthagena. He abstained from reminding his hearers that the first step to the restoration of national unity was the suspension of the sittings of a factious Cortes, nominally returned by universal suffrage. Government by one person is not the most perfect type of a Republic, but it was for the time necessary, and therefore justifiable. When CASTELAR professed himself a Federalist he had not thought that he should have to contend with Federalism at Carthagena. There was retributive justice in the destiny which compelled him to leave to his successor the final suppression of the rebellion. The disorganization of the army which he had strenuously promoted alone prevented him from reducing the insurgents to submission in a few weeks, even if they had dared to rise against a Government which could dispose of a regular and efficient force. But for the prolonged resistance of Carthagena the Carlists would perhaps have failed to organize a formidable civil war.

The arguments by which CASTELAR proves that a democratic Republic is the only admissible form of government are of a figurative and windy nature. The discoveries of science, the progress of industry, the mutual dependence of man on man, with a score of other commonplaces, are, it seems, the mysterious agents which make of modern society an inevitable democracy. The enumeration of the reasons for a Republic is neither more nor less convincing than one of the Count of CHAMBORD's periodical demonstrations that the welfare of France depends on the restoration of the White Flag and of the ancient dynasty. The progress of industry in its later or earlier stages requires a government, whether it is called a Monarchy or a Republic, which is able and willing to protect property, and if possible to leave trade alone. In some countries, including the United States and Switzerland, order and freedom are tolerably well protected by magistrates and Legislatures elected for a time. In England the same objects are not less effectually attained under an hereditary Chief of the State. Those who doubt whether a Republican form of government is well suited to Spain have a difficulty in conducting the controversy with Republican bigots whose opinions are wholly independent of expediency and of fact. A politician who would think it absurd to propose that Switzerland should become a kingdom may fairly assume that his scepticism as to a French or Spanish Republic is not a mere superstition. There is no similar presumption in favour of an enthusiast who believes in the Republic as a Spanish bishop or an English convert believes in the infallibility of the Pope. Faith claims to move in a higher sphere than reason, and consequently they cannot readily be compared. All the conditions of liberty which are correctly expounded by Señor CASTELAR were as fully secured, as far as laws

and constitutions could operate, under AMADEO as in the singular Republic which is administered by SERRANO. When the multitude at Malaga was advised to render the Republic orderly and stable, and to treat Monarchy as unquiet and revolutionary, it may perhaps have occurred to any dispassionate politician who might accidentally be present that it would have been equally easy and equally instructive to invert the suggested conditions of good government. As the Count of CHAMBORD would say, all good Frenchmen know that the Monarchy of St. Louis is orderly and stable, while the Republic has hitherto been unquiet and revolutionary. If a Republic possesses the supernatural attributes which are ascribed to it by its devotees, it ought to secure, or at least to promote, the public virtues which are, as CASTELAR rightly holds, indispensable to its success.

Political prophets, whether Republican or Legitimist, are at a disadvantage as compared with the religious zealots whom they strongly resemble. DRYDEN'S milk-white hind, or the Romish Church, of which she was the symbol, was immortal and unchanged :—

Without spotted, innocent within,
She feared no danger, for she knew no sin.

The not less divine and immaculate Republic has, according to CASTELAR, incessant reason to fear danger, for "the first shot fired against order by a Republican would perhaps be the death wound of the Republic"; and "society placed between anarchy and dictatorship will always choose a dictator." A Church which seems, like that of Rome at the present time, to labour under adverse circumstances, may perhaps be nevertheless achieving an invisible triumph; but a Republic which is either suppressed or maintained in suspended vitality under MACMAHON or SERRANO can scarcely claim to be unchanged and immortal. No other political organization is in truth more sensitive or more perishable. A King or an Emperor who has suppressed resistance to his authority finds his prerogative strengthened and confirmed; but a Republic, or indeed a free government, finds it impossible to extend its full benefits to the rebels who assail its principle. The freest of all Governments is compelled from time to time to pass Coercion Acts for Ireland. After the close of the American Civil War the Southern States were for a time deprived of nearly all their constitutional rights. It is possible that when an orderly government is restored in Spain, it may bear the name of a Republic, but for a long time it must rest on force. The establishment of permanent Republics on the Continent of Europe is only made difficult because the most zealous Republicans are enemies of society. When a Republic was proclaimed in Spain in the spring of 1873, the extreme revolutionary faction at once seized for themselves the power which the more moderate professors of the same nominal faith had hoped to secure. When the nation recoiled in disgust from anarchy, CASTELAR made the Republic tolerable by administering it as an absolute monarchy; and his successors have continued the same provisional substitute for a regular form of government. That a system which was found intolerable on a six months' trial is indispensable, sacred, and perpetual, is a proposition which requires more than eloquent declamation to prove it.

DROUGHT IN ENGLAND.

WATER Companies and water rates have pretty well banished the old-fashioned notion that air and water were almost equally plentiful. If the progress of civilization continues to be as rapid and unsavoury as it has hitherto shown itself, even fresh air may come to be laid on at so much a quarter; but at present the difference between the supply of the two commodities is very marked. There are many parts of the country in which water is only to be had with difficulty, while pure water is not to be had at all. Several causes have contributed to this alarming result. Improved systems of drainage have dried up the wells and emptied the pools which used in many districts to serve as natural tanks. The soil which once was a sponge has been converted into a sieve. Instead of retaining the winter rains until they are slowly dried up by the summer's sun, it sends them on at once to the nearest watercourse. The rivers themselves suffer under this treatment. They overflow in wet seasons, and are almost empty after a long drought. Even if they were as full as ever, the quality of the water is such that an abundance of it would be only a

doubtful benefit. Modern drainage not only subtracts moisture, it adds solid matters of a highly mischievous kind. Sewage and the washings of manufactories are a very common but a very unsatisfactory drink. Wells in porous soils share the same disadvantage. The poison that finds its way into the earth passes through it too rapidly to lose its pernicious properties, and the springs that it contaminates make the best possible medium for communicating any infection with which it may be charged. Thus, of the three natural sources of drinking water, two, rivers and wells, are so foiled as to make them in many cases actively injurious to health, while the third, rain-water, is recklessly allowed to run to waste. We should expect in this state of things to hear of much suffering and much preventable disease; and what little information there is on the subject points in the same direction. Warning voices are raised from time to time of the inevitable famine of water that must follow upon the next prolonged drought. This summer we have heard of farmers being obliged to send their teams fifteen miles in search of water, and of children crying for thirst which their parents cannot relieve without going a long distance or paying money which they can ill spare. The reports of the inspections which are instituted by the Local Government Board on the occasion of the outbreak of any epidemic almost invariably return polluted water as one of the causes, if not the sole cause, of the disease. These are only chance examples which present themselves without being looked for, but it is easy to divine from them what would be the result of a detailed and systematic inquiry into the water supply. It is not every village that has a Correspondent of the *Times* living in it. There are many cases in which the causes of disease are all present without disease actually showing itself, and it is only in the latter event that any investigation is instituted. Probably there is hardly a village in England in which many of the wells are not poisoned, and in the drier parts of the country hardly a village in which, during some part at least of the year, water is not inconveniently scarce.

It needs no argument to show how formidable a state of things this is. It has been proved by experience that no vehicle of disease is so fatal as drinking-water. If water were always pure, cholera would be almost banished, and the risk of typhoid fever reduced by more than one-half. And though it is known what harm bad water can do in cases of infectious disease, no one can accurately estimate the extent to which other complaints come from the same cause, or how far its effects may be traced in a condition of general ill-health almost as mischievous in the long run as acute disease. The evils that follow from scarcity of water, though less obvious perhaps, are not less serious. Where there is a difficulty in getting water to drink there can be no question of washing, and when dirt is accepted as a permanent necessity, there must in a majority of cases be ill-health and loss of self-respect. Again, though there may be a difficulty in getting water to drink, there is never any difficulty in getting something else. The first requisite to sobriety is to have the means of satisfying thirst without going to the public-house. When water is scarce or bad it becomes a mockery to preach temperance. Men are prone enough to drink to excess when they have only their taste to please; what must be their temptation when they have a natural want to satisfy, and can only satisfy it by beer? All the efforts of philanthropists and moralists must be of little avail so long as dirt and drunkenness are unavoidable; and without abundance of water it is hard to see how either can be prevented. It would be difficult, therefore, to exaggerate the importance of this question of water supply as regards its personal aspect; and besides this, there is its agricultural aspect to be considered. Farmers who have to send their horses many miles for water are at an immense disadvantage as compared with farmers who have all they want close at hand. A horse can but do a certain amount of work in a day, and if for some hours he has to be thus employed, he cannot be employed in other and more profitable ways. Besides the waste of labour entailed by having to bring water from a distance, considerable injury to the more delicate crops and to stock is involved in not having a plentiful supply of it always ready. In very dry seasons many parts of England reproduce on a small scale some of the phenomena of a drought in India. There is no food for the cattle, and they have to be killed off and sold for what they will fetch to avoid the alternative of seeing them die and fetch nothing.

The question of water supply calls for much more careful attention than has yet been bestowed upon it. Some useful suggestions will no doubt be made by the Royal Commission on the pollution of rivers which has now brought its labours to an end. But rivers after all are only a small part of the whole subject. It is not merely the causes which lead to rivers being foul that need looking into; the causes which lead to their being empty have an equal claim on public attention. Again, but a small part of the drinking-water of the population is drawn from rivers. Wells and springs of all kinds are in this respect of even greater importance. The questions how far drainage has diminished the amount of water supplied through these channels, and how far it has affected the wholesomeness of what is supplied, have not been dealt with, though they must affect at least as many persons as the questions included in the Commissioners' instructions. If the two charges of deficiency and impurity can be made good against the water obtained from wells—and in many instances there is every reason to believe that they can be made good—there is the further question to be considered what sources of supply can be substituted for wells. One expedient is to extend the system at present in use in most towns to larger areas. There are still districts in which the supply of water is unfailing and enormously in excess of local requirements. Indeed it would be more accurate to say that no local requirements exist. From the lakes of Wales or Cumberland, or from reservoirs constructed among their mountains, water might be conducted to all parts of England. The expense of this system will probably stand in the way of its adoption except in the case of great cities, although under an improved system of local administration the force of this objection might be lessened. A less ambitious design might embrace the storage and utilization of the surplus waters of each district. Even in places where water is scarcest it may often be running to waste a few miles off. The evil of modern drainage is that it carries water too quickly into the nearest river and thence into the sea, and, if the current could be intercepted, reservoirs might gain what wells lose. The simplest and perhaps the most effectual expedient of all would be the storage of rain-water. In this climate the winter rains might furnish water enough for the whole year if they could only be laid up till they were wanted, and there is nothing in the problem how to do this that would be beyond the skill of a competent civil engineer. But before any of these remedies can be applied on a scale sufficient to meet the need, the extent and character of the existing water supply must be accurately known. It is not defective everywhere or impure everywhere. In some places it is both; in others it is on the eve of becoming both; in others it is perfectly satisfactory; in others nothing but a little rearrangement is wanted to make it so. The local Government Board may have the means of arriving at this knowledge through their own officers, and when once it has been obtained, they can call in the best engineering authorities to determine what measures must be taken to ensure an adequate supply of wholesome water in every part of the country. If the inquiry is too extensive to be undertaken by a Government department which already has its hands full, the proper instrument for the purpose would be a Royal Commission. The Commissioners who have lately been investigating the kindred subject of the pollution of rivers might have their powers renewed and extended for this purpose.

EDUCATIONAL COMPROMISES.

IN the last of the chapters on Compromise which Mr. JOHN MORLEY has been writing in the *Fortnightly Review*, the Education Act of 1870 is quoted as an example of what compromise ought not to be. It was not only, says Mr. MORLEY, a small reform, but it was a small reform made on lines and in a direction antagonistic to those of the great reform which must ultimately follow it. "It was clearly agreed among the Government and the whole of the party at their backs that at some time or other, near or remote, if public instruction was to be made genuinely effective, the private, voluntary, or denominational system would have to be replaced by a national system. To prepare for this ultimate replacement was one of the points to be most steadily borne in mind, however slowly, and tentatively the process might be conducted. Instead of that, the author of the Act de-

liberately introduced provisions for extending and "strengthening the very system which will have eventually to be superseded." It is something to get hold of a charge against the Act which really goes to the bottom of the matter. There is no doubt whatever that the effect of the provision about new building grants was what Mr. MORLEY describes it to be, a deliberate extension and strengthening of the voluntary system. It may also be admitted that the introduction of a national system was the introduction of a power which will probably some day absorb the voluntary system. But, though we may accept Mr. MORLEY's account of the facts, we cannot accept what he considers to be the identical statement, that by this small reform the author of the Act made the future great reform the more difficult of achievement. On the contrary, we hold that the manner in which the introduction of a national system was combined with the extension of the voluntary system, which it may very likely one day replace, will make this eventual replacement easier, while it tends to raise the standard of education in the interval. As regards the first position, it must be borne in mind that the provision about building grants did to a very great degree disarm the advocates of voluntary schools. Mr. FORSTER had declared that he had no enmity to voluntary schools, but it is doubtful how far he would have been believed if he had not given this indisputable proof of his good will towards them. It may be objected that it was not necessary to disarm the supporters of voluntary schools, since the Government majority was large enough to carry the Education Bill against any amount of Conservative opposition. This view underrates the number of allies which on this question the Conservative Opposition would have found on the Liberal benches. The supporters of voluntary schools in the House of Commons were not all opponents of the Government. Many of them were men who habitually voted with the Government; and if they had for once voted against the Government, the Liberal majority might have dwindled away to nothing. But, setting this aside, the successful working of the Bill depended in a great degree upon the temper in which it was received in the country. If the supporters of voluntary schools had everywhere opposed the formation of School Boards, and had refused to be elected on them where their formation was inevitable, a great deal of educational energy and educational experience would have been lost to the national system. The School Boards, instead of being worked in accord with the voluntarists, would generally have been animated by active hatred of them. The influence of this feeling would have been seen in their educational policy; and, since the moderate element in the constituencies would have been in a great measure unrepresented, owing to the refusal of voluntarists to offer themselves as candidates, there would probably have been a good many reproductions of the Birmingham School Board. Under these circumstances the Conservative reaction would have been as conspicuous in the region of elementary education as it has been with regard to Endowed Schools. The first Bill introduced by the new Ministry would have been a Bill to modify the Act of 1870, and if the time between 1870 and 1874 had been spent in fierce contests between the advocates of School Boards and the advocates of voluntary schools, it is probable that the legislation of the present Session would have placed the former in a far more disadvantageous position than that which they hold under the Act.

It may be objected that the voluntarists might have been propitiated by a smaller concession than the liberty to build new schools with public money for a specified time. The answer to this is found in the fact that this particular concession has another merit, that of improving the standard of elementary education for the present. As yet we have hardly made acquaintance with the kind of schools that will be maintained by School Boards which have been formed against the will of the ratepayers, and whose members represent for the most part a dogged conviction that children are better without education than with it. School Boards of this type will soon be common throughout the country. Not a week passes that orders for their compulsory formation do not go out from the Education Department. The parishes to which these orders apply have usually had no mind to supply their educational deficiencies. If they had any desire to do so they would have formed a School Board as soon as their want of school accommodation was communicated to them, and not waited till they were forced to form them. A School Board elected under the influence of this temper is

not likely to display any zeal in the cause of education. By and by, as the parents come to feel interested in their children's advancement, things may be different, but as yet the question is likely to be treated simply as it affects the rates. The main object which the School Board will propose to itself will be to spend as little money as possible. A national school conducted on this principle will be inferior as an educational instrument to a voluntary school which has been founded perhaps to keep out a School Board, and which will be constantly in fear of having one created if the educational wants of the parish are not properly supplied. In a great many districts the choice lay between putting the school into the hands of the parson or into the hands of the farmer. The result of the extension of the time within which building grants could be applied for was no doubt in many cases to put the school into the hands of the parson; but we believe that for some years to come the interests of education will be better served by this course than by the opposite one. A good voluntary school is better than a bad school which calls itself national; and if Mr. FORSTER sacrificed consistency by increasing the number of voluntary schools at the same time that he was providing for the creation of other schools wherever voluntary schools were wanting, he sacrificed it in the interests of the children who have to be instructed.

Nor do we admit that in taking this course Mr. FORSTER can be fairly charged with forgetting that at some time or other the voluntary system will in all probability have to be replaced by a national system. That replacement will only be effected with the good will of the voluntary schools, and the less enmity there is between the friends of the two systems at starting the more likely will the voluntarists be to make over their schools to the public authorities. When once a national system is set on foot—and it is set on foot in principle as soon as the State undertakes to supply all deficiencies that may be detected in the provision of voluntary schools—the managers of every voluntary school will know that when they give secular instruction to the children, they give at considerable cost to themselves what the State would give equally well if the voluntary school were closed. This is a reflection which, as the flames of controversy die away, must naturally affect in a highly unfavourable manner the zeal and liberality of the supporters of voluntary schools. It is one thing to spend time and money in having children taught to read, write, and cipher when without this expenditure they would not be taught at all, and it is another thing to spend time and money for this purpose when without this expenditure the children would be taught equally well at the cost of the community. For some time to come no doubt the supporters of voluntary schools will assure themselves that children can only be taught religion by the same person who gives them secular instruction. But this assurance will at last be sapped by the discovery that other voluntary schools have been made over to School Boards on terms which allow of the children getting as much and as good religious instruction in other ways. When this discovery has once been made, the clergy will wonder that they could ever have burdened themselves with the provision of secular instruction when it was so much easier to leave that to be provided by some one else and to concern themselves solely with the provision of religious instruction. The building of new voluntary schools therefore was only the building of schools which are destined, if this anticipation proves correct, to become national schools at some future time, not by virtue of a triumph of one system over another, but by the gradual withdrawal of the voluntarists from a work in which they will have ceased to take any special interest. The replacement of the voluntary system by a national system would not have been really forwarded by a measure which made it a point of honour with the supporters of voluntary schools to carry on their present rivalry with School Boards, and any less conciliatory Act than that of 1870 would probably have had this effect.

WEAK POINTS IN COMPETITIVE EXAMINATION.

THE current number of *Macmillan's Magazine* contains a contribution to a very important controversy which may be worth notice. Mr. Scoones has written a paper upon the mode of appointment to the Civil Service of India, at the invitation, as he tells us, and "under cover of the moral support of some Headmasters of leading public schools." The paper is moderate and

sensible, and is founded upon a very intimate knowledge of the facts. If we were disposed to be critical, we might complain that we are here and there left rather in the dark as to the precise drift of Mr. Scoones's argument; but we must not be too hard upon a specimen of English composition which is patronized by the Headmasters of public schools. His general meaning is abundantly plain; and he makes a very definite proposal on which we shall presently offer a few remarks.

The first part, however, of the paper is occupied with an attack upon certain details in the existing arrangements; and we take Mr. Scoones to infer that the alteration of these details would remove the most serious objections to the competitive system. He complains, for example, of the well-meant device by which a certain number of marks is deducted from the total in every subject. The purpose of this regulation was of course to hinder candidates from attacking a large number of subjects in the hope that even a smattering of information upon each would catch a few marks. Mr. Scoones says that the system works very unfairly. If, for example, a candidate gains 625—that is, half—marks out of the 1,250 assigned to mathematics, 125 marks are deducted from his total, and he therefore counts 500 marks. If he gets half the marks, or 187, in each of three modern languages in each of which the full marks would be 375, 125 marks are deducted from his score in each of the three. Thus 375 has to be deducted from his total of 561 marks, or he counts only 186. Therefore, says Mr. Scoones, if we assume that a fair knowledge of the language, literature, and history of the three countries should be equivalent to a fair knowledge of mathematics, a gross injustice is done. The total marks apparently assigned in the one case are 1,250, and in the other 1,135; and yet of two candidates who get half marks in each, one is allowed 500 and the other only 186. We find it very difficult to judge of this argument. In the first place, we really cannot say whether a knowledge of three languages ought, or ought not, to be equal to a knowledge of mathematics; in the next place, we cannot say whether it is as easy to get half marks in the mathematical examination as to get half marks in the literary examination; and, further, we do not see why any wrong could not be remedied by altering the total marks assigned as easily as by altering the system of deduction. It is surely a fallacy to argue that the value of two different departments of knowledge is assumed to be equal because the total marks assigned to them are approximately equal, and then to show that the system of marking, when rightly understood, proves that the examiners do not value the two kinds of knowledge equally. The candidates know the conditions beforehand; and all that clearly results is, that knowledge spread over three subjects pays less than knowledge concentrated upon one. This was precisely the object of the regulations. Mr. Scoones, however, tells us that for some reason, which he does not explain, the object has not been secured. As a matter of fact, candidates scatter their efforts very widely; and, for example, only 53 out of 1,170 candidates in five years confined themselves to two branches of knowledge. As Mr. Scoones does not help us to understand this result, we shall not attempt any conjecture for ourselves. In fact, it would be impossible here to go into the minute considerations which would be necessary for judging of the working of the plan, and which require for their appreciation an intimate knowledge of the facts.

Mr. Scoones's opinion doubtless deserves attention; but we must leave the discussion to experts, with a single remark. The plan of deducting marks is certainly a rough and mechanical expedient. It is an attempt to lay down a hard and fast line to force examiners to do their duty. A skilful examiner could sufficiently discourage superficial knowledge without any such self-acting apparatus. An examiner may, if he chooses, set a paper in mathematics which should prevent a senior wrangler from getting twice as many marks as the "wooden spoon," or should enable him to get a thousand or ten thousand times as many. The scale by which men's talents are measured may be so arranged as to separate the best candidates as widely as possible from the worst, or so as to distinguish most accurately between the bad and the very bad, and give only a slight advantage to the really good. Different systems may be useful in different cases; but in any case questions may be asked in such a way as entirely to neutralize or greatly to intensify the effect of the deduction system. It is therefore much more important to know how the examiners discharge their duties in practice than to know what are the official rules. And we are sorry to see that Mr. Scoones makes the very serious complaint against most of the examiners that their standard is altogether fluctuating and arbitrary. In one year we are told that only one candidate got over 500 marks in mathematics, only 3 over 400, and 14 over 250; whilst 37 did not qualify. In the next year 15 got over 500, 26 over 400, 44 over 250, and only 15 did not qualify. We can easily understand that such fluctuations, which must be due to variations in the examiners rather than in the merit of the candidates, must make the whole system uncertain; and Mr. Scoones gives some striking instances to show how poor candidates have been seduced into taking up some study by the leniency of the examiners of one year, and found that their labours were entirely misguided owing to the severity of their successors in the next. The great virtue of an examination is an approach to fixity in the standard of merit; and Mr. Scoones has certainly shown cause for complaining of some of the results hitherto obtained. Incidentally, too, he gives a rather unpleasant picture of the system generally. Admitting the force of his protest against the sweeping accusations against crammers, we cannot say that his revelations suggest that

they would in any case supply a very healthy system of education. It is "quite intolerable," he says, to listen to the "ever-recurring question," "Do you think such and such a subject will pay this year?" His moral is apparently that there should be more certainty as to what will pay. We should be inclined to add that an education which consists entirely in devoting years of labour to studying subjects which "pay," irrespectively of any more intelligent motive, is a radically bad one. Even if the standard were made as invariable as possible, a young man who works for four or five of the most precious years of his life exclusively with a view to getting marks, and whose teacher encourages him to work exclusively for results, is under a very unhealthy intellectual stimulus, though the name of "exam" may imply a distorted view of its evils. However skilfully the examination test may be manipulated, it is always liable to this grave objection of narrowing and lowering the whole aim of education; and though it may be difficult to suggest any practicable alternative, we are not surprised that such a system of appointment leads to very serious evils.

Mr. Scoones recognizes such evils, and has a plan for meeting them practically. He admits that there are other qualities besides more skill in passing examinations which should fit a man for taking part in the government of a great empire. He proposes, therefore, a scheme which should allow of their being tested. Instead of selecting the candidates absolutely by the result of the examination, he would take the 65 or 70 best candidates for the 40 annual vacancies. These probationers should be brought together in a college for a year. At that time a competent staff of adjudicators should select the 40 most suitable for final appointment, and give some rewards, such as appointments to the Engineering College, to three-fourths of the remainder. The plan is, of course, a very rough one, and Mr. Scoones admits the difficulty of forming a satisfactory board of judges. Supposing that these difficulties can be surmounted, we agree that the plan recognizes one great evil of the present system. It was doubtless a mistake to abolish Haileybury. The system of open competition might have been applied as freely if the entrance to Haileybury had been thrown open as by the present arrangement. As it is, young men are left for two years after their first examination to pick up knowledge as they please, subject only to their being continually harassed by examinations. The advantage of bringing them together under a tolerable system of training, and encouraging that *esprit de corps* which is naturally stimulated amongst fellow-students, is generally admitted now that it has been lost. But when we have admitted that Mr. Scoones's plan recognizes these considerations, we must add that it seems to be very doubtful in some other respects. The main objection is abundantly obvious, and is tacitly recognized by Mr. Scoones. On the present plan, a successful candidate has at least gained a certain appointment. On Mr. Scoones's plan he would only gain the chance of receiving an appointment. He would become a probationer, and the chances of his being finally successful would be only as 4 to 3 or 2½. It is plain that this would very much diminish the attractions of the appointments. The youth who had become a probationer and failed of final success would have suffered a positive injury. Till the age of perhaps two or three-and-twenty he would have been preparing himself for a special profession, and would then be turned loose upon the world with much of his labour thrown away. At present a candidate who fails in his examination has plenty of time to take to something else. Under the proposed plan the time spent at the college would be to a great extent wasted for any other purpose; and a year sounds a long time to a young man, as it gives a distinct start to his contemporaries who have pursued the direct course through the Universities to other professions. So far, therefore, as the plan is effective it will clearly tend to frighten away some of the youths who are now attracted; nor do we suppose that by substituting for some of the successful candidates a selection from the twenty or thirty below them on the list any great improvement would be made in the material. Mr. Scoones, as we have said, seems to recognize this difficulty, and he meets it in two ways. He limits the residence in the proposed college to a year, which we fear would decidedly injure its efficiency, both because the time for special study would be short, and because a college in which each year is entirely distinct from its successors and predecessors would have but a faint corporate vitality. And he proposes to give some sort of consolation prizes to most of the unsuccessful. This last scheme would, of course, soften the blow; but we doubt whether it would be very agreeable. The youth whose ambition pointed to the Civil Service would very probably not care to become an Engineer, and perhaps the Engineers would not welcome the addition to their ranks of the failures of the Civil Service. Without going into details, however, the proposal strikes us more as a recognition of a weak point in the scheme than as offering an efficient remedy. Like other compromises between two principles, this attempt to reconcile the scheme of appointment by competitive examination and appointment by skilled and impartial judges is more ingenious than satisfactory. Still it may suggest a ground for future discussion, and stimulate the increasing conviction that we have not as yet hit upon an ideally perfect arrangement.

DEVIZES.

THE name of the town of Devizes at once strikes the ear as something which does not readily fall under any of the classes into which English place-names commonly fall. It is not a Roman

or British name which has lived through the English Conquest. Nor is it an English name either describing the place or preserving the memory of a tribe or of an early owner. Nor yet is it, like Beaulieu and Richmond, a name palpably French, witnessing to the days when Norman and other foreign settlers had made French the polite speech of the land. The name is Latin without being Roman. For once the Latin name is not made from the English, but the English from the Latin. The castle "ad Divises" has become Devizes, or rather "the Devizes." The article was used as late as Clarendon and, we fancy, much later; the popular local name of the place is "the Vizo." It is plainly called from a boundary or division of some kind, but what boundary or division is not at first sight very clear. It must be remembered that the name "Divise" is not found till the foundation of the castle by Bishop Roger of Salisbury in the time of Henry the First, of which more anon. The town is one of the same class as Richmond, one which has arisen around a castle of comparatively late foundation. Why then did Bishop Roger give his fortress so odd a name? Dr. Guest points out that the town of Devizes overlooks the Avon valley, that it stands just on the border of that narrow slip of territory which the Britons kept after the victories of Ceawlin up to the battle of Bradford in 652. He holds that the march district was called "Divise," and that the castle took its name from the district. He refers to the town of Mere in the same county, a good deal south-west of Devizes, where the name, an English equivalent, as he remarks, of Divise, is clearly derived from the border position of the place. It is very seldom, and always with great diffidence, that we set up our judgment against that of Dr. Guest, but this is a case in which we are strongly tempted to do so. Mere is an English word, and the name may be as old as the first English occupation of the district. Divise is a Latin word, and Dr. Guest does not bring any instance of the name being used before Bishop Roger's time. It would certainly be strange if a district had, for five hundred years, kept a Latin name of which no trace can be found. It certainly seems to us more likely that the "divisa" from which the castle took its name were some smaller local boundary, and we believe that local antiquaries are ready with more than one explanation of this kind. And as for the oddness of the name, it must be remembered that it is not a name which arises from any settlement or tradition, but from the fancy of one man. In such cases eccentric names have often been given in all ages.

Another question may arise whether the place had any being at all before the foundation of the famous castle. Most of the great Norman castles were reared on earlier sites; the mound and the ditch, as we have been taught by Mr. Clark, are for the most part English works—works most commonly of Edward the Elder or of his sister the Lady of the Mercians. But their works are placed along the line of defence against the Danes, and they are found in places which bear intelligible names, whether of English or earlier origin. One hardly sees why they should fortify a post in the heart of Wessex, and, if they did, the place would bear some name, and it is not likely that that name would be Divise. But, whether the earthworks belong to an earlier time or not, it is certain that the vast fosse, the mighty mound which the unseen railway now passes under, was first crowned by a castle in the later sense by Bishop Roger. Certainly no place brings more strongly home to us the temporal position of a Bishop in those days. The episcopal castle and the episcopal palace are two very different things. The palace, in strictness of speech, is the Bishop's dwelling in the episcopal city. It is only a piece of modern affectation which, since both the English Metropolitans have forsaken their natural homes, speaks of the manors of Lambeth and Bishoptorpe as palaces. The episcopal palace, hard by the episcopal church, sometimes actually joining it, is for the most part in strictness a house. Standing, in many cases, within a walled town, it needed no great amount of defence, and even when, as at Wells, some degree of fortification was needed, it was plainly no more than was needed for protection in case of danger. Castles in the strict sense in the episcopal city, castles like those of Durham and Llandaff, are quite exceptional, though they may be easily explained by the circumstances and history of the places where they are found. At Durham Bishop Walcher was placed by William as both temporal and spiritual ruler among a fierce and half-conquered people, who had slain two former earls, and who were in the end to slay the Bishop himself. It is not wonderful that he was placed in a fortress even within the episcopal city. At Llandaff a Bishop placed among the turbulent Welsh, and whose city was a more unwall'd village, needed a fortress no less than his more princely brother of Durham. Wolvesey, the castle of the Bishops of Winchester, not actually within the city, but just outside of it, was more remarkable and unusual. But in episcopal dwellings away from the cities, the castle is, in the days with which we are dealing, the rule. The Bishop of the first century or so after the Norman Conquest, turned by the Norman polity into a military tenant of the Crown, dwelling commonly as a stranger among strange and often hostile people, raised most likely to his see as the reward of temporal services to the Crown, as soon as he got away from the episcopal city and its more peaceful associations, as soon as he found himself on his rural estates, began to feel like any other baron on his rural estates. He raised for himself, not a house, not a palace, but a castle in the strictest sense; a fortress not merely capable of defence in case of any sudden attack, but capable of being made a centre of military operations in case the Bishop should take a fancy, in times of civil strife, to make war upon some other baron

or upon the King himself. And Roger of Salisbury was not likely to be behind his brethren in this matter. The poor clerk who had taken the fancy of the Ætheling Henry by the speed with which he gabbled over the service in his lowly church in a suburb of Caen, and who was thereon declared to be the fittest of all chaplains for soldiers, had risen with the fortunes of his patron, and, as the chief minister of the Lion of Justice, he was the most powerful man in the realm. Architecture, both military and ecclesiastical, was a special taste of his, and it would seem from the description of his works given by William of Malmesbury that the later form of the Norman style, the form where a finer masonry and more elaborate kind of ornament came into use, was in some measure his creation. As Bishop of Salisbury—that is, not of the new Salisbury in the plain, but of that elder Salisbury where the city itself was the mightiest of fortresses, but where the Bishop was not the sole lord of the city—Roger was not unnaturally stirred up to the raising of fortresses on the episcopal estates which might be wholly his own. At Malmesbury he gave great offence to the monks by building a castle within the very precincts of their monastery. At Sherborne, the town which his last predecessor but one, the Lotharingian Hermann, had forsaken for the old British hill-fort, he built another castle; but, unlike Malmesbury, quite distinct, and at some distance from the minster. But his great work was at the Devises; the huge earthwork, whether he threw it up himself or found it there already, was crowned with a castle which was said not to be surpassed by any castle in Europe. Its fragments show that it must have been an example of a rich form of the style of which its founder was such a master, a form intermediate between the stern simplicity of the days of the Conqueror and the lavish gorgeousness of the days of Henry the Second. But unluckily all that is now to be seen consists of mere fragments here and there, fragments for the most part built up again as meaningless ornaments in the midst of the most fearful piece of modern ginnerack that human eyes ever beheld. But the mound and the ditch at least are there. It would need more than another Roger to get rid of them, and we can without much difficulty call up before our eyes that remarkable episode in the most troubled time of our history of which the castle of the Devises was the scene.

The sudden imprisonment of Bishop Roger by command of Stephen seems to have been the turning point of his reign. It at once set the clergy against him, and it seems besides this to have awakened general wonder as something so unlike the general character of the King. He who was held to be, in the words of the Chroniclers, a "mild man and soft and good, and who did no injustice," suddenly turns about, and, without any very clear reason, seizes in the most ignominious way on two of the chief men both in Church and State. People were struck both with the act in itself and with its strangeness in a man like Stephen, who, whatever were his faults, is not at any other time charged with cruelty, or even with lack of generosity, in his own person. But the moral difficulty is perhaps not very great. A man like Stephen, mild and gentle rather from temper than from principle, would, if he were once stirred up to what he was told to be an act of energy, be most likely to overdo matters, and to be energetic at the wrong time and in the wrong way. Anyhow, here was the great Bishop Roger, the most powerful man in England, the minister of the late King, suddenly seized along with his nephew Alexander, Bishop of Lincoln, and his avowed son Roger the King's Chancellor, during the sitting of a great Council at Oxford, and threatened with all manner of threats, unless all the castles and their possessions were surrendered to the King. But our concern is only with the one castle which was Roger's great work. Another nephew, Richard Bishop of Ely, managed to escape to his uncle's fortress, "ad Divisas fortissimum oppidum," where the chief tower ("principalis munitio") was held by the younger Roger's mother, Matilda of Ramsbury, who was likely enough the Bishop of Salisbury's unacknowledged wife. The King comes before the castle, on the site doubtless of the present approach from the town, swearing in his wrath that the younger Roger shall be hanged and the elder kept without food unless the castle is at once surrendered. Another version indeed makes it a voluntary offer on the part of the Bishop of Salisbury, in the hope of making his nephew yield, that he will not eat or drink till the castle is given up. In either case we have the picture of the mild Stephen suddenly turned as fierce as William Rufus, with his three prisoners, the two Bishops and the Chancellor, the Bishops just released, it would seem, from their wretched imprisonment, one in an ox's stall, the other in some miserable shed not otherwise defined. There is the great Bishop Roger, suddenly fallen from his pomp and power, standing faint and hungry before the walls, allowed to make the attempt by the sad sight and by his sad words to move his obstinate nephew the Bishop of Ely to surrender, if only to save the life of his uncle. We see the pair on the walls, the Bishop of Ely unmoved by his uncle's pleading and ready to let him or anybody else starve rather than give up the stronghold within which he has found shelter. Then the King is moved to further wrath; a gibbet is set up, the Chancellor is to be hanged at once. But his mother holds the strongest tower, her heart is moved for her son, if the Bishop's heart is not moved for his uncle; she will give up anything for her child. The great tower is at once surrendered, and after that the resistance of the Bishop of Ely and his followers is all in vain. We read the story, we go to the spot, and try to call up the scene. If the castle stood there untouched, it would be easy; if nothing stood there at all, it would not be very hard; but when the castle of Bishop Roger is turned into a grotesque modern mockery, what is to be done?

Some comfort, however, may be drawn from a visit to the two churches of the town. They have not fared worse than churches commonly do in the space of seven hundred years. They have at least not been deliberately and of malice aforethought turned into shams. There are not many towns in England which still keep two vaulted Norman choirs, one of which is not unlikely to be the work of Roger himself.

MEDIEVAL PROJECTORS.

WHEN Chaucer's pilgrims had reached the old village of Broughton under the Forest of Blean, within six miles of Canterbury, and about a mile to the south of the present high road, they were overtaken by a man clothed in black with a white surplice underneath, his cloak sewed to his hood, his hat fastened by a lace hanging down his back, and a saddle-bag, which contained his scanty clothing, thrown across the crupper. After long looking, Chaucer perceived that he was a Canon accompanied by his Yeoman, or servant. In the morning they had seen the company ride forth from their inn, and had spurred forward to overtake them. The dapple grey horse of the master sweated so that it was wonderful to see; while the servant's, flecked with foam like a pyc, was well nigh foundered. The Yeoman, full of courtesy, fell into conversation with Harry Bailly, the host and guide of the pilgrims, and began to praise the Canon his master, saying that, homely as he rode among them, he was a passing man, and could, if he would, pave all the way to Canterbury with silver and gold. "Bless us!" said the host, "if he be a man of such worship, why does he care so little for his dignity as to ride in those dirty, ragged old overalls not worth a mite; if he can buy better cloth, why goes he so sluttish?" "Well," replied the Yeoman, "it fares with my lord as with other men of over-great wit—he misuses it." In answer to further questions he went on to confess that, master and man, they dwelt together among thieves in holes and corners, for ever poring over the fire to multiply gold, always hoping and always failing, groping after the science which fled far before them and would, at last, lure them on to beggary. The Canon, suspecting that his servant was speaking of him, drew nigh and bade him hold his peace, for he was discovering what should remain hidden. The host encouraged the Yeoman to tell on, and not care for his master's threats. "I care for them but little," said he, and when the Canon saw that all his secrets would be disclosed, he fled away for very shame; and the Yeoman proceeded to lay open the lives of two professors of alchemy—one, his master, who duped himself as well as his neighbours, the other, a false Judas of a Canon, who was a mere cheat.

The introduction of the Canon's Yeoman, when several of the pilgrims had not yet told their tales, seemed so extraordinary to Tyrrwhitt that he supposed some sudden resentment had moved Chaucer to break the order of his work in order to insert a satire against alchemists. If it were so, it was a lucky accident; but was it not rather one of the purposed interruptions, and the happiest of them all, by which he has given reality and life to the journey? The earnest protestation that his master was not the treacherous Judas for whose cursedness the Yeoman would have blushed if everlasting blowing of a hot fire and the fume of mercury had not consumed his redness, the unmeasured invective which breaks forth throughout the tale, and the fear lest it should be taken as directed against all professors of alchemy, indicate that Chaucer was not unacquainted with alchemists, and was full of bitterness against some one of them. However that may be, the prologue and the tale prove the strong sense which preserved him from the delusion of the philosophers of his time, and of times long after him, and how well he understood the character of a class of men—the projectors—whom Dean Swift feared, hated, and ridiculed. Tyrrwhitt has mentioned two instances of the general belief, in that age, of the art of transmuting metals. The rose nobles of Edward III. in the year 1343 were supposed to have been coined from gold made by Raymond Lully in the Tower, and in the year 1404 it became felony, by statute, to multiply gold or silver. As late as the year 1618, Sir Giles Mompesson, Massinger's Sir Giles Overreach, and Francis Michel, a poor, sneaking justice of Clerkenwell, the Justice Greedy of the *New Way to Pay Old Debts*, had found out a new "alchymistical" way to make gold and silver lace with copper. They sued for a patent which Lord Bacon, then Chancellor, the Lord Chief Justice of England, and the Attorney-General certified to be fit and convenient, and that it would redound to the King's profit at least 10,000*l.* a year. In the space of nearly one hundred years, excepting a Latin translation of two books of *Troilus and Criseide*, three of the *Canterbury Tales* were the only works of Chaucer published. Of these the "Canon's Yeoman's Tale," printed in 1652, was one, and may have borne its part, with Ben Jonson's admirable comedy, in dispelling the illusions of the students of alchemy, and turning men from the alchymistical way of making gold and silver out of copper.

A more remarkable instance of the prevalent belief in alchemy in the fourteenth century is to be found in Rymer. In the year 1329 Edward III. sent writs to the sheriffs stating that John le Rous and Master William de Dalby, by the art of alchemy, knew how to make, and had made, and were making silver; and because by making that metal, if really it could be made, much profit might come to the King and to the kingdom, Thomas Cary had been appointed to bring them up safely to the King, together with the instruments used in their art, conducting them honourably if they would come; if not, using force. Gower believed in alchemy, or, as he calls it, "aleconomie." He had no faith in modern pro-

fessors of the art, and exhorted them to renounce it as sure to bring ruin upon them; but that the science in itself was true he affirmed confidently:—

To get a pounce thei spenden five,
I not how such a craft shall thrive.
In the maner as it is used
It were better he refused
Than for to worchen upon wene,
In thynghe which stant not as thei wene;
But not for thy who that it knewe,
The science of hymselfe is trewe.

And he goes on to say that the elixir was grounded upon nature, but modern alchemists could not discover it by reason of their ignorance. Chaucer had no such faith in the truth of the science. After telling with much humour, by the mouth of the Yeoman, the doctrine of the alchemists and their practice—how they blew the fire until their hearts fainted, and inhaled the fumes of quicksilver until they were of the hue of lead; the sordid misery, the threadbare array, the ill savour, infecting the passenger a mile off, of the sincere professors; their hope for ever deferred, and the madness which impelled them to waste on that cursed craft all their goods to the last sheet and mantle—he proceeds to describe a Judas among canons, an unbeliever who pretended to be sincere in order to cozen his fellows. He entreats those who use the art to renounce it before they purchase the curses of the folk whom they beguile. Then, still in the character of the Yeoman, he ends, not by confessing that the science in itself is true, but, ascribing to Aristotle and Plato the lore of the middle ages, he tells with grave irony how the philosophers had explained the mysterious by darker mystery, and, fencing with plain questions by one evasion after another, had finished with a protest that they were forbidden by the highest authority to reveal the secret; wherefore, concludes the Yeoman, since they may not tell how the stone may be discovered, I counsel that it is for the best to let it go:—

Thus, thus conclude I, sin that God of heaven
Ne wol not that the philosophes seven
How that a man shal come unto this ston,
I rede as for the best to let it gon.

The same sound common sense taught Chaucer to reject astrology. In his treatise on the Astrolabe, in which he has shown himself a master in science, he writes:—"The Ascendent sothly is as well in all nativites, as in questions, and as in elections oftymes is a thynghe, whych that these Astrologiens greatly observen." "Nathelless these bene observances of Judiciali mater and rytes of paynymis in which my spirite hath no faythe ne knowynge of hir horuscopum." In the Franklin's tale again he speaks of astrology with utter contempt:—

Which book spake much of operations
Touching the eight and twenty mansions
That longen to the Mene, and swiche folie
As in our dayes n'is not worth a fle

To make illusion
By swiche an apparence or joglerie,
(I can no termes of Astrologie)

To make his jupes and his wretchednesse
Of swiche a superstitious cursednesse.

Not less admirable in their kind than the common sense which preserved him from the illusions of his day were the rare insight and power of expression which enabled him so thoroughly to distinguish and so perfectly to portray the two Canons, the impostor and the frantic projector—the latter perhaps the more dangerous of the two. The excellence of Ben Jonson's *Alchemist* lies in the display of various modes of covetousness, in the sensualist, the zealot, and the grovelling, greedy, credulous trader. The professor of the occult sciences Subtle, and the yeoman Face, are, like the false Canon, cheats. Our Yeoman's master was of another mould—a projector, an earnest believer, a bigot to alchemy, of iron will, laborious, patient, enduring, and disheartened by no failure. The impossible project with which his brain teemed had brought him to rags, and he was fain to look abroad for means to work out the splendid success of which he never doubted. Had he been an ill-natured projector he would have despised and hated the dolts whom, to use the Yeoman's words, he made as great fools as the wisest—despised them because they could not comprehend his great scheme, nor altogether dispel a shade of doubt in its verity; hated them because they yielded their substance grudgingly, with conditions for sharing the fruit of the intellectual power by which, in his own esteem, he was exalted immeasurably above them. The Yeoman's master was good-natured. He was wanting, as regarded his neighbour, in nothing but morality. If those whom he had well nigh drained of their substance grew slack to supply his need, as beggary stared them in the face, he cozened them with a good intent. He would not have them, for the sake of the small pittance left, cast away the sure and inestimable benefit of the stone; therefore he sought to strengthen them in his own unwavering faith by feigned experiments, in which one pound seemed to be made into two. Alchemy and astrology have given place to other illusions; but Chaucer's alchemist is of all time, and always, believing with his whole heart that he prepares blessings for those whose faith is not so strong as his, in danger of using deception as he drags them down to be smothered with himself in the silver mine under the little hill Lucra. The Yeoman is drawn with the same force and truth. While he has not yet escaped from the spell which the Canon's positive conviction and firm will had cast upon him, he

boasts of his master's dignity and power; but he is disturbed by the host's question why so worshipful a man went about so ragged and dirty; and, when forced to remember the life in blind alleys among thieves, how he had blown the fire till his countenance was like lead and his eyes bleared, and had only succeeded in making himself a beggar, his trust is shaken, and fails altogether when his lord rides away, not daring to listen to the tenor of his life told by his servant. Upheld by the society of his fellow-workers and fellow-believers, like every man of them the Yeoman was full of faith, and believed himself as wise as Solomon; but now, surrounded by sceptics, old scruples revived, and he recollected that he had always been in some sort a doubter, although—notwithstanding he had spent all he had, had borrowed gold which he could never pay, and feared in his heart that the elixir would not be found—he never could resolve to cease from the work; for there still lurked within him a creeping hope that the discovery might one day come to pass.

There is one scene—it may be, too diffuse, perhaps the last eighteen verses might have been spared—excellent in its kind, from which Ben Jonson seems to have borrowed the description of the designed and accomplished destruction by Subtle of the elixir which, as he pretended, he had all but completed when it vanished in smoke through the wickedness of Sir Epicure Mammon. In Chaucer the ruin is accidental, and he tells in one word that the accident was always happening. The Canon had tempered the metals on the fire; the crucible in which they were bubbling burst, and, farewell! all was gone. The boiling metal flew hither and thither; part through the wall, part into the ground; part was scattered about the floor, and the rest leaped into the roof. The workmen fell to chiding; such woe, raucour, and wrath were there as are found only in the kingdom of Satan. One said that the fault was in making up the fire; another, that it was in the blowing—"Then," says the Yeoman, "I was afraid, for to blow was my office." "Straw!" quoth a third, "you are ignorant and foolish; the mixture was not rightly tempered." "Nay," said a fourth, "hold and hearken to me; the cause was that our fire was not made of beechen wood." So they strove together until the strife called forth the Canon. Calm and gentle, *pietate gravem ac meritis*, he hushed the tumult, spake of the bursting of the crucible as of a thing for which he looked as duly as for his daily bread; yet promised that it should never happen again; and, confident as though the stone were already in the pocket of his ragged garment, bade them pluck up their hearts and be merry:—

What? quod my lord, ther n'is no more to don,
Of these perils I wol beware of sone.
I am right sikur, that the pot was crased,
Be as he may, be ye no thing amased.
As usage is let swep the flore as swithe;
Plucke up your hertes and be glad and blithe.

LITERARY POLICEMEN.

A GOOD deal was said lately as to the opinions of the police on the subject of the early closing of public-houses, and it was remarked that policemen might be inclined towards any course that would save themselves trouble. The Report of the Commissioner of Police for the Metropolis which has just appeared supports this remark, and shows that some zealous superintendents carry their zeal for early closing to an extreme point. The force has lately taken a decided literary turn, and the early closing of public-houses would no doubt afford to policemen greater leisure for that "educational" advancement which has become necessary for promotion. It was easy to believe the statement of Mr. Cross that, if public-houses were closed and coffee-shops remained open, intoxicating drink would be supplied in an illicit manner; and the Licensing Act provides that all places of refreshment shall be closed at the same time. But if the advice of the Superintendent of the Marylebone Division be adopted, a further measure of restriction will be proposed next Session. "Coffee-stalls," he says, "should be prohibited between 12 at night and 4 A.M. They are simply common nuisances, and are not, except in very special instances, required." We do not speak from actual knowledge, but we infer that the compound sold at these stalls under the name of coffee is not often genuine; and if on this ground the police proposed to treat the stalls as nuisances, we should feel a certain sympathy, which we admit to be wholly unjustifiable, in the success of their proceedings. It is possible indeed that the so-called coffee may be occasionally fortified with a spirit equally undeserving of the name of brandy, and although this may be an offence against the Excise, it would be venial, or even praiseworthy, in a sanitary point of view. The police would probably be well pleased if everybody in London would go to bed at midnight and stay there until four o'clock; and they desire at any rate that those who are in the streets between these hours should be cut off from all possibility of refreshment. Another superintendent says that "the keepers of fried fish, pie, and oyster shops" continue to give trouble to the police and annoyance to the inhabitants. This officer writes from Whitechapel, and we are pleased to hear that that district has grown so genteel that its inhabitants object to the eating—at least in a disorderly manner—of eel-pies. The consumption of these delicacies appears to proceed in the manner least satisfactory to the police at those shops which do not offer sitting accommodation to their customers. The Report states that the Excise authorities refuse to license certain shops on account of their not having the requisite accommo-

dation, and that these shops more especially give trouble. We presume that these shops, not having licences as refreshment-houses, do not venture to keep open after nine o'clock at night, and before that hour the trouble they give cannot be so very serious. Eating fried fish standing up is not, we should think, a particularly exhilarating occupation, and persons who can get jolly over an eel-pie must possess remarkable talent for conviviality under difficulties. We do not object to the closing of fried-fish shops, licensed or unlicensed, at the same hour as public-houses, but this worthy officer, taking his tone doubtless from the Home Office as it was under Lord Aberdeen, seems to wish to close these shops altogether. Some of his colleagues seem to think it enough to say that "loose characters" frequent a shop in order to condemn it, but we venture to remark that even a prostitute may be lawfully supplied with an eel-pie. On particular occasions the West-end of London suffers from irruptions of "roughs" who are believed to be of Eastern origin, and probably if we pictured to ourselves these barbarians at the hearth fires of their race, we might conceive them to be engaged in the consumption of eel-pies purchased with coppers extracted from the pockets of West-enders.

It is gratifying to hear that in the Paddington division "only one crime of any magnitude" has been committed, and consequently the detective officers "have not had their energies directed to the apprehension of great offenders," who would probably have escaped. In this state of comparative leisure the superintendent of the division has addressed his mind to the consideration of the "educational test for promotion," and the style of his remarks convinces us that he at least need not fear the application of the test to which he objects. This test, he says, though it gives to the public intelligent, well-spoken, and well-informed men, shuts out many who would make the best officers. He would not suggest that there should be no educational qualification required, but he does think, and so do we, that upon the strong recommendation of the superintendent, the Civil Service examination might be waived in certain cases. We regard the method of examination as better than jobbery for admission; but as inapplicable, or nearly so, to promotion, which should depend upon the sense which a man's superiors have of his efficiency. The notion of the Civil Service Examiners selecting a detective sergeant by competition is rather whimsical. I have, says the writer, divisional detectives who are clever, experienced men, and but for the one drawback of want of education, would make the best detective sergeants, "for they are most energetic in the pursuit of offenders, will stand or lie in a mow, in a ditch, in a stable, a cab, or in a box, and will watch for hours without stirring, on purpose to catch or to keep observation on some persons whom they suspect, which I am afraid the educated detective would not do, and from their knowledge of crime and its perpetrators are certainly the best men to give instructions to others in intricate cases, but want of education keeps them from such a position." Certainly the mania for examination has gone pretty far if we apply it to the selection of officers of the detective police. It is doubtful whether an examiner could be found to set a paper on "Crime and its Perpetrators"; and the capacity for standing patiently up to the neck in a dunghill seems scarcely to admit of being measured by marks. The ingenious persons who undertake to choose detective officers by this method would perhaps be capable of proposing to set papers to all the inhabitants of a street until they discovered the perpetrator of a crime committed in it. Another superintendent testifies with equal emphasis against imposing an educational test on sergeants. "I find," he says, "that the very best policemen as regards thief-taking are men who generally are unable to pass the examination required for a sergeant." Thus a constable seized a suspected burglar and held him until assistance came, in spite of a violent blow with a "jemmy," under which perhaps a more scholarly head might have yielded. Another superintendent suggests, with even more force, that the educational test imposed upon a sergeant before he can become inspector should be modified. There are, he says, many sergeants "good practical policemen," well qualified for inspectors, who would fail to pass the educational examination, as we can quite believe. The wonder is that this absurd system of examination should have established itself so strongly.

We must admit, however, that by examination or other means the literary character of the police has been well sustained, and we can only hope that the authors of the district Reports before us have not disused the truncheon as they became familiar with the pen. Here and there severe criticism might find a blemish. Thus, one superintendent states that "stray dogs appear to be as prolific as ever"—meaning, not that stray dogs of the female sex produce puppies while in custody of the force, but only that stray dogs are numerous. The same officer discourses in a high moral strain upon the lamentable fact that "persons of a position in society" are among the visitors to night houses. He thinks they would never do so "if they would give the subject but a moment's serious reflection, and consider the result to themselves if their friends and relations were cognizant of their conduct." There are some twenty superintendents of police, and every one of them could write an essay in this style, and probably among them they could compose a magazine and review. Thus much education has done for the police, but whether it has made them more patient and skilful in watching and detecting thieves is questionable. The writers of the Reports take credit, and we hope justly, for having administered the Contagious Diseases Acts, so that the prejudice once entertained by many persons against

these Acts has become a thing of the past. An enthusiastic superintendent states that those persons now see that "the despised daughter of frailty" has a way of escaping from her degrading position through the kind influence of those with whom she is brought into contact by the operation of the Acts. The number of naval stragglers brought in by the police has been less than the year before, and this is treated as a result of "an improved tone of morality in the navy;" which must be gratifying to those commanders who take an interest in the welfare of the crews entrusted to their charge, "and who, it is pleasing to note, are becoming more numerous every day." We will not be so unkind as to suggest that the diminished number of stragglers brought in might be ascribed to relaxed vigilance on the part of the police. But we cannot help fearing that thief-taking and other cognate business may come to be regarded as secondary to the general supervision of the conduct and condition of all classes of Her Majesty's subjects, from captains in the navy to despised daughters of frailty and profligate dogs. It surely is beyond the province of the Superintendent of Police at Portsmouth Dockyard to estimate the degree of interest which naval officers take in the welfare of their ships' companies. The Superintendent at Woolwich Dockyard is happy in the occurrence of a topic particularly suitable to the display of his literary talent. "The year has been distinguished for visits made to the Arsenal by august personages." The Hereditary Grand Duke and Duchess of Russia and suite were received by their Royal Highnesses the Prince and Princess of Wales, and the Heads of Departments, &c. "The 21st June will long be remembered in Woolwich as the day on which His Majesty the Shah visited the Arsenal." It is not perhaps surprising that the Shah's visits to public places should have particularly impressed the memory of policemen, because his Majesty carried on his august person diamonds which all the thieves of London must have regarded with longing and despairing eyes as a magnificent but wholly unattainable "swag." Nevertheless we do not see the necessity of recording the names of the distinguished civil and military officers who accompanied or received the Shah, unless indeed it had been added that none of them had their pockets picked. "The day was beautifully fine" and many thousands of well-dressed persons "availed themselves of the privilege" of standing on the grass plots to view the ceremony. Then came the Hereditary Grand Duke of Russia and the Prince of Wales, and a few days later the Shah turned up again within the territory of this most fortunate of superintendents. This time he came to view Greenwich Hospital; he was attended by notabilities as before, and "a *de-jour* of the most *recherché* description" awaited him in the Painted Hall. This is really too much. We are sorry that the literary exercises of the police should end in unmitigated penury-aiming. But these are the beautiful results of education.

DEAN STANLEY ON GENERAL COUNCILS.

DEAN STANLEY has contributed to the *Contemporary Review* a short paper on "Christianity and Ultramontanism," designed, as he informs his readers, as a slight contribution—it is certainly a very slight one—towards completing a discussion recently carried on in that magazine. He adds, and the statement is repeated soon afterwards, that "it confines itself to the historical aspect of the subject." And to its historical aspect, especially in one important particular on which the writer has chiefly dwelt, our criticism will also be confined. We might indeed question at starting the historical correctness of the Dean's rather peculiar definition of Ultramontanism, as the theory that "in all times and places Christianity has been propagated by a corporation or caste of men, who have been the exclusive depositaries and expounders of its truths"; whereas the opposite, and as he holds the true, theory is that Christianity is propagated and the advance of truth and goodness accomplished, not by one particular corporation or order of men, or through any one form of polity, but "by the joint influences of all good elements in human nature, and in the order of the world, working together." This distinction of theories is, on the face of it, what logicians call a cross division, for no one in his senses ever imagined that the advance of truth and goodness in the world depended solely on the ministrations of a clerical corporation; while on the other hand there are probably not many who would care to maintain that Christianity has been, or is ever likely to be, propagated in the world without such direct agencies being called into play. The Dean is indeed himself obliged to allow that perhaps no one has held either view "with absolute consistency;" and he might have added that probably no one has ever professed to hold either view, in the form here stated, at all. What he really means, or must charitably be presumed to mean, is that one party holds an organized and visible ministry, with certain inherent rights and powers, to be part and parcel of the divine institution of Christianity, while another regards all such claims as mere variable accidents. In this sense his two theories have no doubt an historical existence, and the former might be roughly described as the Catholic theory, though it has been equally maintained by large bodies external to the Roman Catholic Church, as for instance by the entire Eastern and a large section of the English Church. At all events it is certainly not Ultramontanism, which, if we "confine ourselves to the historical aspect of the subject," means a particular theory about Papal rights and prerogatives maintained by one, and denied by another, party in the Roman Catholic Church. On the re-

spective merits of their views the Dean's slight contribution throws no light whatever. He probably thinks the controversy beneath his notice, and considers both sides about equally in the wrong; and of course he has a right to his own opinion on the subject. Only it remains true that the title of his paper is a misnomer. And its incongruity becomes the more amusingly conspicuous when we find him taking, as the chief and "most obvious case" for testing the historical weakness of what he calls the Ultramontane theory, the example of General Councils. No doubt Ultramontanes, being Roman Catholics, are obliged to admit the authority of General Councils; but, if there is one point which sharply distinguishes their theological attitude from that of the opposite section of their co-religionists, it is their studied depreciation of Councils in comparison with the loftier and more available authority of Popes. However, we are not going to discuss here the abstract merits of Catholic and Protestant, or of ecclesiastical and Erastian views of Church government—and this latter theory is what the writer is throughout really advocating—still less the pros and cons of Ultramontanism proper, to which he scarcely adverts at all. He has given us an historical summary of the action of General Councils from Nicaea to Trent, according to his own estimate of their proceedings, and to a brief examination of some of its leading points we propose to devote such space as remains to us.

The Dean of Westminster has written some Historical Sketches of the Eastern Church, and was once a Professor of Ecclesiastical History. While therefore an attack on the pretensions of General Councils struck us as a very strange method of illustrating the falsehood of Ultramontanism, we turned with considerable interest to his review of the proceedings of those assemblies in times past. We are sorry to be obliged to add that we turned from it after a careful and wondering perusal with a blank sense of mingled perplexity and disappointment. Though he professes to be running through the whole line of General Councils, the Dean has in fact selected seven only out of the twenty or twenty-one commonly so-called—four of the ancient and three of the mediæval Church—whereby to illustrate his theories. The first four Councils from Nice to Chalcedon, to which the Church of England appeals for her standard of heresy, are thus summarily dismissed. "The Council of Nicaea—what is there that actually remains to us from that venerable assembly? A creed which, however good in itself, was for the most part not composed by the Council, but only adopted by it . . . and of which the only word of importance inserted by the Council was adopted as a mere party move, and afterwards hardly ever used by Athanasius, its chief champion." The Nicene Creed was not composed by the Council of Nice in precisely the same sense in which the Toleration Act was not composed by the English Parliament. And it would be just as true to say that an Act of Parliament is not really the work of Parliament, but of the member who proposes or the draftsman who puts it into shape, as that creeds or canons are not really the work of the Council which authenticates them. And as to Athanasius's politic and provisional abstinence from the use of the famous formula (*homoousios*), in order to win over the Semi-Arians, it proves nothing whatever as to the fitness of the term for the purpose for which it was originally devised, and to which it has been applied from that day to this. Of the Council of Constantinople we are told still more briefly, and with even less approach to accuracy, "Nothing is now cherished except a portion of a creed which it certainly did not compose." From the Council of Ephesus "there remains only the famous word *θεωσμός*, which has not been deemed worthy of acceptance in any Protestant Church"—a statement which is incorrect if the Church of England is meant to be included under the category, and irrelevant if it is not. For no decrees of the ancient Councils are deemed worthy of acceptance by the foreign Protestant communions. We are finally asked "How many Christian pastors of any Church have gone to the stormy debates and ambiguous decisions of the Council of Chalcedon?"—which most unambiguously condemned Eutychianism—"for the purpose of refreshing their spiritual life?" It would be about as reasonable to ask how many Christians have gone to the *Pilgrim's Progress* for the purpose of learning the true doctrine of the two natures of Christ. We have no time to enter here on a vindication of the first four General Councils, and it is quite enough to observe that Dean Stanley has judged them—detailed inaccuracies apart—by tests which are so transparently inapplicable as to deprive his statement of any value whatever. But, as he refers to Hooker as a high authority in a later part of the article, and as Hooker was certainly very far removed from any suspicion of Ultramontanism, we may perhaps venture to remind our readers of a well-known passage in the fifth book of the *Eccelesiastical Polity* giving his very different estimate of the matter:—

To gather, therefore, into one sum all that hitherto hath been spoken touching this point, there are but four things which concur to make complete the whole state of our Lord Jesus Christ: His Deity, His manhood, the conjunction of both, and the distinction of the one from the other being joined in one. Four principal heresies there are which have in those things withstood the Truth: Arians by bending themselves against the Deity of Christ; Apollinarians by maining and misinterpreting that which belongeth to His human nature; Nestorians by rending Christ asunder and dividing Him into two persons; the followers of Eutyches by confounding in His person those natures which they should distinguish. Against these there have been four most famous ancient general councils; the council of Nice to define against Arians, against Apollinarians the council of Constantinople, the council of Ephesus against Nestorians, against Eutychians the Chalcedon council.

And, after speaking of the terms used for this purpose, he pro-

ceeds:—"Within the compass of which four heads I may truly affirm that all heresies which touch the Person of Christ, whether they have arisen in these later days or in any age heretofore, may be with great facility brought to confine themselves." On the theological bearings of the matter we of course say nothing here. But the extract just given will at least suffice to prove that writers not less eminent or learned than Dean Stanley, and quite as little open to the imputation of Ultramontanism, are completely at issue with him as to the substantial and permanent services rendered to Christianity by the ancient Councils of the Church.

From the Council of Chalcedon in 451 the reviewer passes at a bound to what he somewhat enigmatically calls "the Council of the Lateran." As there were four Lateran Councils, the first of which was held in 1123 and the last in 1215, we were at first wholly at a loss to know what Council the Dean had in his mind. His comment on "the Council of the Lateran" is that "it gave us its sanction of Transubstantiation and of the Albigenian Crusade." The former part of this statement might be applied to two of the Lateran Councils; the latter is not true, except in a very indirect sense, of any of them. The teaching of Berengarius on the Eucharist—which may be described in later phraseology as Zwinglian—was condemned at the Second Lateran Council, and the dogma of Transubstantiation formally defined at the fourth. It is apparently to this last that the reviewer refers, for, although the crusade to which it gave its sanction was not the Albigenian, but the fifth crusade to the Holy Land, afterwards conducted by Andrew II. King of Hungary, it assigned to De Montfort the cities taken from the Albigenians in France, and may thus be said to have given a kind of *ex post facto* sanction to the war. Had the sanction been more direct, the case is not such a simple one in its "historical aspects" as Dean Stanley appears to suppose. The Albigenian heresies were to the full as violent an outrage on the public opinion of Christendom in that day as Mormonism is in our own, and a high ecclesiastical dignity might have been expected to remember that the direct sanction given in the Old Testament to the extermination of the Canaanites does not stand less in need of explanation than the indirect condemnation accorded after the fact by the Fourth Lateran Council—if it is the fourth to which he refers—to the wars of Simon de Montfort. Once more the reviewer passes *sicco pelle*, not this time over eight, but over more than two centuries, and four intervening General Councils, and pounces on the Council of Constance—the very last, one would have thought, in the whole series to be included in an indictment against Ultramontanism. And here he is even less felicitous than in his dealings with "the Council of the Lateran." At Constance, to quote his own burning words, "the blameless John Huss was burnt alive, the infamous John Petit, and the infamous John XXII. (XXIII.?) with difficulty condemned, almost condoned." And then, appropriating a statement of Hallam's which later criticism has conspicuously disproved, he adds that "it is easy to weigh the retrenchment of a few abuses against the formal sanction of an atrocious maxim." This of course refers to the supposed decree of Constance, triumphantly cited by Gieseler, that no faith is to be kept with heretics, which however, if not a pure fabrication throughout, is at best a draft of a motion proposed by some member of the Council, but certainly never accepted. Nor had the Council any need to adopt it as an apology for burning John Huss. Dean Stanley should know better than to endorse the worn-out calumny about what Coleridge calls with ingenious infelicity "the Pope-wrought perfidy, that made an empire's plighted faith a lie," forgetting that the "perfidy" at all events could not be "Pope-wrought" at a time when there was no Pope. But in fact there was no perfidy at all. John Huss came to Constance, as he himself repeatedly stated, with no other safeguard than a verbal promise from the Emperor of protection on his journey, which was faithfully kept. The written safeguard reached him after his arrival there and guaranteed him against all violence on the road to or from Constance in the event of his return, but did not and could not guarantee him against the sentence of the supreme tribunal to which he had himself appealed, and by whose judgment he had over and over again declared his readiness to abide. That burning heretics is an "atrocious" practice we have no desire to dispute, but it was in accordance with the universal custom and sentiment of the day, and Huss himself did not complain of the sentence on the ground that it was a breach of faith, or that burning heretics is wrong, but simply on the ground that he was not a heretic. But, judged by any standard of doctrine which the Council could possibly recognize, he was undoubtedly a heretic, and it so happened that some of his opinions were of a nature to be far more alarming to civil than to ecclesiastical authorities, and would, if consistently carried out, have made all regular government in Church or State an impossibility. Hence the extreme bitterness manifested against him by the Emperor Sigismund when it became clear what his real opinions were. As to the Dean's sensational contrast of Huss with "the infamous John Petit and the infamous John XXII.," that may be dismissed in very few words. Jean Petit, as we had occasion to mention the other day, wrote a work in defence of tyrannicide which the Council of Constance condemned. His doctrine may be "infamous," but it was maintained by a host of later writers, Catholic and Protestant, to some of whom at all events even, Dean Stanley would scarcely venture to apply that epithet, and we are not aware of any charges against the personal character of the author. As to "the infamous John XXII." (XXIII.) we must be content to refer the Dean to Hefele's volume on the Council of Constance, his utter ignorance of which is attested by every word he has written on the subject. John was

certainly no saint, but there is no evidence that he was any worse than the general run of dignified ecclesiastics of the day, though he was greatly their superior in ability. The contemporary judgment of Leonardo of Arezzo is probably not far from the mark:—"Vir in temporalibus quidem magnus, in spiritualibus vero nullus omnino atque ineptus." It was more on ecclesiastical than moral grounds, and on account of his breach of faith in deserting the Council, that it suspended and deposed him.

It is admitted that the Council of Trent effected many useful reforms, and that the chapters on Justification throw a good deal of light on an important subject, but we are asked whether "its acts contain anything like a code of permanent and universal truth," as though it were the business of a Council to compose a supplementary Bible. And in the same spirit the writer, possibly haunted by some vague consciousness that his detailed indictment against the acts of General Councils is not very conclusive, proceeds to notice their omissions:—

How many are the good words and works in which the Councils have had no part? The Creeds: Even the Nicene or Constantinopolitan Creed is in substance the creed not of a Council but of Eusebius and Epiphanius. The Apostles' Creed, and, with all its merits and demerits, the Athanasian Creed, is not sanctioned by any Council at all. The Canon of Scripture: It was not adopted, or sanctioned, or explained by any Council until the Council of Trent; and the decision of that assembly, recognizing as authorized only the received version of the Vulgate, no educated man, either Roman Catholic or Protestant, can in the present day accept. Theology: Is there any single theological question which any Council or Synod has argued or decided with an ability equal to that of any of the great theologians, lay or clerical? The nearest approach to it are the chapters on Justification in the decrees of Trent, and on the Bible in the Westminster Confession. But how inadequate to the needs of the case, how inferior to the truly inspired utterances of individual genius!—to the enlightenment of the world by Origen, by Jerome, by Augustine, by Dante, by Hooker, by Bacon, by Thomas à Kempis, by Bossuet, by Luther! The formation of the hymnology, or of the music, or of the liturgy, or of the morals of Christendom—all these were the works of public opinion, of general instinct, or of gifted individuals—not the work either of a general council or of the corporate or synodical action of the clergy as such.

And again soon afterwards we are solemnly informed that the whole literature of Christendom, its poetry, philosophy, history, hymnology, science, and theology, its art and legislation for at least three hundred years—during which period by the way there have been no General Councils—its charities and philanthropic institutions, are the work of other agencies. No doubt. But it is impossible to read this portentous catalogue of the services which Councils have failed to render without being reminded of the very similar complaint made against *Paradise Lost*. "After all, it proves nothing." After all, says the Dean of Westminster in effect, whatever else Councils may have accomplished, they did not give us the art, the literature, the science, the painting, the poetry, the history, the hospitals, not even the theology of Europe. They cannot match the intellect of Augustine, or the depth of Origen, or the wisdom of Hooker, or the science of Bacon or the genius of Bossuet, or the devotion of Thomas à Kempis. And therefore at the bar of history they are self-condemned. Neither, we may add, did the English Parliament give us our national literature, or poetry, or music, our ancient Universities, our churches, our scientific institutions, our railways, our electric telegraph, our benevolent societies, or even our political economy. Shakespeare and Milton and Wordsworth, Gibbon and Hume, Adam Smith, Burke, Watt, Stephenson, Faraday, Mill, and hosts besides of not less memorable names, are due to other agencies than can be found in the Palace of Westminster. Even the laws made in Parliament "are not composed but merely adopted by it." Therefore it is absurd to talk of Parliamentary government as the palladium of our liberties and source of legitimate authority. The advance of the national spirit and national welfare is promoted "by the joint influence of all good elements in [English] nature, and in the order of the world working together," and not by particular Acts of Parliament. It is hardly necessary to pursue the parallel further. We may hope that before the Dean again enters on the history of General Councils he will have paid a little more attention to the facts of the case, and have learnt to take rather a wider view of its bearings on the history of the Church and the world.

TEMPLE BAR.

THE disturbance of Temple Bar is at any rate a visible proof that work has been seriously commenced upon the Law Courts. The digging of the foundations of the new edifice has been proceeded with so energetically, and we might almost say inconsiderately, as to cause a slipping or sinking of the ground supporting the old and, as some would say, venerable structure. It is perhaps not to be regretted that a question which might have given trouble has been thus practically settled. The decision is said to be reserved for the Common Council when they meet after their vacation, but, however they may invigorate themselves by change of air and scene, they will find their strength unequal to keeping Temple Bar in its familiar place. If it cannot stand without hoarding and shoring it had better come down, because the most enthusiastic antiquary can hardly admire a structure composed partly of stone and partly of planks and timber. And further, although the Bar remains, and is as well as can be expected under the circumstances, the gates are gone, and gone never to return. The ceremony of closing them on the approach of a herald with a proclamation can never be repeated. We do not know whether the gates have been carried, but we are sure

that not even a general and an army could bring them back. Lord Ellenborough desired on a memorable occasion to show that the wave of Afghan conquest had been rolled back from India by British power. But not even Lord Ellenborough could resist the progress of that change which has removed these gates from Temple Bar. It would indeed be almost as easy to replace above the Bar the mouldering heads of traitors. But if the Bar must lose its gates, it had better disappear altogether from its present site.

Yet the removal of Temple Bar, whenever it shall be consummated, will be matter of regret, just as we regret the substitution of commodious modern houses with plate-glass shop-fronts for the dark and awkward, but picturesque, dwellings of mediæval traders. Nothing so surely carries back the mind to the past as its visible monuments, and a mind can hardly be in a healthy state which dwells wholly in the present. On this account we think it would be worth while to re-erect Temple Bar on the best site that can be found for it. As long as it stands anywhere, the recollection will survive that it served, among other purposes, to exemplify the justice or vengeance of Government against traitors. For many months a play has been performed at the Olympic Theatre of which the subject is a Jacobite plot for the assassination of King William III. The play is founded upon a real plot for which the authors suffered death and gave their heads and limbs for the ghastly ornamentation of Temple Bar. These victims were of the party which a few years before had triumphed even more savagely. After Monmouth's defeat there was no town or village of Somersetshire that had supported him which had not always before its eyes horrible examples of the penalty of rebellion. Macaulay relates that a labouring man who assisted the executioner at Taunton in the disgusting process of seething the quarters of traitors in pitch was called in his village "Tom Boilman," was shunned like Cain, and perished by lightning, which his fellow-villagers regarded as Heaven's vengeance for his sinful and shameful work. It is easier for us to conceive the state of mind which delighted to witness cruel and sanguinary punishments than that which endured the obtrusion of hideous objects on daily life. Every time that the Guildhall and the Halls of the great Companies entertained guests of rank and fashion from beyond Temple Bar, these guests passed under an archway garnished with human heads and limbs. Belief in the deterrent effect of punishment was in those days absolute, and in a struggle for life and death between rival parties in politics and religion all means were used without remorse to put down and keep down enemies. We could easily bring ourselves under the influence of terror and hatred to cut off heads, although we may now think such severity far from our refined natures. But it may be doubted whether any panic or provocation could induce us to fix our victims' heads on spikes and look at them as we drove to dine off turtle and venison with the Lord Mayor and aldermen. The nearest approach to the feelings of those times was made in India, when the blowing away of Sepoys from guns was used as a punishment, doubtless necessary, for mutiny. Colonel Stuart, in his *Reminiscences of a Soldier*, has lately described the share which duty compelled him to take in one of these executions. He placed a party of his men immediately behind the gun, and we will not enter into further details. Yet this punishment was adopted under the belief, apparently well founded, of its deterrent effect; and as Colonel Stuart writes:—"We were living in times when no one could tell what a day would bring forth, and we had plenty of evidence that the corps most faithful yesterday would with pleasure cut our throats to-day." These words of a man now living may help us to understand how our ancestors, when King William III. had narrowly escaped assassination on his way for a day's hunting in Richmond Park, cut off with alacrity the heads of the conspirators, and stuck them up on Temple Bar.

Let us try to realize another event nearer to our own time, which furnished indeed the latest horrors of the Bar. In the month of November 1745 the state of affairs in England was most alarming. Prince Charles Edward had landed in Scotland in the last days of July, and being joined by large numbers of Highlanders, had outmanœuvred General Opepe, the commander of the few Royal troops in Scotland, taken possession of Edinburgh, and defeated the Royal army at Preston Pans. Meanwhile, regiments which had shared the honourable but disastrous battle at Fontenoy were brought from Holland to London and marched to the North. Dutch, Danes, and Hessians, as well as English regiments, were employed against the Highland savages who were threatening to capture and sack London. The King reminded the officers of the Guards of the precarious condition of the country, and told them that, though he had had so many recent instances of their exertions, yet the necessities of the time induced him to demand their services again. Thus exhorted, the Guards marched to Lichfield and joined the Duke of Cumberland, who warned the Government that they must prepare for the defence of London in case the Highlanders should slip past him. There is a tradition that the Duke hanged a tollgate-keeper who gave him untrue information as to the enemy's movements. This week in which Englishmen have invaded Scotland in large numbers may be opportune for remembering the Pretender's march to Derby. At that day a Highlander was regarded not with sentimental admiration, but with disgust and horror. On the 2nd December the Duke, in order to intercept the insurgents on their march to Chester, advanced to Stone, expecting an encounter; but Lord George Murray, the Commander-in-Chief of the Highland

army, suddenly turned with his men to the left, gained by a forced march the high road to Ashbourne, and on the 4th reached Derby, thus placing himself between the Duke and the metropolis. The *History of the Grenadier Guards* lately published gives some curious details of the military incidents of this, the last campaign on English soil. The Londoners were resolute in adherence to their Protestant and Hanoverian King. "Several wealthy citizens enlisted as volunteers in the Guards." A camp was formed to cover London, and the movement of some companies of Guards thither furnished Hogarth with the idea of his picture of the "March to Finchley," which, however, is a caricature. Scouts were sent into Northamptonshire and Huntingdonshire, and Englishmen armed and drilled generally, and prepared themselves to dare and endure, and, when their time came, to inflict, just as did their descendants when the tide of Indian mutiny rose daily higher, and showed as yet no sign of turning. If the Highlanders really had reached London, we may doubt whether romance and poetry combined could have made the name of Macdonald and Cameron other than odious in Southern ears. But they, finding no support in England, retreated from Derby towards their own country, and the Duke pursued them, having for expedition mounted a detachment of Guards on horses furnished by the farmers. But soon an alarm of invasion from Dunkirk recalled the Duke to London, and in his absence General Hawley was defeated by the Highlanders at Falkirk. However, the French did not strike at the right time; the tranquillity of London was restored, the volunteers returned to their civil duties, and the Duke marched again to Scotland, and crushed the last hopes of the Stuarts at Culloden. The termination of the rebellion was followed by the trials and punishment of its leaders. Lords Balmerino and Kilmarnock were executed on Tower Hill, and other rebels suffered on Kennington Common. Lord Lovat was executed a few months afterwards. It cannot be said, looking at the magnitude and character of this rebellion, at the ideas which had always prevailed as to the treatment of vanquished rebels, and at the length and bitterness of the struggle between Catholics and Protestants and the Houses of Stuart and Hanover, that these punishments were excessive either in number or degree. Death to noble traitors by the axe had always been the law; and it had become habitual, and was supposed to be a salutary deterrent practice, to stick their heads on spikes and leave them to wither in the sun and wind. Thus it was natural that Temple Bar should become once more and for the last time a place of skulls. Happily for us our civil and religious differences are now for the most part settled at the polling-booth. But if we suppose the fate of Throne and Church to depend upon an imminent battle between one army advancing from Derby and another encamped at Finchley, we shall gain some idea of the excitement of the minds of Londoners in December 1745, and shall not violently blame, even if we may regret, the severities which they wreaked on their defeated enemies a year later. Rather let us own that in a time of equal peril we could not show more courage, and might easily show as much blood-thirstiness. This lesson Temple Bar as long as it stands may profitably teach.

THE SURREY ASSIZES.

AT the conclusion of the Guildford Assizes Mr. Baron Bramwell made some important remarks upon the business done or left undone there, which have been supplemented by an interesting statement in the *Times* of what may be called the birth and character of the causes entered for trial, and of the ends they came to. This statement is valuable as showing the condition to which the judicial arrangements of the country have been reduced, and the urgent need of that reform which the Judicature Act professes to supply. The business of this assize, so far as it has come before the judges, has been disposed of by two judges in thirteen working days, but this could only be done by the assistance of a learned gentleman, one of Her Majesty's Counsel, sitting in a third Court, and trying common jury cases. We do not object to this practice, which a glance at the Assize reports will show to be frequent, and we have only to remark upon it that the country thus gets the benefit of the service of a highly-trained lawyer without paying for it. The experience thus gained is doubtless useful to those who may hereafter become judges, and the practice of including Queen's Counsel and Serjeants in the Commissions of Assize is part of that ancient system which we should desire to protect against hasty and ill-considered change. But there has been held at Guildford what was virtually a fourth Court, in which another Queen's Counsel has been sitting as arbitrator in a case which, under the existing system, could not be tried in a regular court at all. This was an action by a Surrey landlord against a tenant for breach of covenants as to course of husbandry, and it involved matters with which a jury of farmers would be far better acquainted than one of tradesmen. The sittings of the arbitrator have been public, and they have been freely attended by the farmers of the neighbourhood, among whom the case has excited considerable interest. This statement, which we take from the *Times*, would go far, in our judgment, to show the expediency of continuing to hold an assize at Guildford. It is desirable that farmers and other classes should attend the hearing of cases in which they take an interest, because they may thus learn something that may be useful to them.

Wherever courts of justice are open auditors frequent them, and the attendance upon judicial proceedings is a valuable part of political education. This case appears to have been peculiarly suitable for trial by a jury chosen, according to the old principle, from the neighbourhood where the case arose, and we assume that the reason for referring it to an arbitrator was the impossibility of obtaining at this time of the year the attention of a judge and jury. But even if we suppose that the case was unsuitable, from its complication, for trial by jury, that is no sufficient reason, irrespectively of present rules of practice, why it should not be tried before a judge. The consent of the parties which would be necessary to arbitration would suffice for trial before a judge without a jury, but the consent of the judge would also be necessary, and that he might reasonably withhold. He might fairly say that he had not time to get through the regular duty of the assize and could not assume any responsibility that did not properly belong to him. It comes, in fact, to this, that a cause which would require several days to try cannot be tried at all, and the parties must provide a judicial tribunal at their own expense. If a tax were imposed upon all suitors alike none could complain, and, in fact, a tax is imposed upon all suitors who try their cases before special jurors. But it often happens that suitors cannot have what they want even by paying for it. In fact the judges who hold the Summer Assize are like tradesmen who cannot meet their liabilities. The most importunate or lucky creditors get paid in full, and other creditors get nothing. Mr. Baron Bramwell appears to think that even if assizes continue to be held at Guildford and the two other towns which have been used to have them, the suitors would prefer to resort, when the new judicial system is established, to London; and perhaps to a large extent they would. All we should contend for is that the option of doing so or not should be reserved to them. If a case arises in the neighbourhood of Guildford, it is easier to try that case at Westminster than at Croydon, because the journey by rail is half an hour shorter, and there are more trains. But if a case arises in the neighbourhood of Guildford, it may be tried at Guildford if the assize happens to be held there, and if not it may be tried at Westminster. There can be no possible objection to offering this alternative, except that it might involve an occasional waste of a judge's time, and this Mr. Baron Bramwell properly says ought not to weigh against it. He expects, indeed, that the County of Surrey will arrive at the conclusion that its assizes can be most conveniently held at Newington, and if that be so, there is little use in contending for the local principle, because Newington is part of the metropolis. We think there is much to be said against centralization, but if those most interested give up the contest, outsiders can hardly be expected to maintain it.

The remark of Mr. Baron Bramwell that "the question turns on *Bradshaw*" tells both ways, because, if it is easy for the suitors of Surrey to come to Westminster, it is easy also for the judges of Westminster to come to Guildford. As regards the alleged disposition of the county to do its business at Newington, it was explained at the county meeting held at Guildford on Thursday that, as regards the criminal business, the prisoners are at Newington already and it is inconvenient to remove them. As regards the civil business of Quarter Sessions, it appears that when the question of its removal was brought forward at Guildford it was rejected by a large majority, and when the same question was brought forward at Newington it was carried by a majority of one. Further discussion of this question will probably produce something like agreement as to what is the most convenient course. As regards the general question, it is manifest that the arrangement recently proposed of the circuits has gone upon the idea that there are only so many judges disposable, and, as two more judges are wanted for the North, they may be taken from the South. The people of Surrey may reasonably object to the question being dealt with in this way. Let the public convenience be first considered, and let the number of judges which it requires be appointed, but do not fix the number of judges and then compel the public convenience to adapt itself thereto. It has been suggested as one means of lightening the labours of judges at assizes that an enlarged criminal jurisdiction should be given to magistrates at Quarter Sessions. But this proposal also ought to be considered on its merits, and there is obviously much to be said against it. Supposing it to be adopted, there would be an immediate revival of the demand which has been frequently urged for appointing paid Chairmen of Quarter Sessions, and this certainly would cost more than any probable saving of judges' salaries. At present, when a judge tries prisoners at the assizes many magistrates come into court and listen, and they are likely to hear something that may be useful in the performance of their own duties. It was well said by a speaker at the meeting that "the object of the assizes is that people should see and feel how the law is administered," and thus learn to respect and place confidence in the law. That is an object of the highest importance which cannot be exactly appreciated in money, and which therefore some minds have a tendency to disregard. The members for the county of Surrey will doubtless press this consideration upon Government and Parliament. They may fairly urge that the reason why so few county cases had been tried at the late assize was that "the parties knew that, if the proceedings were likely to last any time, the chances were that the case would not be heard." It is desirable, however, that these cases should be tried in the county, and that proper time should be given for trying them. Suitors are now subjected to a constantly increasing pressure to consent to

refer or settle their cases, and if they resist to-day they yield to-morrow. The *Times* states that more than a hundred cases out of 160 were withdrawn from trial, or disposed of without being really tried, and we may be tolerably sure that if the same cause list were commenced at Westminster next November by a judge sitting continuously, a much larger proportion of them would be tried. If this be so, the necessity is manifest for some such improvement as the Judicature Act proposes. The truth is that if the lawyers had been alive to their own interest, they would have established continuous sittings with juries at Westminster or in the City of London twenty years ago, and they would have devised some system by which, before the expense of preparing for trial was incurred, the cases which are and are not suitable for trial by jury could have been distinguished. Few judges who have had much experience would desire to take upon themselves the decision of questions on which there is contradictory testimony, and in what are called "running down" cases judges usually congratulate themselves that the question is for the jury, and not for them. In these cases and many others, the various experience of the jurymen is a valuable help to their decision, and thus there are questions as to the amount of damages which no judge could settle satisfactorily to himself, and which are far better settled by persons brought together casually for the purpose. It would be inconvenient, to say the least, that a judge should acquire a reputation for placing a high value upon the wounded feelings of young ladies, or should have to place a value on their feelings when he was known to hold a strong opinion that they ought not to be compensated in money at all. We do not think, therefore, that trial by jury in suitable cases is likely to become unpopular, but it is time to put an end to the absurd practice of summoning jurors to try 160 cases when it is perfectly well known that not one-third of them will be, or can be, really tried.

BASE-BALL.

AS a man's nature is most readily detected in his unguarded moments, so the characteristics of a nation appear most clearly in its games. The coolness, persistency, and careful skill of the English find an apt field for their exercise in cricket. The nervous fiery temperament of the Gaul allies itself happily to his love of finesse, his possession of the *esprit Gaulois*, in the quick yet well-planned combat of the foil. The same tendency to let off superfluous energy by the means of personal conflict which belongs to the fencing schools of Paris assumes a form which has a more serious and a more grotesque side among the students of Germany. With them the harmless encounter of buttoned foils is replaced by the duel with the *schläger*, a blade peculiar to the German Universities, which from its combined tenuity, flexibility, and sharpness, may be said to resemble a harlequin's wand with a razor's edge. To mitigate the savagery of the contests which might be entered into with such dangerous weapons as these, the practical good sense which pertains to the German character stepped in and muffled the student duellists to the chin in impenetrable paddings, while it protected their eyes with iron-rimmed spectacles. So thick is the leathern armour provided for the warriors that many of the cuts delivered with the keen blade are parried by the padded right arm. In this curious arrangement of apparent danger and actual safety, the German mind perceives, as a rule, nothing ridiculous. On the contrary, the institution of duelling is regarded by the German student exactly as is that of cricket by the English public schoolboy or undergraduate. It is his physical religion. We remember a conversation between two undergraduates, one of an English, the other of a German University. The German inquired what were the sports in favour among the youth of English University life. There was cricket, he was told, and boating and various other athletic amusements. "But there is no duelling?" "No." "Ah, then it cannot really be a University." Preconceived ideas of duelling do not quite accord with its interpretation at a German University. In the world at large a duel used to imply an individual quarrel between two members of the community. Among German students it signifies merely a trial of skill between the members of two *corps*. Side is opposed to side exactly as in cricket; but each side offers only one representative at a time. Whatever shred of likeness there may be between the nose-slitting amusement of Bonn and Heidelberg and the cricket of our Universities or of our public schools, there is this wide difference, that Englishmen who have in their young days been devoted to cricket never lose their interest in it in after life, while the most renowned swordsman of a German *corps* will in the course of a few years regard his prowess as a vain thing fondly imagined. But indeed it would be as absurd seriously to compare cricket with this student duelling as with the cruel bull-fight of Spain or the lazy but harmless, if childish, *morra* of the Italians. It may be said that there is another game of some importance in Italy, which, resembling tennis in some points, may be called a variety of the genus cricket in that its component parts are a ball and a striking power. But this game is not sufficiently widespread or popular to deserve the title of national.

It would be surprising if America, cherishing many institutions of the old country, should pass over one so venerated as cricket. It is also in accordance with the spirit of independence which is the boast of Americans that, while they look kindly on the English national game, they should strike out a new game to be more especially their own. The friendly rivalry existing between

England and America led some while ago to a contest between the "wet-bobs," to use an Eton phrase, of either country, and it was only fair that the "dry-bobs" should show what they could do. Cricket-matches between Americans and Englishmen are not without precedent, for in 1859 America challenged England at cricket, and the challenge was accepted by the best English Eleven of the time, who went out to America and returned having reaped success. It is possible that the supremacy of base-ball over cricket was not then so firmly established as it is now on the other side of the Atlantic; now the older is clearly held inferior to the younger game. It may be that the love of invention, of creating something new, which belongs to a new people, has led to the up-raising of base-ball above all other games. Yet in the essence of base-ball there is nothing new. A letter in the *Times* has pointed out that in 1748 a game called base-ball was played by the family of Frederick Prince of Wales. It is possible that the resemblance between this and the American game of to-day extends further than the name. The origin of base-ball may be traced back without difficulty to the club-ball of the fourteenth century. In Strutt's *Sports and Pastimes* there is a representation of two men engaged in this amusement, or in one very closely akin to it. One is delivering a ball to the other, who stands with the deprecating aspect which seems inseparable from mediæval figures, ready to receive it with a rude kind of club. In this delivery of a ball and its reception with a bat, the germ both of cricket and base-ball is easily recognized. It is curious that the attitude of the two figures is more nearly approached in base-ball than in cricket. This may be taken as an indication either that the American game is an intermediate step between club-ball and cricket, or that the base-ball players have employed a conservative wisdom in rejecting the branches to get to the root of the tree. The former interpretation is likely to find general acceptance, inasmuch as all men who have been schoolboys will recognize in base-ball the development of a game which was common in their school days, and being held inferior to cricket, was regarded rather as a trivial amusement wherewith to while away an odd half-hour than as a serious sport to which much time and practice were to be devoted. Base-ball is, in fact, a kind of glorified rounders.

The method in which the runs are obtained is precisely the same as at rounders. The rough humour which put a man out by hitting him with the ball as he ran has disappeared, and seems to have been replaced by the throwing of the ball into one of the goals or bases before the runner reaches it. The bat used is a development of the stump or stick employed at rounders by English schoolboys, and may be said to come between it and the cricket-bat, as the German student's *schläger* does between the small-sword and the sabre. That the use of the bat is not the most important feature in base-ball is at once evident. Thus one of the chief beauties of cricket is absent from the game. There are none of those pretty cuts, well-judged drives, and wary receptions of dangerous balls which are the delight of the spectators at Lord's. On the other hand, it may be said that most of the niceties of batting at cricket are lost upon spectators without special knowledge. The hard hitting which appears the main object of the batsman at base-ball appeals to all who see it, however ignorant they may be of the game. But the absence of a wicket to be attacked and defended is a serious disadvantage to base-ball in the eyes of on-lookers. In the matter of bowling also the American seems far inferior to the English game. The variety of the English bowling contrasts favourably with the apparent monotony of the pitching at base-ball. There is probably a great deal of skill in this which it is impossible to discern without a close acquaintance with the game; but the constant employment of the same action by all the bowlers strikes an English eye as wearisome. On the other hand, base-ball is free from the weariness which comes over the spectators of a cricket-match when steady play on both sides is evinced by the fact that for some half-hour or more nothing happens except the movement of the field and the change of bowlers at the end of every over. In base-ball, action is continuous and rapid. The interest lost in the matter of bowling and batting at base-ball is made up in that of fielding. After due allowance is made for the difference between a cricket ball and the ball which is employed in the American game, the fact remains that the fielding of the American players is singularly accurate. The certainty with which catches are made, the judgment and quickness with which the field back one another up, the neatness and rapidity with which balls are stopped and thrown in, might serve as models to cricketers. The employment of one of the side who are in to watch the movements of the field and advise the runner accordingly is a quaint device which savours of American acuteness. The running is of course a great element of the game, and is a very pretty feature in it. It gains in grace probably from the fact that the runner is not embarrassed by a bat. One curious circumstance of base-ball is the waste of force which follows from the rule according to which all hits must be made within certain limits. By this means all the fine hits in the direction of square leg go for nothing. Another remarkable feature of the game is the process which takes the place of stumping out by the wicket-keeper at cricket. If a runner unwarily advances too far from his base in order to gain beforehand some of the distance which he hopes to run, it seems competent for the bowler to put him out by throwing the ball into the base before he can return to it. This gives rise to the employment of the same kind of histrionic feints and ruses which make a distinguishing feature of American card-games.

A bowler will watch his opportunity two or three times, and apparently abandon the idea of outwitting the runner. Then, as he seems about to deliver the ball, with a marvellously rapid change of action he will do his best to throw the runner out. This amongst other things lends a variety to the game, and helps to keep the spectator amused. Base-ball is certainly pretty to look at, and probably appears a game of considerable skill and interest when the intricacies which it has gathered to itself in the process of development from rounders are mastered. It is not likely, however, to become so popular in England as to endanger the reign of cricket.

LOAN EXHIBITION FOR ALSACE AND LORRAINE.

A COLLECTION of choice paintings and rare works of art, which excites unwonted interest in France, and indeed throughout Europe, has been got together for the purpose of aiding the fugitives from Alsace and Lorraine in the project of planting a colony in Algeria. Among the contributors are the Duke of Aumale, the Count and Countess of Paris, the Duke of Chartres, the Duke of Broglie, Count Haussenville, several members of the Rothschild family, and MM. Thiers, Lebarte, Gérôme, Hébert, Viardot, Wilson, with many others. Our English collectors have long been accustomed to place their treasures upon loan for the pleasure and instruction of the public; but French connoisseurs have hitherto shown a reserve in this respect which, on the present exceptional occasion, enhances the value of their favours. It is pleasant to find after the spoliation and impoverishment of France over a period of well nigh a century how much art treasure remains intact in private hands. It is true that events which denuded France enriched England; it is evident, for instance, that it might be possible to get together a finer collection of Sèvres China in London than in Paris; but seldom have we seen in any capital of Europe such rare examples of enamels, Henri-Deux ware, and tapestries. The collection of *faïences françaises* generally is good; there are some choice classic and early Christian ivories; and the examples of the French school of painting are also remarkable for number and excellence. In fine, this exhibition at the Palace of the President of the Legislative Body may be compared to a union, were it possible, of the British Institution with the Loan Exhibition of 1862. We must content ourselves with a general description of the works best worth notice.

The pictures, as usual, excite most interest, though, with the exception of those of the French school, they are of less value than the general *objets d'art*. The gem of the collection is "*La Vierge d'Orléans*," by Raffaele, lent by the Duke of Aumale. The other examples of the Italian schools are, with few exceptions, either doubtful or second-rate; in such dubious or inferior category may safely be placed "*Saint-Antoine tourmenté par les démons*," by Michael Angelo; "*La Sainte Famille*," by Fra Angelico; another "*Sainte Famille*" by Giovanni Bellini, and a couple of portraits by Velasquez. We may mention that, according to the usual custom in loan exhibitions, the directors have felt it their duty to adopt without question the names and descriptions given by the owners; thus a *portrait d'homme* is entered under Antonello da Messina, although Messrs. Crowe and Cavalcaselle expressly say:—"This beautiful and delicate piece is not by Antonello, but by Andrea Solario." The same historians give credence to a picture of undoubtedly high quality—"The Virgin seated on a throne, holding the Infant on her knee"—in the collection of M. Reiset, which is ascribed to the rare painter Zagarelli da Cotignola. We notice that from Beckford's Fonthill collection comes an "*Infant Christ*," by Luini. On the whole, there is little sign in France of the archaeological tendencies—the reversion to early historic periods—which have so strongly prevailed in England, as exemplified in the National Gallery, and in the collections of Earl Dudley, Mr. Fuller Maitland, and the late Mr. Barker.

The Dutch masters are better represented than the Italian. Of first-rate quality is "*Plage de Scheveningen*," by Ruysdael, from the collection of the Duke of Aumale, and of no less merit are "*Chevaux au pâturage*," by Paul Potter, lent by Count Henri de Greffulhe, and "*Paysage*," by Wynants, formerly in the Galerie Dellessert. There are also two portraits by Antonio More, from the collection of the Countess Duchâtel, which are of an excellence that would be exceptional even in England. Likewise may be observed a few first-rate examples of Netscher, Van der Meer, and Van der Heyden. The works we have enumerated are on an equality with the pictures in the Peol collection.

But beyond doubt the strength of these Galleries lies in the never-to-be-forgotten collection of the French school, especially in what may be called its Orleans period, embracing Ingres, Horace Vernet, Delacroix, Delacroix, Decamps, Cogniet, Ary Scheffer, and others. Yet the history of the school is carried back to its earlier years in the time of Francis I. by an exquisite portrait of his Queen Claude from the pencil of the Court painter, François Clouet. The eighteenth century, that fanciful and frivolous epoch which shows itself supremely blatant in the Hertford collection, is here also conspicuous in Boucher, Watteau, Lancret, Fragonard, Pater, and Greuze, artists who show their best as well as their worst in a total of sixty-four works, of which no less than twenty-five come from the prolific and sensuous pencil of Greuze. "*Reading the Bible*," formerly in the Galerie Dellessert, is a favourable example of the soft sentimentality to which the artist could surrender himself when he affected to be serious or semi-

religious. The whole of this art was, like the social and political condition, false and far removed from nature. The art, in common with the surrounding structure, fell, and then followed the usual interregnum, or rather anarchy. Thus in these Galleries we read the chequered story of a nation's history.

The collection of portraits is in all points remarkable, sometimes in artistic worth, always for the sake of history. As often happens, especially in periods of decadence or corruption, a painter does not go far wrong as long as he sticks to portraiture. The likenesses of the reigning houses are remarkable. We have already mentioned Clouet's admirable head of the Queen of Francis I.; then, by Rigaud, comes a portrait of Louis XV. as a child, and, by Greuze, a portrait of Louis XVI., also when young. In every way worthy of attention are also the varied versions of Marie Antoinette, from the pearly days when, in the rapturous words of Edmund Burke, she lighted on this orb as a delightful vision, "glittering like the morning star, full of life, splendour, and joy," down to the hours of her imprisonment in the Temple. Amid all change the same face reigns supreme, proud and fascinating, even in humiliation and calamity. The Napoleon dynasty is permitted to assert itself through "*Le roi de Rome*," by Gérard; "*Napoléon I^{er} le soir de Waterloo*," by Charlet; "*1814—retreat in snow*—by M. Meissonier; and a sketch for the famous "*Apothéose de Napoléon I^{er}*," by Ingres. The Orleans dynasty, the living representatives of which are leading promoters of the Exhibition, is kept unostentatiously in the background; the only portrait of the family which we can recall is that of the late Duke of Orleans, by Ingres, contributed by the Count of Paris. In these Galleries we find the retrospective record of the clear intellect, the sparkling wit, the beauty, and the grace which have ever shone in the French character. Here are portraits of François Arago and of Lamennais by Ary Scheffer, of Mme. de Staël and of Mlle. Récamier by Gérard. And from the remarkable "*Collection de la Comédie Française*" comes the portrait of Molière, in the character of Cæsar, by Mignard, while, among other theatrical celebrities, stand conspicuous Mlle. Georges, Mars, and Duchenois. It is evident that the French possess ample materials, both in point of subject and of art, for making a rich Historic Portrait Gallery.

We have seldom, if ever, seen a collection more honourable to that great epoch in the French school which, on the overthrow of David and the classicists, began with Géricault and ended with Delacroix and Delaroche. Here is a vigorous sketch in oils for Géricault's masterpiece in the Louvre, "*The Wreck of the Medusa*," a prodigy of dramatic power which annihilated cold classicism and fired the art of the half-century which followed with the action and passion of nature. The chief exceptions to the Romantic style, which thenceforth held sway, are found in the severity of Ingres and the pale placidity of Ary Scheffer—two honoured masters here seen at their best. Scarcely could we name since the days of Raffaele anything more mature in typical form or more exquisite in the flow of harmonious lines than the "*Vénus Anadyomène*" and the "*Odalisque*," by Ingres, and the nineteenth century cannot show anything more noble or grandly imaginative than Ary Scheffer's "*Roi de Thule*" and "*Françoise de Rimini*," both from the collection of Mme. Marjolin-Scheffer. Paul Delaroche, who occupies an intermediate place between the sober and stately Academic style on the one side, and the more lawless school of romance and of colour on the other, is seen to advantage in his historic character in "*L'assassinat du duc de Guise*," from the collection of the Duke of Aumale. Delaroche also had religious phases, especially at times when he threw the shadow of his melancholy over scenes of the Passion Week; there scarcely exist in Christian art works more true or pathetic than "*L'évanouissement de la Vierge*" and "*Le retour du Golgotha*"—both belonging to M. Delaroche-Vernet. The leader of the opposite party, Delacroix, the Titian, or rather the Rubens of Paris, who rushed in hot haste into a colour which confounded form, is fairly well seen in "*Cleopâtre*," and in a sketch for "*L'entrée des Croisés à Constantinople*"; the last belongs to the Duke of Aumale. But Decamps is the genius who asserts most power; we have not seen this supremely creative painter in equal versatility or originality since the International Exhibition in the Champs-Élysées in 1857. Specially grand are the nine designs then, and here again, exhibited from the history of Samson; the figures might almost be from the hand of Michael Angelo, and the accessory landscapes by Salvator Rosa. It is but too evident whence M. Gustave Doré has taken some of his most thrilling thoughts. But Decamps did something better than revel in the riot of ungovernable fancy; by the fling of his hand, by the impetuous sweep of his pencil, by his range through boundless space, by the grandeur of his forms and the terror of his shadows, he brought into his wild creations the sense of the supernatural.

Among the miscellaneous collections the rarest treasures are eighteen specimens of Henri-Deux ware, a very large proportion of the total number of existing examples. Of these the Baroness de Rothschild lends a *tazza* of elegant form, Baron Gustave de Rothschild six pieces, some of which are of the finest possible quality, and Baron Alphonse de Rothschild seven specimens, of which the "*biberon*" is almost unexampled for size, design, and workmanship. It is instructive to observe how unequal in art merit are these eighteen examples of a manufacture which, notwithstanding much research, is still clouded in mystery; some are left absolutely unfinished, miniature cornices and other members being moulded simply in the mass; again, while certain specimens are almost faultless in the combination of architectural structure, of the figure and of surface decoration, others fall into a confused

hodge-podge. Differences may also be observed as to states of preservation; thus while a few specimens remain without chip or reparation, others show figures wanting heads or surfaces which have been painted over. It were vain to conjecture the number of thousands of pounds sterling which this almost unexamined assemblage would fetch, especially when we remember the sum at which Mr. Malcolm acquired perhaps the finest specimen we possess in England. The reconsideration which we have been able to give in Paris to this truly unique ware inclines to the conclusion that the extravagant prices now reached are scarcely in excess of its very exceptional art merit.

Another art fabric in which France stands supreme—that of enamel-work—is also here exemplified almost exhaustively. There are triptychs in champlevé as early as the twelfth century; also to the same period belong two remarkable figures of St. Paul and St. Thomas, richly decorated with enamel. The later and more pictorial styles of Limoges, the grey as well as the coloured, are represented by superb specimens; and it would indeed be sad if France had found herself denuded of art products of which she may be justly proud. Palissy ware is not so obtrusive as might have been feared, and we gladly encounter, instead of frogs, snails, and serpents, “*La nymphe de Fontainebleau sous les traits de Diane de Poitiers*”; the figure is here treated with a severity and command for which we had scarcely given Bernard Palissy credit. Tapestries, as might be expected in France, abound. Among many others we may mention a Gothic triptych of the fifteenth century, highly elaborated as an easel picture, and representing Christ crowned by the Virgin, with attendant angels and accessory fountains and flowers. The whole work is extremely beautiful. The art of illumination, in which France also takes a lead, finds an early commencement in the “*Évangélaire latin de l’abbaye de Luxeuil*”; manuscript du XI^e siècle, avec miniatures”—style rude Byzantine, colours pale on gold ground; also of great archeological value are the “*Commentaires sur l’Apocalypse de San Beato*”; manuscript du XII^e siècle; école d’Aquitaine”; the figures, on a blue ground, are lower in character than in the contemporaneous mosaics of Italy. Likewise as an important link in this Gallic school follows “*Une miniature sur vélin par Jean Fouquet*,” painter to Louis XI. How consummate was the art of Fouquet may be seen at Frankfurt in a private collection which no traveller should fail to visit.

With increased interest and appreciation we renewed acquaintance with the works of the deeply lamented Princess Mary of Orleans, who, though in some sense not more than an amateur, ranks, we incline to think, as the first female sculptor the world has yet seen. “*Jeanne d’Arc*,” “*Chasse au faucon*,” and “*l’Amazone au lévrier*,” all in bronze, are compositions which in any country and in any time would assert their title to a place in the first rank for originality in conception and mastery in treatment. The Orleansists have reason to be satisfied with the position which the present Exhibition gives them. It becomes apparent that around them gathered the best art talent of France.

REVIEWS.

STUBBS'S CONSTITUTIONAL HISTORY.*

IT is not without truth that Professor Stubbs begins his great task by saying that “the History of Institutions cannot be mastered—can scarcely be approached—without an effort.” To write his present volume must have been work in the truest and highest sense, and to read it is not exactly play. We sometimes see books advertised “for summer reading” or “for seaside reading,” formulae which always remind us of those Roman knights who had lighter rings for summer wear and heavier for winter. Those who draw a distinction between their summer and their winter reading will, we suspect, not venture upon Mr. Stubbs in the summer, if they even venture upon him at all. To the scholar his work will be equally welcome in summer or winter or any other season. Still to master such a thick-set mass of knowledge and thought does call for an effort. But Mr. Stubbs doubtless only writes for those who are ready to make an effort, and those who do make it will be rewarded by admission to such a storehouse of knowledge as has never been thrown open to Englishmen before.

Mr. Stubbs's work at once supplies us with an answer to the charge brought by Dr. Gneist against English scholars, that they do not attempt to grapple with their own constitutional history in any connected and scientific way, but treat it only piecemeal, in what he calls an antiquarian fashion. Here at last we have the thing done in a way as thorough and systematic as anything that any of Dr. Gneist's own countrymen could send forth. Mr. Stubbs has the same wide and close grasp of his subject which we see in the best German writers, and he may set Dr. Gneist a lesson in that minute accuracy of statement and reference which the Berlin Professor is very far from having reached himself. We would rather compare the native constitutional historian of England with the native constitutional historian of Germany. We have here a worthy companion-piece to the great *Deutsche Verfassungsgeschichte* of Waitz. Thus far Oxford and Göttingen may be content to walk together as equal yoke-fellows. It would be

painful to our insular feelings to carry the comparison further. The Worthies of All Souls would hardly, for their own sakes, wish to be matched against the continuation of Lappenberg and the monograph on Earl Simon. We have indeed the small comfort of thinking that the second Göttingen Professor does not belong to Göttingen only. If we must give up ten parts in Dr. Pauli to his own land, it is something that Oxford and Edinburgh may each fairly claim one part in him.

The work of Mr. Stubbs is the first Constitutional History of England, at once minute and continuous, which has been undertaken since a wholly new light has been thrown upon matters of this kind by the researches of the great German writers, Waitz, the two Maurers, and others. In his view, the growth of English institutions is not a mere isolated thing, something confined within the bounds of our own island, something for English antiquaries or English lawyers to make guesses at, without getting beyond their own narrow range. In his view, it is part of the great story of the development of Teutonic institutions. The further relations between Teutonic institutions and the institutions of other Aryan races he was perhaps, in a work strictly historical, hardly called on to enter upon at any length. It shows the millenniums through which we seem to have lived in point of historical insight within a very few generations, if we compare the fulness, the scientific precision, the wide comparative grasp, of the opening chapters of Mr. Stubbs's History with the childish talk of Blackstone or even with the meagreness of Hallam. It is no disrespect to those who doubtless did their best according to their light, to mark how very much more light has come among us within a very short time. Of course the time between Hallam and Stubbs is bridged over by two great writers; but the learning and genius of Sir Francis Palgrave were constantly warped by his strange and one-sided theories; and Mr. Kemble, who was the first to open to Englishmen the results of German scientific research, had no great gift of exposition; he deals with things in an unconnected kind of way, and after all his work covers only a few centuries at the beginning of our constitutional history. Mr. Stubbs, for the first time, gives us the unbroken history of our constitutional development, from the first notices of German institutions in Cæsar down to the Great Charter of John. Of course at this time of day Mr. Stubbs does not stoop to argue that English institutions are Teutonic. There are others whose business it is to expose fictions; he has simply to deal with facts. But it is well to remember, what comes out most strongly in his opening chapter, that the political origin of institutions and the ethnological origin of the people among whom those institutions grow up are questions which are really quite distinct. Thus, in Mr. Stubbs's point of view, France and Spain are Teutonic countries hardly less than Germany and England. At first sight this seems startling because, from the point of view of language and from the point of view of blood, the Teutonic element in France and Spain is merely a small infusion. But Mr. Stubbs, from his point of view, is right in placing France and Spain in the Teutonic group, just as a philological writer is right in placing them in the Romance group, while a writer who dealt mainly with the actual races of men, and not with either their institutions or their languages, would be no less right in placing over Romans and Teutons to get back to Celts and Iberians. The prevailing blood in France is undoubtedly Celtic; the language is Latin modified by the circumstances of a Teutonic conquest; but when we come to the political institutions and the consequent political history, the precedence of the elements is reversed. While we have a Latin language modified by Teutonic influences, we have a Teutonic polity modified by Latin and Gaulish influences, modified by the circumstances of a Teutonic settlement in a Gaulish province of Rome. Mr. Stubbs accordingly starts by classing together Germany, England, France, and Spain as the four countries where the history of Teutonic institutions under four different sets of circumstances has to be studied, and he does not scruple to fix upon England rather than Germany itself as the country where the original Teutonic elements have had the freest ground for growing into a national polity. In England the tendency has always been to unity, to the fusing together of the various kindred tribes and their kindred, but not identical, local institutions. In Germany, on the other hand, a number of causes, above all the annexation of the Crown of the Empire to that of the German kingdom, the “Mezentian union with Italy,” as Mr. Stubbs calls it, gave a less national character to the central monarchy, lessened its strength while exalting its dignity, and tended, not to fusion, but to separation among the several parts of the nation. In this way he traces out the chief points of difference as well as of likeness in the course which institutions that started from the same point have run in different countries. But, whether among those who tarried in the old land, among those who settled in the midst of conquered Roman provincials, or among those who made for themselves a new home by sweeping away all traces of the Roman and his subjects, the institutions of all alike spring from one common source, and to that source our present teacher traces them up in a way which must be perfectly clear to every one who has eyes to see anything at all. Never was the true Teutonic character of the English nation and its institutions more fully and clearly put forth than it is by Mr. Stubbs. Yet we could almost wish that he did not so often use the word “German” in a general sense. To most minds the word “German” conveys the meaning of something distinctively High-Dutch, and its use, as applied to anything English, always calls up a crowd of shallow objections from people who have not learned the difference between High and Low. Mr. Stubbs would probably answer that he writes, not for fools, but for

* *The Constitutional History of England in its Origin and Development.* By William Stubbs, M.A. Vol. I. Oxford: at the Clarendon Press. 1874.

wise men, that he assumes that people have mastered obvious truths before they enter on that deeper research to which his volume is the best guide. Still it is always better to avoid giving any occasion for misconception, and it would also have been better if, in dealing with our earliest times, he had kept to the true name "English," which he uses almost alternately with the misleading "Anglo-Saxon." Nothing is plainer than that there is not a jot of confusion in Mr. Stubbs's own mind; but men of his class are sometimes tempted to forget that phrases which they can themselves use without confusion often lead to confusion in the minds of their readers; and that, though they may write for the wise only, their books often fall into the hands of those who are not wise.

The book is, in short, a masterpiece; it is the carrying out in minute detail of what the author had already traced out in the various sketches and summaries attached to the Select Charters. It is brimful of all the knowledge on the subject scientifically treated and orderly arranged. Yet it cannot be denied that it is stiff reading; it reads more like a German than an English book. That the stiffness is in the subject and not in the writer is plain to every one who remembers the easy flow of Mr. Stubbs's personal portraits in his various prefaces and of the commentaries on the Select Charters. It is the necessary result of cramming such a gigantic mass of thought and knowledge into so narrow a compass. We have heard it said, and with perfect truth, that Mr. Stubbs's book is not nearly so easy to read as Hallam's. The cause is obvious. Mr. Stubbs has about ten times as much to tell as Hallam had. And, during this part of his work, Mr. Stubbs has the great advantage of not being a lawyer; for at this stage it is an advantage, though at a later stage the gain is on the other side. We will not say that no lawyer can write early history, because there are men in every profession who can rise above the trammels of that profession; but, down at least to the reign of Edward the First, the technical lore of the lawyer is distinctly a hindrance. It is a hindrance, because it supplies the temptation, which only a very independent mind can overcome, to carry back existing rules and existing institutions to a time before their own date, and, instead of the facts of the case, to substitute a mass of arbitrary legal fictions. The two ideals of the mere lawyer are the king and the lord of the manor. Because the king and the lord of the manor have played a most important part for many ages, he carries them back into times when the lord had no existence at all, and when the king was quite another person from what he became in the days to which lawyers' notions apply. As long as any man has the notion in his head that there has been an hereditary king from all eternity, and an hereditary lord of the manor from a time only so far short of eternity as to allow the king time to make him a grant, the development or corruption of the institutions once common to the whole race can never be understood. What the lawyer, when he looses himself from his trammels, may rise to, we may see in Sir Henry Maine; but where he has a natural tendency to abide we may see in Mr. Finlason. The great point is fully to take in that both the king and the lord are both of them, we will not say ungodly men, but certainly men who have crept in unawares, and that the lord has crept in at a comparatively late time. The gradual changes by which the system which we see after the Norman Conquest was worked out of the older English institutions—that is, the common Teutonic institutions—the Norman Conquest itself bringing comparatively little that was absolutely new, but strengthening and hastening tendencies which were already at work, are now traced out in a way in which they have never been traced out before. No one has hitherto tried in the same systematic way to compare the institutions of the two periods, and to show the steps by which one changed into the other. On the growth of manors Mr. Stubbs has perhaps thrown as much light as can be thrown, but the thing is inherently obscure in itself. It is almost in the nature of things that it should be so, as the change from the free community to the lordship was the result, not of any legislative act, not of any one great event, but of a gradual process of whose stages no record was likely to be kept. But it is plain that here too the Norman Conquest only put the finishing stroke to a process which was already at work. The grants of *sac* and *soc* and the like, answering to the *emunitatem* of the German writers, gradually undermined the old local institutions, but in England at least they never wholly destroyed them. Notwithstanding all changes, the old local institutions went on growing into new forms and adapting themselves to new states of things. Meanwhile the royal power was strengthening, and the Norman kings brought in, not indeed a new constitution, but a new and more vigorous system of administration. The relation of the old and new elements to one another is set forth by Mr. Stubbs in a remarkable passage, one clause of which however might have been the better if some other word could have been found for "organism":—

The principle of amalgamating the two laws and nationalities by superimposing the better consolidated Norman superstructure on the better consolidated English substructure runs through the whole policy. The English system was strong in the cohesion of its lower organism, the association of individuals in the township, in the hundred, and in the shire; the Norman race was strong in its higher ranges, in the close relation to the Crown of the tenants in chief whom the king had enriched. On the other hand, the English system was weak in the higher organization, and the Normans in England had hardly any subordinate organization at all. The strongest elements of both were brought together.

What more than anything else distinguishes the newer system from the older is the fiscal spirit which reigns through the whole

Norman administration. The great aim and object of everything is to get money for the king. But while this led to a large amount of oppression, on the other hand it fostered the growth of an administrative system which might be used for other purposes, and it also called forth that spirit of resistance to oppressive demands which became the soul of later English freedom. All this Mr. Stubbs works out with wonderful care and minuteness. His former studies in the early Angevin reigns have made him better able to deal with this branch of his subject than any other man. Elsewhere he has given us living personal portraits of the men themselves; here he has discharged a far harder task, both of minutely tracing out their system of government, and showing what it sprang out of, and what it grew into. Some special points illustrating the way in which Mr. Stubbs deals with the great questions which his subject suggests we must keep for another notice.

A GENEVESE POET.*

AMONGST other results of modern centralization may be reckoned the gradual extinction of various minor literary capitals which flourished in provincial towns during the last century. Edinburgh in the days of Hume, Adam Smith, and Scott could often stand a comparison with London. Though perhaps it has not entirely lost its glory, the most distinguished Scotchmen of the present day have shown a disposition to leave their native country which would have startled even Johnson. The Universities and the Church induce some eminent writers to resist the general centripetal tendency; but London undoubtedly tends to attract to itself a larger proportion of talent in this as in most other professions. The same tendency naturally manifests itself in French literature. Geneva has been the birthplace of many eminent men and the dwelling-place of many others. It is enough to mention the names of Rousseau and Saussure to prove that in the eighteenth century the intellect of Geneva could influence France and the world. At the present day the glories of Calvin's city have become rather faded; and though Geneva has in more than one way an importance disproportionate to the numbers of its population, it can hardly be regarded as a great centre of literary activity. We have indeed seen a collection of poems by recent Genevese writers which shows that a certain fashion of verse-writing still survives, or was recently alive, though, to say the truth, the performers seem to deserve credit rather for a polite accomplishment than for much original genius. There are, however, two residents at Geneva whose reputation is of a higher order. One is M. Victor Cherbuliez, whose last novel, *Mlle Holdemé*, was lately reviewed in these columns; and the other is M. Marc Monnier, a well-known political writer, who lives at Geneva, though we believe that he is by birth a Frenchman. He has recently published a rather ambitious poem, of which we shall presently speak; but he was previously known as the author of some very clever pieces of playful satire, to which it is not easy to find an exact parallel in English literature. We may perhaps say that, if *Dame Europe's School* had been written in witty verse, it might have passed for an imitation of M. Marc Monnier. Some of his comedies have been collected under the title of *Théâtre de Marionnettes*; they are, in fact, in the form of plays, but such as, if we could suppose them to be acted upon any stage, would be most suitable to a company of puppets. The form, however, is merely chosen as the most convenient vehicle for light, though often telling, satire upon contemporary politics. The motto prefixed to his last performance, which refers to the German war, is sufficiently significant:—

Le Français a l'esprit moqueur
Même quand il n'est pas en fête,
Et vaincu, se rit du vainqueur,
Qui sera toujours le plus bête.

Upon M. Marc Monnier has fallen some corner of the mantle of his great neighbour Voltaire, who would have fully appreciated and heartily enjoyed some of the strokes of wit aimed at the successor of the great Frederick. The satire, indeed, was sufficiently keen to excite the susceptibility of French officials. In a piece published in 1865 one of the speakers proclaims an Encyclical; he announces

Que le froc a des parfums d'ambre,
Que le printemps vient en décembre,
Que la paix règne entre les rois;
Enfin que deux et deux font trois;

and adds, that if anybody chooses to say on the contrary,

Que le froc sent mauvais parfois,
Que décembre est un vilain mois,

or that two and two make four, he will be sent, as the Pope in the *Ingoldby Legends* expresses it, "where good manners won't let me tell." An unlucky writer quoted these lines in a French newspaper, and was punished by a fine of a thousand francs and imprisonment for three months.

The authorities under the Imperial Government held that a disagreeable allusion was concealed in the reference to December. We have a natural objection in England to such modes of restraining the liberty of the press, but we may allow that they have one advantage. Satire which has to evade such scrutiny must be very dexterously smuggled into verse; and though M. Marc

* *Théâtre de Marionnettes*. Par Marc Monnier. Geneva: 1871.
Vie de Jésus: racontée en vers français. Par Marc Monnier. Paris: 1874.

Monnier has the advantage of living at Geneva, he has that delicacy in the use of his weapons which has been fostered amongst Frenchmen by constant practice in "saying everything where nothing is allowed to be said." His touch is light; and though his meaning is generally clear enough, he can be cutting without being brutal, and has the air of being most playful when he is saying the most serious things. In short, he has that happy French art which is most wanting in our rough English satire, and which it is scarcely possible to describe adequately without using words borrowed from the French themselves. We can feel the difference between "chaff" and persiflage; or between the faculty which we describe when we say that a writer is witty and that which is implied by the epithet *spirituel*. If we did not recognize the difference, M. Marc Monnier, as compared with any ordinary English political satirist, would supply an excellent illustration of its meaning. We may, however, best give some notion of his writing by taking one of his most recent performances, the meaning of which requires no Daniel as an interpreter. It is a new version of *Faust*, which opens with a parody of the familiar scene in heaven. Mephistopheles appears before Providence, who has been allowing the world to get into considerable disorder, and makes a bet that he will seduce Faust in three days. Faust is a good German, much in the habit of praying to Providence, and with a fine collection of sticks, whips, canes, and clubs ready for use in a good cause. Mephistopheles introduces himself according to precedent, and induces Faust and his friend Kaiserlich to attack poor Hamlet the Dane, who has become a very peaceable, quiet person since Shakespeare's time. Malbrouc looks out of his window and remarks to Sabre-de-bois that a row is taking place. "Je crois," says Sabre-de-bois, at his door—

Je crois qu'on dévalise Hamlet.

MALBROUC.

Ils sont deux contre un, les Vandales.

SABREDEBOIS.

Et lui soutirent les sandales.

MALBROUC.

Pour châtier ces deux poultrous—

SABREDEBOIS.

Corbleu !

MALBROUC.

Rentrons chez nous !

SABREDEBOIS.

Rentron ! (Ils rentrent.)

We need not describe at length how Mephistopheles presently makes friends with the Italian Machiavelli; how the two together fall upon poor Kaiserlich and strip him; how Mephistopheles contrives to humbug Sabre-de-bois into looking on without interference, and afterwards tricks him into insulting Faust. Mephistopheles has a very simple system; he always plays with his cards on the table, and announces his worst plans beforehand :—

Quand j'ai quelque infamie à faire,
Je l'annonce à chaque hémi-sphère ;
Les badauds, pensant que je mens,
Ne gênent pas mes mouvements ;
C'est ainsi que je les dépouille,
Et quand plus tard ils chantent poultrous,
Je leur réponds : Mes bons amis,
Ne vous l'avais-je pas promis ?

Finally, Sabre-de-bois is thoroughly beaten, and Marguerite, an innocent peasant girl, who lives, we should suppose, somewhere near the Rhine, is carried off by Faust. Malbrouc contents himself with a modest protest; Mephistopheles argues that he has won his wager and made out Faust a robber, murderer, and ravisher. Providence asks Faust to which power he belongs, and Faust humbly replies, "Je suis à toi, ma Providence !" Mephistopheles concludes, "Maintenant tirez le rideau !" and the little play concludes for the present. The puppets have said their say smartly enough; and even people who take a rather different view of the true character of Mephistopheles, Faust, and Sabre-de-bois, may admit that they have interpreted the French view of recent history with abundant ingenuity and epigrammatic vigour.

The series of Marionnette comedies goes as far back as the American war; and we may presume that M. Marc Monnier's adherence to this method of uttering his feelings shows that it is natural to him, and has been appreciated by his readers. The other poem to which we have referred is as odd a contrast as can well be imagined; but French gallantry is equal to anything. The author of a *Théâtre de Marionnettes* might be supposed to be an ingrained satirist, and to be likely to take the cynical view of most subjects of human thought. We might naturally fear that one who inherits so much of the Voltaire spirit would treat the *Vie de Jésus* in a manner not precisely edifying to ordinary Englishmen. The very notion of transferring the Gospels into French verse has something rather startling to our minds; and M. Marc Monnier's antecedents would scarcely suggest that he was the fittest man for the task. We cannot, indeed, conscientiously say that the book is likely to be an edifying one to English readers. For most purposes, we may venture to say, we prefer to read the original documents or the most literal translation obtainable. Some writers have obviously been under the impression that they could materially improve upon the originals. We have more than once had the misfortune of reading sermons and treatises in which the simple language of the Gospels has been overlaid with a mass of rhetorical verbiage which to our minds has been simply disgusting. Milton has of course given a precedent for expanding hints given in the Scriptures into magnificent poetry. Whether

Milton would have chosen such a theme if he had lived at the present day is a question which would admit of some argument; but at least we should be induced to say that nobody ought to do it who is not conscious that he is a worthy rival of Milton's, without deciding whether, even in that case, he might not employ his genius for a better purpose. At any rate we must confess that M. Marc Monnier's performance is only noticeable by us as a literary curiosity. There is indeed no sign of intentional irreverence in his writing. He has altered the text as little as possible; most of his poetry is simply taken from the words of the original, altered as little as is compatible with presenting them in a French dress. Everybody who has been brought up under the influence of the English regard for even the letter of the Bible is probably conscious of a slight, and of course utterly irrational, shock when he reads for the first time even a literal prose translation of the Gospels into a modern foreign language. He has associations with words which sometimes strike him rather oddly when used in a sacred connexion. Of course a little reflection dissipates the sense of incongruity in this case; but it does not vanish quite so quickly when he sees the familiar phrases forced into the French heroic metre, especially if he has shared the ordinary English distaste for most French poetry. The difficulty of fairly criticizing the work of M. Marc Monnier is therefore so great that we must decline the task; and will simply leave our readers to judge for themselves from a fragment, which we select because it is short, and because there is nothing in it which can jar unnecessarily upon even an unreasoning instinct of reverence. Here is a version of a few verses :—

Les disciples parfois avaient l'âme jalouse.
Comme chez eux plus d'un se croyait le plus grand,
Et qu'ils se disputaient entre eux le premier rang,
Jésus prit un enfant qu'il mit entre les douze :
"Voilà ceux," leur dit-il, "que j'aime et je défends ;
Le royaume du ciel est à qui leur ressemble,
Hommes, soyez comme eux. Laissez venir ensemble,
Laissez venir à moi les plus petits enfants !"

If anybody likes to read the Gospels in this form, he may find them all done into beautifully printed and fluent verse in M. Marc Monnier's version.

THE COUNT OF PARIS'S HISTORY OF THE AMERICAN WAR.*

(Second Notice.)

IN a former notice we have given unqualified praise to that preliminary part of this work which undertakes to trace the growth of the American army of 1861-65 from its early germs in the provincial militia battalions that fought so gallantly in the Seven Years' War. As we then pointed out, it has been a great deal too much the fashion in Europe to treat the levies which served the cause of the Union as though they were some perfectly new creation, instead of being but a revival on a grand scale of the volunteer forces of former American contests. In truth, the system which produced the hardy troops who aided the British regulars to wrest the dominion of North America from the French, and who not long after drove the same regulars from point after point until they lost all hold on the Thirteen Colonies, was not dead during long terms of peace, but merely slumbering. The same free, active, adventurous spirit was forthcoming at the later crisis as in the earlier. No doubt it was burlesqued by the comical "loafers" of the Atlantic cities, who showed all the rudeness of the early settler without his virtues. But, viewed as a mass, the raw material was almost as tough in the days of Bull Run, panics notwithstanding, as in those of Brandywine, and, with all the faults that were so prominent to the professional observer, it had by instinct an individual power and readiness which, under certain circumstances, and on its own ground, would have made it more formidable than the best-trained soldiers of Europe. The fact that this was so, and the reasons why it was so, are themes that have never been thoroughly handled before the Count of Paris undertook them, and there is not a word to be said against his execution of this part of his great task.

But it would have been well, we are bound to say, if he had confined himself to the purely military treatment of his subject; for the philosophic breadth with which he reviews American warfare suddenly vanishes when he comes to the more difficult subject of American politics. In one of his introductory chapters, "L'Esclavage," he undertakes to do for the origin of the great struggle what he had previously done for that of the Union army that engaged in it; and the very title shows that he approaches the subject with such a prejudiced view that his judgment is no longer to be trusted. Of course any writer has an easy task who undertakes to prove that the dreadful contest of 1861 would not have broken out when it did, nor the combatants have been spurred with the same fierceness of passion, had not the slave-holding States risen against the Union avowedly to maintain their cherished institution. But when this is said, and when the features of a slave-holding Republic, confessedly to be maintained as such, are painted in the darkest colours and denounced in the best set terms, the whole difficulty is by no means disposed of. The historian who would really exhaust the question must go back to the foundation of the Union. He must not only ask, but answer, such questions as—

* *Histoire de la guerre civile en Amérique*. Par M. le Comte de Paris, ancien aide-de-camp du général Mac-Clélan. Tome I et 2. Paris : Lévy, 1874.

Who was it that could have prevented this struggle coming on in course of time? Where is the exact point to be fixed at which the victorious Virginian patriot who owned slaves under Jefferson became the enemy of mankind for adhering to the system of slavery in the days of Lincoln? Whose fault was it that the founders of the Union evaded the settlement of the question which afterwards grew into violent disruption, and even prepared the way for this disruption by leaving the right to secede a subject untouched by the Constitution? The fact is that to any one who views the history of the United States down to 1860, apart from any preconceived views on the subject of slavery or of secession, it is sufficiently apparent that the former, once suffered legally to grow within a section, must inevitably at some time or other have led to the latter, and that the right to secede in order to protect her property and her hitherto recognized rights was one which could only be disproved to the South by the arbitrament of the sword, in default of any power sufficiently wise and despotic to settle the matter peacefully. But to see this, and to say it plainly, is neither to condemn nor to justify slavery in the abstract. It is simply to assert that the Union was originally imposed by circumstances on such diverse elements as could not be for ever retained together by any peaceable means. In view of the interests of humanity the solution brought by the war may have been a just and happy one; but, as regards the contending parties, there could really be no more guilt on the one side than on the other, since each was but doing that which the conditions imposed on it by inheritance compelled it to do. We have gone out of our way to say this, because the declarations of the Count of Paris in his slavery chapter add not one word of novelty to the stock Union arguments framed after Union had become identified with Abolition. And he ignores the broad fact that President Lincoln himself, though elected to serve anti-slavery purposes, declared over and over again, long after the war was fairly begun, that it was waged for Union and not for Abolition; in other words, the crime of the slaveholders was not that they were what their ancestry and laws had made them, but that, being slaveholders, they revolted against a Government which was framed originally to protect all the inner economy of every member of the Union, but was gradually becoming, as they had cause to fear, more and more onesided against the South, and more and more able to give weight to its partiality.

We are sorry to be compelled to go on and observe that the Count's political feelings on this subject have influenced his treatment of that part of his military matter which deals with the framework of the Confederate army. Thus we find him making it a sort of crime on the part of the Southerners that the minority amongst them who dreaded parting from the banner of the Union were reduced to silence by the violence of the dominant party. No doubt they were. But it is certainly not less matter of history, to put it mildly, that New York mobs brought over the reluctant members of the press in that city to the Union side by a kind of pressure not a whit more constitutional than the revolutionary Committees which the Count (on very doubtful authority, as we think) builds up all over the South to carry on the process of political conversion. Here again, so far as the facts are really ascertained, each side pursued the same end with whatever means came to hand. Nations cannot make war effectively whilst parties within them denounce the whole proceeding as an iniquity, and they instinctively discover this as soon as the work is seriously entered on. We know no authority higher than that of the second-hand gossip of the *Tribune* for such stories as the Count gives of Unionists in the South condemned to instant death, "round the bar on which gin and whisky were flowing, whilst violent men held judgment on their fellow-citizens." But we do know it for certain that a journal of New York in the April of that strange year, 1861, was praising the efforts made by the Charleston patriots to take Fort Sumter, and within three months later was thundering against the "Rebs" with all the zeal of a neophyte. Such conversions are too common in every revolution, and a philosophic writer is bound to explain rather than to condemn them, much less to suppose them limited to one party in a civil struggle.

But we must pass to the more strictly military part of this history, where we are able to speak with more pleasure of the author's labours. We purposely select that portion of which he was an eye-witness. Excellent is his account of the reorganization—if that can so be called which dealt with what hardly knew any organization before—of the beaten army of the North under MacClellan after Bull Run. A graphic yet truthful picture is here given of the immense difficulties which the new chief encountered at every turn, and more especially of the rude condition of the levies placed under his charge with what, according to European judgment, would have been utterly inadequate powers of military control. The difficulties met with in the ignorance and inexperience of his volunteer officers, the means taken to purge this body of its most incompetent members, and the despair of the rejected, "for besides the dishonour, it was a heavy pecuniary loss to them," are all admirably told. Indeed this whole chapter, "*Les Préparatifs de Combat*," can be studied in every page with both pleasure and profit. That the young Commander-in-Chief was able to do anything at all with such raw material is very justly explained as owing to a cause which has hitherto been little recognized on this side of the Atlantic—namely, to the high moral calibre of the men enlisted.

On the other hand [it is said, after reciting the difficulties] the intelligence and education which placed the greater part of the rank and file on a level

with their military superiors inspired them with a natural respect for those of their chiefs in whom they recognized the necessary qualities for commanding them, and caused them to accept without a murmur the obligations and restraints of a military life as soon as they were got to understand their necessity. Leaving to a few regiments, composed for the most part of European adventurers, the monopoly of insubordination, they had none of that turbulence which is often associated with the name of volunteer. A few warnings were sufficient to remind them that, the oath once taken, there were to be no more amateurs with the colours.

And our author goes on to narrate in detail the single instance which occurred of open resistance to MacClellan's authority. This took place in the streets of Washington itself, and was easily suppressed by a slight show of some regular troops that were at hand, the disobedient regiment promptly returning to its duty, and showing thereafter the most earnest desire to win back the flag which it had forfeited in its disgrace.

The Count was present during this whole period of preparation and apparent inaction, for he joined the army not long after its misfortune at Bull Run. His first volume closes at this point, and the second will be a disappointment to those who look to find in it the story of that particular campaign of MacClellan's in which he personally shared. It is devoted to other early portions of the war. The last chapter, however, under the title of "*Hamp-ton Roads*," treats of the final preparations for the great undertaking, and the difficulties which the General-in-Chief met with at the hands of the President in his design of carrying his army away from the vicinity of Washington by water, in order to attack Richmond the more easily. The plan of MacClellan in its details was ably conceived, as it is here very ably drawn. He would have left Washington protected by 22,000 recruits covered by the new works. Near it were to be 30,000 troops under Banks and the German general Blenker, half of whom were told off to guard the approach down to Shenandoah Valley, whilst the rest might be posted at Manassas, with the Washington works and garrison in second line. This was more, it is properly observed, than was required to protect the capital for the moment, until the coming danger of Richmond should draw the main Confederate army that way, when MacClellan had even proposed to detach Blenker's division into Western Virginia. With his own Army of the Potomac he was preparing to force his way up the Yorktown peninsula to the east side of the capital of the South. Finally, the reserve corps of MacDowell, containing 38,000 of the best trained of the volunteers, was to be moved suddenly in transports after MacClellan had actually fixed the attention of the defenders of Richmond, to turn the works which he would have before him.

The accomplishment of the task assigned to this corps was, in the eyes of General MacClellan, indispensable to insure rapid success in the campaign. But at the very moment that he was about to embark MacDowell received from the President the order to remain in the neighbourhood of Washington, and a laconic despatch told MacClellan that the troops he awaited so impatiently were withdrawn from his command. Since the operations had begun he was deprived of nearly a third of the army he had formed with such pains, and to the good organization of which he had sacrificed a part of his popularity. . . . It will be seen in the succeeding volume how dearly this fault was paid for.

With these words the Count closes the present instalment of his work, and prepares us to look with interest for its continuation. Of its merits as a military history we have already said much, and few readers will be found to dispute them. If there be any such, they will probably be persons who have as strong political prepossessions on the American question as the author himself, but who give their personal sympathy to the lost cause as warmly as his is bestowed on that of the victorious Union.

JOHNSON ON LANDSCAPE GARDENING.*

THIS book would be more useful if it were briefer and clearer as well as less didactic and theoretical. We have no doubt that its author would make less ado about pricking out a garden plan or levelling the side of a hillock than about constructing a sentence, or at any rate writing half a page. Feeling a high sense of the responsibility of authorship, he must needs consult the dignity and depth of his subject rather than the leisure of practical readers, and, having read Mr. Ruskin with individual profit, he is led to retail Ruskinism without its force. The result is naturally surplusage and vagueness, for hints on style and taste and arrangement repeat themselves with cumbersome solemnity, and a good many pages are taken up with dissertations on the beautiful and on love. But it is worth while occasionally to encounter all this for the sake of the valuable matter that lies beneath, and we can make allowance for unconscious haziness on paper in one who understands his art and can realize his ideas in practice. If we allow for this weakness, and for that other which seems common to the class of professional landscape-gardeners—namely, the conviction that an amateur cannot possibly do right or avoid ruinous mistakes if he follows the dictates of his own taste, or admits the suggestions of his own unaided eye—there will be found enough of sound truth and useful hints in Mr. Johnson's hundred and fifty pages to interest the curious and instruct the doubtful horticulturist.

We shall confine our remarks to the most practical chapters of the three books which make up the volume, and which discuss respectively beauty, laws of order, and principal effects and styles

* *The Natural Principles of Landscape Gardening*. By Joseph Forsyth Johnson, Curator of the Royal Botanic Gardens, Belfast. Printed for the Author by Archer & Sons, Belfast. 1874.

of scenery. In Ch. II. of the first book a good deal may be learned on the topic of "line and colour" which will stand the amateur in stead when he is planning the decoration of his beds. With trees, shrubs, and lower growths in the shape of carpeting plants and the like, colours, tints, and shades have to be considered with a view to happy arrangement. The rule given in p. 21 is not to be controverted, that not more than two primary colours should be resorted to for the decoration of beds, and of these colours scarlet and yellow are better for boundaries to a centre than for the centre itself. Blue is perhaps the best master colour for every scene, and experience justifies Mr. Johnson's caution against the abuse and profusion of yellow. A little goes a long way in golden foliage, as may be seen by any one who, after a surfeit of yellow calceolarias in a bed-centre, falls back upon "gold-chain geraniums" in their place, and finds the change an excellent one. In reds and yellows nature furnishes a rich choice of flower, fruit, and foliage. Both deciduous trees and many of the conifers and other evergreens supply rich golden effects in the aspect of their foliage; and as to reds, the Red Dogwood and suchlike trees in their bark, the scarlet thorns and chestnuts in their flower, the American oak, English elm, and common beech in their leaves, and a host of evergreen and deciduous shrubs in their berries, furnish a succession and variety of these all the year through. Mr. Johnson endeavours to teach us how to blend, compare, and contrast these, and in so doing he maintains that "yellow seems to approach the eye, red to retain its position, blue to retire; dark shades to give depth, and light ones elevation." Perhaps we may judge of his other postulates by the last, and no one will dispute the importance of light shades to impart height, and to contribute to distant effects.

Carrying these principles into the second book, the author applies them with effect in his chapters on Lines of Sight, Lines of Distance, and so forth, as well as to the decoration of given spaces with the three grades of vegetable growth—carpet-plants, shrubs, and trees. His problem is so to occupy a given site that its charm shall not be fitful, its outlooks not fewer than nature gave or art can contrive, its facilities of enjoyment not curtailed either by blundering obstructions or by indifference to palpable rules and laws of beauty. Thus, in the first place, he would plant for future as well as for present effect, and to this end would blend the bedding-out system with an arrangement of herbaceous subjects and evergreen shrubs with an eye to permanence. The space between the back outlines and the foreground of a landscape he would allot to growths of summer display, the outlines themselves to plants that may charm even in the winter. It is obvious that among the latter the Rhododendron, Ilex, Arbutus, Berberis, with other and smaller growths, will be prominent by way of basis to their attractions, but the tables of special effects of trees and shrubs given at pp. 94-5 will perhaps be more suggestive of hints to the reader than the somewhat more technical plans with which the work is illustrated. We sympathize with Mr. Johnson in his crusade against the mixed dotting system, and in his plea for harmony of arrangement. Though we hardly think he need have cautioned readers of sufficient cultivation to open a book on landscape gardening against putting scarlet geraniums in a "rosetum," we commend him for the hint that such vegetable forms as ivies, hollies, and rhododendrons are best grouped with their own varieties, for purposes of comparison rather than of contrast. So with carpeting plants, woolly plants, minute-leaved, succulent, and trailing plants; though it is not objectionable to mass with each other subjects of similar habit—e.g. *Pentstemon* with *Antirrhinum*, or *Primulas*, *Alyssum*, *Gentiana acutis*, *Campanula*, and *Lobelia fulgens*. To revert for a moment to the rose-bed, it is a good hint of Mr. Johnson's, towards the end of his volume, that it may be advantageously interspersed with plants of the Acer negundo or the Spirea Lindleyana, which will both enhance the beauty of the roses when in bloom, and furnish a pleasing object to fall back upon at other times—to say nothing of the value of the Acer negundo as a foliage plant, and of the Spirea for bouquets.

In considering his materials for covering the lawn or garden space effectively, our author lays down the law that shrubs should be arranged, "firstly, according to their masses, and, secondly, in accordance with their outlines," whilst with trees, on the other hand, it is just *vice versa*. In illustration of the former position he cites the rich character of grounds planted with rhododendrons:—

The effect of their undulations and foliage-massing and outlines, loaded with brilliant flowers, may be much enhanced by borrowing hues of silver and gold from other plants, more especially at the season when rhododendron flowers are scarce. Their masses of rounded foliage gain much by being contrasted with growths of columnar and horizontal form.

We may here observe that there is no real discrepancy between this remark and one to which we have already referred about massing rhododendrons, ivies, &c., with their own varieties, because in the latter case it would seem to be the effects of outline in particular trees and larger shrubs that are contemplated by the author. In the same sense he dilates, further on, upon the fitness of rhododendrons as supplying a basis for effects of larger growths of vegetation, and a point of union between these and plants in the middle line of sight. "The Rhododendron," he adds, "is beautiful when employed to realize a leading effect in scenery, particularly when surrounded by vegetation of a darker shade than its own, such for instance as is witnessed in many species of the fir tribe." How sound his views are on the matter of allowing room and space for shrubs and trees may be seen in the rare beauty of even so everyday a tree as the larch, when it

has been thus liberally treated. Instead of displaying a bare trunk and limbless sides, its draped and pendulous lateral branches kiss the very ground with their fringes. In his interesting pages on the different characters of trees our author pleads for full room for the grand tribe of Piceas to develop in; and he maintains that, when so treated, either singly or in a judicious group, upon a suitable site, they are as worthy of admiration as even the chestnut avenue in Bushy Park. Among evergreens he has a great leaning to the Cedar of Lebanon, for which he rightly deems the Cedrus Atlantica, in its light, bright hues, a poor exchange. It certainly has not the same grand and sombre effect in giving unity to scenery, or enhancing the façade of buildings. The Picea he would rightly relegate to a greater distance, and then he would not suffer them to be arranged in avenues, for which deciduous trees suit better. Certainly modern experiments in this direction incline us to agree with him, though we cannot shut our eyes to existing fine effects in avenues of Scotch firs, planted, according to tradition, in tacit proof of the attachment of the planters to the cause of the exiled Stuarts. As if to meet the landscape-gardener's demand for permanency of agreeable form and foliage, the conifers, as is shown in Mr. Johnson's second book, may be used with good effect in cases where spiral, pyramidal, columnar, tabular, or pendulous habit, as well as hues and shades of green and gold, semi-green, grass-green, and silver, are required for the necessities of landscape beauty. It is impossible to glance at the descriptions here given of the various deciduous trees, their qualifications, and their fitting localizations. We must, however, heartily endorse Mr. Johnson's wish "that a name should impart something of the character of species, as with the *Populus fastigiata*, or columnar poplar, reminding us of their beauty and, if it might be, economic uses." Something, he thinks, might be done by the Royal Horticultural Society to promote the correct terminology of plants, both in books and in public parks and gardens. We may remind him that a meritorious step in this direction has been taken, some years ago, in the Victoria Park at Bath, where every tree and shrub is carefully labelled, and the same practice prevails more or less in the London Parks. We should like to see it extended to our provincial arboreta. It takes some little education in arboriculture to appreciate such abnormal facts in tree-life as the instance which Mr. Johnson quotes of the *Quercus ilex* becoming deciduous in the winter of 1870-1; of a distinctly pendulous *Thujaopsis borealis* at Castle Leslie, and a perfectly pyramidal *Taxus baccata* at Highborough, which last had not been so shaped by the knife. Nor is it, we suspect, generally known that the common yew will grow and flourish on the roots of other trees, even of the elm and the beech, and instead of striking out aloft, will carpet the ground for many years.

We have as yet said nothing of the author's views as to laying out the ground which he purposes to cover with shrubs and trees. It is in truth here that we can only partially follow him. Though he honestly discourages such *tours de force* as removing mountains and introducing lakes without consideration of the natural features of the situation, we think he unnecessarily multiplies his heads of arrangement when he discusses "General Effects, Recesses, Grouping, Promontories, Avenues, *Extents*, *Expands*, Intermediate Scenes, Leading Objects, Artificial Work, Bowers, *Rests*," &c. Some of these heads are far too technical for general application, and we should tremble for the result of a development of ground *secundum artem* to this extent. Undoubtedly in undulating ground, or ground which can easily be rendered undulating, sites of depression will admit of their own special effects, and sites of elevation of theirs likewise. Mr. Johnson calls the former *Recesses*, dividing them into the Flower-garden, the Rockery, the Rosery, and the Wilderness; and the latter he calls *Promontories*, which aid in harmonizing scenery, and furnish centres and outlooks surmounted and diversified by striking tree-forms. It does not appear with which of these divisions the bowers are to be associated. The flowering ash, Robinia, and weeping birch might point to a promontory, but the Clematis, of which, along with a variety of more delicate and fragile climbers, we should prefer to weave our bower, would seem better adapted for the shelter of a recess. A good list of such climbers is given in p. 136, with honourable mention of Mr. Jackman's success in the development of the Clematis. To the arrangement designated *Rest*, p. 103, we looked in the vain hope of discovering something new in garden seats—at the very least a new edition of the "*vivo sedilia saxo*" of Virgil and Ovid; but a glance showed us that "ivies, vincas, and evergreen shrubs" were accessories which did not promise "repose" in the sense we had fondly imagined, at all events not repose undisturbed by insects and slugs. Mr. Johnson makes much, but not too much, of water-effects, where they can be had, and he ventures on a mild joke when he remarks that "rooteries are sometimes substituted for rockeries."

When we arrive at the third part of the author's subject—our remarks on which must be crowded into two or three sentences—we seem to tread familiar ground. Scenery, we are taught, has two divisions—natural and artificial effects, the latter being associated with buildings, the former with land. It is here that the relation of park and garden to a mansion becomes alike interesting and instructive. We are taught how to lay out the interval between art and nature, between the house and the ha-ha; and between the precincts within the range of a sunk fence and the natural undulations beyond it. The Irish juniper, for instance, in its columnar growth harmonizes best with the former, the *Pinus excelsa* with the more far-away slopes. "Wild scenery ought not to come too close to our doors, nor the waving and sometimes rugged outlines

of the forest prove the limitaries of great mansions. It is well to have some intermediate character of lines to give union, e.g. the Oedrus Libani in all its natural majesty will not, when in contiguity, prove incongruous." Hints such as these show a practical grasp of the subject to which Mr. Johnson's literary power scarcely does justice; and the same remark applies to his ideas about roads, public and private, avenues, walks, and the like. Still, whatever may be the defects of literary style, his work is quite worth a careful perusal, and we have only to wish that its bulk were reduced by two-thirds, which it easily might be if the author would confine himself to practical matter.

FREEMAN'S COMPARATIVE POLITICS.*

THE difficulty of finding a name seems likely to press with increasing weight on the discoverers or propounders of new sciences. The science which concerns itself with the growth or structure of any given language received without much hesitation the title of philology; when the field of research was extended to all the languages with which it might have any affinity, comparative philology was readily suggested as a fitting name for the science in this its wider application. In the same fashion, mythology, which brings together and scrutinizes the epical or popular stories of a single people became comparative when these stories were examined side by side with the traditions of tribes which might or might not be of kin to that people. It is not less obvious that, if any two or more tribes have a common language and common epical traditions, and if these traditions betray an indefinite agreement in thought, manners, and habits, they may have like correspondences in their political growth, and thus in their modes of making and administering law. It is even more likely that they will resemble each other in matters which seem in priority of order to have preceded the formation of any definite political ideas—in other words, that they will exhibit points of likeness in religious thought. The method which seeks to determine and arrange the points of likeness and difference under these two heads deserves the name of a science not less than that which concerns itself with the speech or the myths of any given tribe or people. But at present no better name has been hit upon for the one than the Science of Religion, while for the other Mr. Freeman contents himself with the title of Comparative Politics, and would prefer to retain his science without a name rather than that it should be labelled "Sociology."

"If any persons choose to lay stress on this lack of a satisfactory name, we have no intention of following in their steps. Still less do we care to determine whether, in upholding the claims of a new science, or of a science supposed to be new, Mr. Freeman has said things which he or others have said already. We do not even care to treat the existence of the science of comparative politics as a subject for discussion. We will assume it to be fully proved; and at this time of day we may surely do so without fearing to be accused of going too far or of unlawful exaggeration. For those who know what is meant by the term race, and who therefore know what is meant by the distinction which separates Aryan from Semitic or Turanian tribes, there can be no need to say that if Aryan tribes resemble each other, to whatever degree, in their speech and in their forms of religious and philosophical thought, they will resemble each other also in their popular usages and in their methods of making and administering law. The three things will hang together, and the real question will be to ascertain the circumstances which have determined not so much the points of likeness as the points of difference, and to measure the degrees of evidence which may in each case justify a positive or a negative conclusion. That Mr. Freeman's position, so far as he states it, is fully borne out by fact, we have no thought of disputing; but this may be said of many, perhaps most, of the conclusions of Niebuhr, Arnold, Thirlwall, and Grote; and it seems clear that we cannot expect to get rid of difficulties until we have fairly sought to ascertain whether any given matters assigned as causes for a particular state of things are not rather to be regarded as effects of a previous cause, the knowledge of which is really needed to explain the seeming mystery.

It becomes, therefore, a matter of the first importance to determine the measure of confidence which we may place respectively in the three sciences of comparative philology, mythology, and politics, even if we say nothing of the comparative science of religion. We have heard much of the wonders achieved by the first of these sciences, which in Mr. Freeman's eyes seems invested with more of the attribute of infallibility than we should choose to assign to it. Exceptions to Grimm's Law are by no means altogether lacking; nor is it as yet conclusively proved that, even if the radically distinct origin of the great branches of human speech be granted, the analogy of sound which suggested a root for the one might not suggest the same root for the other. Mr. Freeman thinks that there is at least room for the belief that the simple stories and easily imagined situations "which form the staple of the legendary lore of most nations, may have been invented over and over again in distant times and places"; but he seems to regard it as inconceivable

that, although the grinding of corn may have been frequently hit upon, those who discovered it "should all have called the instrument of grinding a mill." If the word *all* be struck out, we see no insurmountable difficulty in believing that the sound made by the rubbing of stones together may have suggested to many tribes the root *MR* or *ML*, and that a certain likeness should be traced even among the derivatives from these roots in their several dialects. His own position is probably weakened by the jealousy with which he reserves to the science of philology the final verdict in deciding the identity or diversity of popular myths. If the names in two or more given stories of which the incidents are alike be philologically the same, they come from a common source; and so there can be no doubt about tales in which Helios, Selene, Asterodia, and Hersé are the actors. But the same confidence cannot be felt where this clue of language is lacking; it cannot even be felt in all cases where it is found. The etymological connexion between the Charis of the *Iliad*, the Charites of the *Odyssey*, and the Vedic Harita cannot, Mr. Freeman holds, be disputed; but he also regards the opinion "that they took their name from the noun *χάρις*, in the later and ordinary sense of the word, after that later and ordinary sense had parted off from the original root," as not untenable. It is, we think, to say the least, to the last degree unlikely. That *Atē* and the *Latai* are direct impersonations from the later sense of the words is extremely doubtful; and although there seem to be some manifest impersonations in the Hesiodic theogony, as of the Long Hills, these impersonations have no office. The Charites wrap Phoebos in the pure white robe at his birth, and anoint Aphrodite with the glistening oil. It is almost impossible to believe that beings invented from a word after it had lost its original meaning should fervor in their work to that earliest sense which is preserved in our word "grease."

But although Mr. Freeman maintains that a comparison is not unassailable until it has been approved by the strictest philological tribunal as coming within the sphere of its jurisdiction, he seems to be somewhat impatient of these trammels, and to plead for the acceptance of inferences which flow or seem to flow from such comparisons. The positive argument in the science of comparative politics he regards as conclusive; but the negative argument, he thinks, is by no means so strong:—

The caprice of language is so great, words drop out of use in one tongue and are kept in use in another in such a singular way, that the mere fact that cognate institutions are not called by cognate names is not, of itself, proof that they are not part of a common heritage. We must weigh all the circumstances and all the different forms of evidence. Of all the forms of corroborative evidence, the philological form is doubtless the highest, but it is not the only one. If two nations are shown by other evidence, especially by philological evidence applied to other subjects, to be kindred nations, holding in common a large share of the primitive common stock—if the nature of their political institutions, no less than of their language, their mythology, their customs of other kinds, naturally suggests the thought of a common derivation—the mere fact that their institutions do not bear cognate names is not enough to disprove, or even to throw doubt upon, the common derivation of those institutions.

This position is, we believe, thoroughly sound; but it is certainly not strengthened by placing narrower bounds on inference in the kindred science of comparative mythology. It may be convenient for Professor Max Müller to confine himself to an examination of those myths in which, although they belong to different languages and tribes, the names are philologically identical. He has nowhere, so far as we are aware, put the fact of his thus limiting himself on any other ground than that of convenience; but no reason is thus furnished why another should not extend his view to myths in which, while they unquestionably resemble each other in substance, the names translate each other, or in which identical incidents occur in a complex sequence which makes the notion of independent origination impossible. There is no etymological connexion between the Teutonic story of the Spirit in the Bottle, and the *Arabian Nights* tale of the Fisherman and the Jin; nor between the Greek *Oidipous*, who knows nothing, and the Boots or the Great Fool of Teutonic and Celtic tradition; but their connexion is as manifest as that between the Senate of the Romans and the Gerousia of Sparta.

The philological argument will probably be found to go further both in politics and mythology than is commonly supposed. The English *cyning* and the Gothic *thiudans* translate each other, as being each called after the *kin* or people, and they both denote the same office. The Greek *Basileus* and the Latin *rex* translate each other, but the names have not the same origin; yet the *regnum* of the Latin King is the *rice* of the English; if of the one we say *rex*, of the other we say that he *riceth*, as the Greek *Basileus* was said *ἀρχαυ*—all these words being referred by Dopp to the root *braj*, to *shine*, which gives us the Eastern *raja* on the one side, and the Teutonic *Hrugi* or Light God on the other.

With the rest of this volume we have only to express our hearty agreement; nor do we quarrel with anything in it because we are familiar with it already in Mr. Freeman's pages elsewhere. The facts stated seldom come in the same connexion, and, whatever may be said to the contrary, it is absolutely necessary to state many facts or discoveries again and again, until they work their way down into the minds of all alike. The connexion between the languages of Greeks, Latins, and Germans is still hidden from vast numbers of people, and the putting forth of comparisons between their habits, laws, and their political institutions is like the uttering of dark sentences. But probably some of the points on which Mr. Freeman insists might have been made plainer if he had carried his examination somewhat further back. Thus we are told that the gathering of *curia* or *phratry* forms the tribe, the gathering of tribes

* *Comparative Politics*. Six Lectures read before the Royal Institution in January and February, 1873. With the Unity of History, the Rede Lecture read before the University of Cambridge, May 29, 1872. By Edward A. Freeman, M.A., Hon. D.C.L., late Fellow of Trinity College, Oxford. London: Macmillan & Co.

forms the State. But alike at Rome and at Athens tribes formed of *curie* and *gentes* lost their political significance, and gave way as political institutions to tribes of later origin founded on another principle. In the later stages of both Commonwealths, the elements of which the Commonwealth was made up were no longer the primitive genealogical tribes, but tribes which were essentially local.

This is, of course, perfectly true, but there is a distinct effort of mind in retaining our knowledge of the change until we know why the change was rendered necessary; because, namely, the genealogical tribes represented ultimately an aggregation of families, each of which at starting had formed the beginning and end of society, founded on the worship of the dead lord or lords, keeping up a ritual in which it was a profanation for any one not of kin to share, regarding all without its own circle as dogs or snakes, bitterly intolerant and intensely cruel in its exclusiveness; because, further, this root of all bitterness was carried on into those unions of such isolated families which made up the clan before the union of clans formed the tribe—the clans and tribes acquiring of course a fellow-feeling and a certain spirit of forbearance towards each other, but retaining for all who lay beyond a hatred not less fierce and bloodthirsty as being a hatred of those who were enemies of their gods; because, further, the chiefs of these families had set up their landmarks and shut out the common herd from all hope of becoming themselves owners of the soil, and because the remedies applied by such legislators as Solon, although for the time they did much, failed to touch the root of the disease. Hence the substitution of local for genealogical tribes was really a deathblow dealt to Eupatrid ascendancy; it ensured first the growth and then the supremacy of the people; it asserted that religion—the old religion, to which alone the Eupatrid would allow the name—was not to crush mankind for ever beneath a rod of iron. But although it did all this, the genealogical tribes were not extinguished. At Athens, as elsewhere, they continued to exist, as bodies whose interests were by no means always the interests of the State, of justice, or of humanity; and their malignant influence showed itself in the frightful iniquities to which the Athenian rabble suffered itself to be bounded on after the victory of Arginæusai.

In short, everywhere we find this spirit of isolation—the primitive separation of the brute in his den, strengthened by the religion which had its root in the worship of ancestors—cropping up in greater or less strength. We find it at Athens, checking and hampering the action of statesmen as far-seeing as any of what we are wont to speak of as our own enlightened times, and almost everywhere else in Hellas, well nigh preventing all political growth, and rendering utterly impossible the formation of a Greek nation.

We touch a point here in which difference of terms implies a difference of things. Mr. Freeman admits that we “expect, as a rule, the nation to form a single government,” and that “political unity enters into our general idea of a nation”; but this fact, he holds, “merely shows how greatly we have changed in this matter from the political ideas of earlier times.” In the Greek mind, for example, he urges, “there was a distinct idea of a Greek nation, united by a common origin, speech, religion, and civilization.” Surely so wide a difference in reality involves a substantial difference in the notion of which that reality is an expression. Whatever else a nation may be, it is surely a body the members of which are under certain duties to one another. Of these obligations the Greek knew nothing. The war of Boiotians against Phokians was not civil war; it was not a thing to which they felt the least repugnance; it was the most natural thing in the world. When Achilles said that he had no liking for a man who loved war, he added that by war he meant a contest between members of a *phratría*, i.e. between those who professed to trace their origin and to pay their worship to a common ancestor. The Amphiktyoniai, great or small, were in no sense nations national; at best they were mere religious fraternities which bound their members to no special courses of action if they chose to regard one another as enemies. In other words, they did little or nothing to weaken and root out the spirit of isolation which for all Greeks, except the Athenians, may be said to have remained the very breath of life. During three, or perhaps four, generations Athens did what she could to counteract this fatal tendency, but she was attempting a task beyond the time, and she failed. Mr. Freeman might perhaps have brought out more clearly the nature and ends of the work which some Athenian statesmen at least had set before themselves; but the contrasts drawn between Athens and Sparta, and again between these and Macedonia and Rome, are among the most instructive portions of this volume.

SOME TIME IN IRELAND.*

IRELAND was long celebrated for its blunders and bulls, but of late years it has proved prolific in bores. It is to be hoped that, in accordance with the old saying about the happiness of a country which has no history, the prosiness of modern books about Ireland denotes the calm of increasing prosperity. Why the book which we have now before us was written can be known only to its author. This venerable lady, who lived in the county Waterford a long time ago, and who now publishes the chronicle of her frocks, her flirtations, and her fine acquaintances, has no perceptible aim of any kind. There are faint indications of a wish to instruct

the “legislators who assemble in St. Stephen’s, Westminster,” and perhaps the author expected to rouse the attention of gossips by her free mention of persons and places, as for instance, of a well-known proselytizing Bishop, and of an excitable lady of the Bonaparte family. But few things are more dreary than sketches of character by a writer who neither appreciates character nor knows how to draw.

Although there is little worth reading in the book, it is racy of the author’s native soil. It is pervaded with the volatile essence of Irish gentility, and, though the analysis may not be agreeable, this extraordinary phase of human nature is singular enough to be worth examining. “We never affected to be considered native Irish,” she says, and she is careful to explain that her ancestors “came over with other Cromwell settlers.” And then we have a fairly true, if trivial, sketch of servility and arrogance, of bigotry and religious indifference, of rackrenting and ostentation, and of shift instead of thrift in the annals of this “leading family.” The writer appears even to have lost the last inheritance of such parentage as she describes, for she misses the grotesque humour, the incongruity yet the pathos, of the situation. The race of orators and wits who buzzed and stung in the Irish Parliament was not extinct at the period when these chronicles begin, but there is no trace of them here; the author is chiefly concerned with the misdeeds of her governors, the tricks to catch the major or the captain on the Mall at Waterford, or the millinery of her sisters. Many pages are devoted to the unutterable glory of a ball at Curraghmore, and to the galaxy of young noblemen who were there. Now, in a novel certain details of the dietary and pinaflores of childhood may be useful in evolving character, but we get no clearer notion of Irish society by records of Miss Kathleen’s porridge and Miss Eveleen’s “hat of white chip with detached bouquets of forget-me-nots.” Probably there were elements of fun in the Dunmore *collegiatura*, where the nobility and gentry of the county packed themselves into a row of cottages by the sea and chaffered for the shilling chicken of tradition and enjoyed a primitive community of crockery and saucepans. But if there were humorous passages in this kind of life, the spirit of the fun has evaporated, leaving but a residuum of vulgarity.

The author turns from domestic life every now and then and tries her hand on historical and political subjects with indifferent success. O’Connell crosses the stage at a contested election, “his right hand waving his cap, his left placed on his breast, across which was a broad green sash”; and of course he appeals to the “hereditary bondsmen.” There are “priestly denunciations,” evictions, and the machinery familiar to us in Irish affairs, not omitting the showy, dishonest, tyrannical land agent who has for nearly two hundred years played so large a part in them. This ancient lady shows questionable taste in gossiping as freely as she does about families and persons who, whatever their sine, hardly deserved the cruel fate of being thus commemorated. Yet after all, her visit to Curraghmore has a moral worth noting. Her Cromwellian father represents a class. He was a large landed proprietor and an important personage in the county, but he had none of the dignity of an English squire of the same rank. By tradition and practice he and his forefathers were mere dealers in land. The rights and privileges of their position were greedily maintained, but only as so much stock-in-trade, while political and religious ascendancy was deemed precious because it enhanced the value of the bargain with the English Government. It is perhaps natural that this species of gentry should be depressed and servile in presence of the English party in the great house of the neighbourhood. They cringe to the “Marquis, his amiable lady, and the sweet Lady Constance.” London clothes, London airs and gossip are the paradise of the children of the Cromwellian settlement. There is a special roll in the phrases that treat of the English magnates, and in the reflections on their morality at the end of those chapters that introduce us to the festive scenes in which Lord Jocelyn dances “superbly,” and in which “an intimacy is established” with the transcendent Lady Constance. “Alas,” mourns the author, “in the language of the patriarch,” even these “have said to Corruption, thou art my father!”—language which in another sense the politician might well apply to the Irish gentry, whose characteristics the book is intended to set forth. Coming down from the mount of aristocratic glory with its effulgence full upon them, the family remain in a rapture during some days. Only a contested election, in which the “Romish” priests of course play an evil part, brings them back to the joys and excitements of “the Mall,” the Cathedral gallery, and the fashionable milliner’s shop of Waterford.

The political battle between clergy and landlords for the votes of the people is far from being so amusing and instructive in these pages as in some recent reports from the West of Ireland. As usual, no one appears to be the least in earnest. There is no principle to control the conduct of rich or poor, though principles are trailed in every direction for aggressive purposes. The author, while ignoring the faith and hopes about which the Irish are really in earnest, unconsciously expresses the national superficiality. Of her reminiscences, now of a bonnet, now of a brutal murder, of her reflections, whether on the massacre of police at Carrickabock during the tithe war, or on the best way to catch a husband, it is impossible to know which are meant in jest and which are serious. If she ridicules the priests, she is not less satirical at the expense of the “Evangelical wave.” She shows the usual Hibernian disrespect for everything Irish, including her uncle, a dignitary of the Protestant Church; and even when she utters the stock remarks

* *Some Time in Ireland: a Recollection.* London: Henry S. King & Co. 1874.

about the late Establishment, or the famine, or about the social sores with which we are too familiar, it is difficult to resist the suspicion that when she is most solemn and bombastic she least expects to be taken in earnest. The glimpse she gives of her class and its ideas, however slight, reveals at least some of the weaknesses which have made it contemptible and injurious to the people it was supposed to lead. We see something of the disreputable struggle by these land traders to be great men on swamped estates, of their incapacity for co-operation because of mutual distrust, and of their consequent loss of caste and power. Their clamour rends the air when truth is spoken of them, yet their indifference to truth is extraordinary, except when for some jobbing purpose it suits them to be sensitive.

This book, except in so far as it unconsciously betrays certain flaws in Irish character, has hardly the merit even to provoke a smile. The author, venerable matron as she announces herself, betrays her natural frivolity in every page. She buttonholes us to tell of her delightful acquaintance with the "tall and slim Lord P.," with Lord J., a "man of fashion, with a decidedly military carriage," and with "the Marquis." We have specimens of aristocratic chit-chat concerning "the Earl's Mother, who prays, preaches, and expounds in public," and we are bound to confess that our author shows a very pretty familiarity with exalted personages when she adds, "Every one knows what Lord Jocelyn's Father's views are about worldly amusements," capital letters being indispensable in expressing these august relationships. With the same gush she makes obeisance to "the last of the Prince Bishops of the Irish Church," and to the "brick-coloured satin Toques" of his sisters, who did the honours of that hall at Curraghmore which was the culminating point of our heroine's career. Her question to her uncle the canon, while driving thither in his carriage—doomed subsequently by the "trudging policy of the English Government" to be "laid down"—will serve as an example of the author's opinions. *Apres* of a shabby equipage which follows, she asks:—

"Uncle, is there any connexion between politics and post-chaises?"

"Very good, Kathleen; your father will not have to be ashamed of his pupil. There is a connexion. If England had not absorbed the Irish upper classes, we should have had a resident aristocracy, with their becoming equipages, and a body of wealthy gentry taking a proper pride in keeping up carriages adapted to their position—very different to that which is hanging on us."

Satire could scarcely go further than this ingenuous exposition of the grievances and duties of "carriage people" in Ireland.

It is evident that when the author of these reminiscences leaves her native land her prejudice abates. Cheltenham and Leamington soothe the distempered spirit, and after a time she is ready to converse with Cardinal Wiseman and even to look on at Romish ceremonies. It is unfortunate that she should have resorted to exciting topics. She ought to have avoided the old stimulants of appropriation clauses, Catholic claims, and Lord Waterford. As it is, they seem to have quite upset the balance of her mind, or surely she would not in her preface have suggested Home Rule as a step towards bringing about that happy state when the Protestant canons of Ireland shall maintain their carriages in due splendour, when domesticated marquises shall give perennial balls to a numerous "army," and admiring Saxons crowd to do homage before Erin's daughters.

THE COINS OF ANCIENT SYRACUSE.*

ABOUT a year ago, in noticing Mr. Poole's Catalogue of the Greek Coins in the British Museum, we expressed the hope that the science of Greek numismatics might be developed not merely by general catalogues, but by critical essays and monographs on the coins of particular Greek cities. The memoir before us, in which Mr. Head gives in a very clear form the numismatic history of Syracuse during a period of more than three hundred years, is a welcome instalment as far as it goes. Numismatists and students of art need hardly be reminded that the coinage of Syracuse is more continuous and complete than that of any other Greek city. Those celebrated silver pieces known to the collector as Syracusan medallions, but which it would be more correct to describe as decadrachms struck by the two Dionysii, are among the finest efforts of ancient numismatic art, and are the more interesting to us because through a series of earlier coins we can trace the successive steps by which this marvellous perfection was attained. The method of Mr. Head's memoir is to show how by numismatic evidence the entire series of Syracusan coins can be classed in periods from the latter part of the fifth century to the capture of the city by Marcellus B.C. 212. In its main outlines this classification corresponds very nearly with that proposed by the late Duke of Luynes in the *Revue Numismatique* (1843). It was that distinguished archaeologist who first identified the archaic silver decadrachm of Syracuse with the Demareteion struck by Gelon I. in honour of his wife Demarete about B.C. 479, the year after his great victory over the Carthaginians at Himera. On comparing the legend of this coin with the dedicatory inscription on the helmet dedicated by Hiero I. at Olympia about B.C. 475, we find such a marked resemblance in the forms of the letters as fully to justify the identification proposed by the Duke

of Luynes. The date of this archaic decadrachm being thus found, there is little difficulty in determining the chronological succession of the silver coinage of Syracuse generally. Certain coins more archaic than the Demareteion in style, and differing from it in type, are on good grounds assigned by Mr. Head to the period of the Geomori, whose oligarchy preceded the rule of Gelon. Another cardinal point in the chronology is the coinage of the two Dionysii, B.C. 406–345. If we assume, as numismatists now generally assume, that those splendid medallions to which we have already referred are decadrachms struck by the Dionysii in imitation of the earlier Demareteion, we can range round these cardinal specimens of the Syracusan mint a number of smaller contemporary pieces; and, having thus demonstrated by emphatic examples the general characteristics of the Archaic and of the Finest Periods of Syracusan art, we have no difficulty in discriminating the coinage of the Intermediate or Transitional Period, which ranges from B.C. 406 to B.C. 406. From the time of the Dionysii the work of classification is much easier. The mintage of the democracy restored by Timoleon, B.C. 345–17, is recognized by the Corinthian types then introduced; the coins of Agathokles, B.C. 317–289, of Hiero II., his queen Philistis, and his grandson Hieronymos, B.C. 216–5, all known to us by their legends, enable us to class a number of pieces struck during these reigns, but not inscribed with the name of the ruling prince.

The admirable photographic plates executed by the autotype process, which illustrate Mr. Head's memoir, exhibit most clearly and emphatically the development of Syracusan art through these successive periods; and when we compare this long series of coins with the contemporary works of Greek sculptors, we see how the broad characteristics of style which distinguish the monumental works of successive centuries repeat themselves with a regularity to which there are few exceptions on the coins of the same periods throughout the Hellenic world. If we possessed the coinages of the principal Greek cities in a series as perfect as Syracuse exhibits, we should have, as it were, so many biographies in illustration of the general scheme of ancient art; but when we examine the extant specimens of other Hellenic mints, we find no such complete chain of numismatic evidence as at Syracuse, but rather a few disconnected links, the original sequence of which cannot be determined, because we do not know how much is wanting to complete the series. The coinage of Syracuse is a fair volume with hardly a page wanting; the coinages of other Greek cities are for the most part but stray and tattered leaves torn from such a volume. After perusing the numismatic history of Syracuse from beginning to end as it is recorded in Mr. Head's plates, the following points strike us as specially noteworthy.

We have, first, to note the marked preference for certain types which prevails in the silver coinage from the time of the Geomori till that of Timoleon. During this entire period the dominant type on the reverse of the coins is either a four-horse chariot or a horseman. Both these types from the time of Gelon I. onwards, if not from an earlier date, commemorate Agonistic Victories, and that these victories were gained at Olympia seems on the whole the most probable supposition. In a valuable memoir in the tenth volume of the *Transactions of the Royal Society of Literature*, Mr. Poole notes how this chariot type prevails in other cities of Sicily, such as Agrigentum, Kamarina, Katana, and shows how in the several instances its adoption may be connected with Agonistic Victories recorded in Pindar and elsewhere. Chariot-races and horse-races were then, as now, contests in which the rich only could win the prizes; and thus these Agonistic types on coins seem always associated with aristocratic or monarchical rule, and it may be doubted whether they were ever introduced under other political conditions. It was but natural that the rich and the ambitious should prefer these Agonistic types, for the coinage was thus made to publish the honour gained by the city, while it commemorated the wealthy aristocrat or political adventurer at whose cost this honour had been won; and doubtless this compendious publication, through a currency which passed in daily traffic from hand to hand, contributed not a little to that celebrity of the victor of which the "breathing Bronzes" dedicated at Olympia and the fervid Odes of Pindar were the nobler and more abiding record. On those earliest silver tetradrachms of Syracuse which are attributed to the Geomori, the quadriga is driven by a male charioteer, the horses move with hearse-like monotony; there is as yet no symbol of Agonistic Victory. On the coins of Gelon I. the winged personification of Victory, whom the Greeks called Nike, makes her first appearance, lying rather than flying above the chariot. From the reign of Hiero I. to that of Dionysius I. this type continues with little change; in the later specimens better modelling gives more life to the horses, and the Nike becomes more volatile; but the old slow movement is retained, as if the incident represented were not the chariot race, but the triumphal procession after the race.

With the accession of Dionysius there is a marked change in the design of the coin. It is no longer the triumphal procession, but the contest itself in all its intensity, which is represented. The horses dash forward eagerly, their tendency to loose and dissipated action is by the skill of the charioteer so modulated as to blend into one common movement, which may be described as a harmony made up of discords; and this marvellous result is accounted for when we look at the charioteer. No mortal hand guides these fiery steeds; it is a goddess—perhaps Persephone—who has taken the place of the bearded charioteer whom we find on the earlier coins. We would here draw attention to the execution of these coins. The skill with which the forms of the four

* On the Chronological Sequence of the Coins of Syracuse. By Barclay V. Head, Assistant-Keeper of Coins and Medals in the British Museum, Hon. Sec. of the Numismatic Society of London. London: John Russell Smith. 1874.

horses, so intricately combined in their united action, are yet so clearly detached and relieved against the field and against each other, is a *tour de force* hardly to be surpassed in numismatic art.

While in the chariot groups of the earlier Syracusan coins the severe and chaste simplicity of the design seems the fit emblem of an earnest and high-minded democracy, there is on the other hand in these later compositions a felicitous audacity of invention, a consummate mastery of execution, which reminds us of some of the groups in the contemporary frieze of the Mausoleum, and seems altogether in keeping with the splendid pomp with which the Dionysii masked the terrors of their iron rule. The jealous misgiving with which these tyrants regarded distinguished citizens did not apply to the artists whom they patronized, and thus we find on the Syracusan medallions, what was hardly ever permitted on the coins of Greek autonomous cities, the names of the die-engravers, Kimon, Eukleides, Eaninetos, and others, whose respective styles may to a certain extent be distinguished in extant specimens. On the coins struck by the Dionysii there is a change in the action of the Victory, who no longer crowns the horses as in the earlier type, but lies to meet the charioteer holding out the wreath; her movement, being thus counter to that of the horses, seems to enhance the speed and momentum of the bounding group.

We have as yet only dealt with the reverse of these coins. On the obverse the prevailing type is a female head, round which are set sometimes three, sometimes four, dolphins. Occasionally the head, encircled by dolphins, is that of the goddess Athene. Dolphins are the well-known symbol of salt water in ancient art, and therefore it seems probable that the heads so encircled represent goddesses whose temples stood in the island of Ortygia, the most ancient quarter in Syracuse, and its original citadel. This position, naturally strong, was specially fortified by the elder Dionysius, who established in Ortygia his seat of government and his palace. He would probably keep his treasure and his mint in one of the temples on the island, of which the two most celebrated, according to Cicero, were that of Artemis and that of Athene. Now if the coins of the Dionysii were struck in Ortygia, the head of Athene, encircled by dolphins, probably represents in the compendious symbolism of ancient art the temple of Athene on the sea-girt island; and by parity of reasoning the other female head surrounded by dolphins ought to be that of Artemis, as K. O. Muller supposed it to be. There is, however, no certain evidence in support of this conjecture, and the head in question may in some cases be a personification of Ortygia itself, while other coins may represent Persephone, and others the Ortygian Artemis. Another type, which can be more positively connected with the island, represents the head of Arethusa, that nymph so celebrated in Greek legend, who, flying from the pursuit of the Arcadian river god Alpheios, escaped to Ortygia, where she was changed into a fountain, the fresh waters of which still bubble up on the shore of the island.

On looking over the plates in the work before us, it is curious to observe how, after B.C. 345, when the rule of the Dionysii was replaced by democracy, the type of the silver coinage also changes. That well-known Corinthian type, a helmeted female head, with, on the reverse, a Pegasus, occurs abundantly; the chariot type is also found, but less frequently; but of the dolphin-encircled goddess Mr. Head only admits one example. The cause of this change in the mintage was doubtless political. When Timoleon, the Garibaldi of ancient Sicily, leading an expedition from Corinth against the younger Dionysius, succeeded in his daring attempt by the special grace of Demeter and Persephone, he demolished the Ortygian stronghold of the dethroned tyrant, and erected on its site courts of justice. It was but natural that he should at the same time efface from the coinage the symbols by which the Ortygian fortress had been associated with supreme authority, and that he should substitute for these symbols the types of his native Corinth, whose aid as mother city had so largely contributed to the revolution which freed Syracuse. When compared with the splendid coinage of the Dionysii, the pieces struck by Agathokles and his successors are tame and monotonous. The names of the die-engravers no longer appear on the coins, nor does their work attempt to rival the subtleties which through all time will give celebrity to the masterpieces of Kimon, Eukleides, and their compeers. But in this later Syracusan coinage, as in many other coinages of the Macedonian period, the historical interest in some degree compensates for the artistic shortcoming. The assumption of the title of Basileus by Agathokles, his great victory over the Carthaginians, and the brief reign of the Epirote Pyrrhus in Sicily, are all commemorated on their coins; while later still on the coins of Hiero II. we recover the name of his queen Philistis, a name still to be seen on her seat in the theatre of Syracuse, but wholly unrecorded by ancient writers.

CRAMLEIGH COLLEGE.*

CRITICS who complain of the immense numbers of novels which are published every season forget how wide a field of usefulness novel-writing now occupies, and how many other resources of folly it is rapidly superseding. In ages which are called dark and barbarous, every man who was discontented resorted to caves and other fastnesses, and thence made incursions, and avenged himself on society. This is the case even now in Spain and other countries where literature is at rather a low ebb.

* *Cramleigh College*. By Henry Belcher. 3 vols. London: Tinsley Brothers. 1874.

How much more fortunate is England, where the man with a grievance merely writes a novel with a purpose, and throws this harmless pebble at the public! Novel-writing has saved many a woman from the still lower depth of minor poetry, from religious depression, and from inflicting herself spasmodically on the local poor. It is the safest safety-valve, the mental anodyne nearest to hand, the easiest occupation for indolent conceit, the best cure for the aching heart; for the treacherous lover can always be drawn from real life, and persons who shrink from breach of promise cases may put the false one into a book. Thus novel-writing affords many of the consolations which our energetic forefathers sought in war and in religion, and society becomes more peaceful, though less picturesque. In place of bandits and crusaders we have crowds of writers of fiction. Life is much less stormy than it was before reading and writing became such common accomplishments, and the efforts of silly people are only annoying, not positively pernicious. Still they are very numerous, and very wearisome to those who have to read them. Which may be the very silliest of these silly ones, we sometimes wonder, just as Mr. Carlyle once speculated as to where the greatest of living fools might be existing all unconscious of his greatness. The question admits of no answer, and the wonder will never be satisfied. The *chef d'œuvre* is equivalent to the *chef d'œuvre*, and there are sublimities of silliness among which no man may decide which is the most barren and worthless. Who shall judge between the frantic author who drags his characters through crimes that are artistically blunders and the twaddling writer who dawdles over the conscientious scruples of consumptive cousins? But if opinions differ as to which may be the most imbecile fiction of the period, no reader of *Cramleigh College* will have much hesitation in pronouncing it to be the most tedious. Victor Hugo once said of another French poet that his works caused a new kind of shudder, and the author of *Cramleigh College* has managed to cause a new sort of yawn. This is his private glory and distinction, for unluckily there is nothing singular in his bad grammar or in the jargon which he takes to be English. Novelists have long accustomed us to such sentences as "He valued people, like certain persons are said to value books, by their blinding"; "He was kept in front of the black-board until he felt somewhat like an Egyptian statue must feel, as having sat down never to get up again." Nor is Mr. Belcher original in calling soap and towels "minor accessories of aqueous hygienics." Many writers are practised in such beauties of style, and most are dull; but Mr. Belcher is wearisome of set purpose, and dull in obedience to an æsthetic theory of his own invention. He has obviously given some thought to the conditions of fiction, and favours us with his views as to what a romance should be:—

There still remains a vast amount of mere commonplace matter that the hand of a master could touch, clear of undramatic element, by rearrangement of parts, and make powerful, didactic, full of feeling, for most of us. I should like to read a novel dealing with this stage of life. . . . The adventures of a half-pay captain, married to a lady with a small fortune in the Three per Cents., might be worked up into a most interesting narrative.

Mr. Belcher acts on his own theory, but he cannot be said to have worked up his petty material and dreary characters into a most interesting narrative. There is no element in *Cramleigh College* that is not commonplace and sordid; there is no single character who, if met in real life, would not be recognized as a typical bore. The lay figures of other novelists are dreary because they have no animation, because they are mere puppets. But the characters in *Cramleigh College* are drawn rather carefully, and so to speak lovingly, from the most tiresome people that an unlucky man might meet in the course of a long and unhappy existence. And the author has been careful to provide them with what Mr. Congreve would call an appropriate *milieu*, an atmosphere of tedium.

Cramleigh College is a novel with a purpose, or rather with two or three purposes. The writer has a grudge against competitive examinations and crammers. This grievance pervades his first volume, while the third is occupied with the dangers of financial speculation. There is absolutely no plot, for the typical bores who do duty for characters have no passions which might supply the stuff for a plot. The reader is left to contemplate these persons, and to derive what pleasure he may from the comparative study of different forms of meanness and vulgarity. Perhaps in the complete absence of any other interest, it may be as well to give some account of the different bores whom the author has depicted with such tender anxiety. Bore number one, his favourite specimen, is the hero's mother, who is thus described:—

She, in her eagerness to find out all that could readily be known of a new topic, would fill her drawing-room with outlandish people twice or thrice a week. Experiments were conducted that filled the house with noises, burnings, and uncelestial smells; sometimes she fossilized, and then it was bones, sometimes she spiritized, and then it was ghosts; sometimes she parochized, and then it was soup.

Elsewhere her praises as a specimen of dreariness are stated with proper pride:—"Her mind was of the cast that bores some folks terribly. It would be hard to conceive a greater bore than Hester Chatfield might be to not a few persons to be met with in life." Her surroundings are described as being quite worthy of her. Mr. Belcher has introduced some of her insufferable connexions, confessedly because they are depressing, and he dismisses them thus:—"This couple drop away from our view. It is true they have played no particular part in this story, but what more was to be done with them?" What indeed? and what amusement can be got out of any of the other dullards who do play some part in this story, such as it is? The parochizing woman's part is to pet her son, and make

love to his schoolmaster. The son Arthur, who is the hero of the tale, is simply a Cub, who is sent to Cramleigh College—a private school kept by one Dr. Chatfield Jonah, a bore of the old school. The doctor's forte is preaching sermons—we are actually favoured with one—and making misquotations from Horace. These accomplishments endear him to the widow, and while she is longing for the teacher, the Cub is plucked in an examination for the army. Soon afterwards he has something as like brain fever as his constitution admits of, and his personal appearance is improved by his illness. At least we suppose that is what we are meant to gather from the following remarkable sentence:—

His figure was slight as yet, but on the whole looked a fair reproduction of some old Norse stock. He would have made a capital Balar, given the large limbs of that Hyperborean Apollo, but had a certain languid ease, out of place in one so much like a Bare Sarker, yet was not unbecoming in a young gentleman of the nineteenth century.

This reads like an unfair reproduction of some of Mr. Kingsley's old Norse stuff, but the reference to our friend the Bare Sarker is welcome as a momentary escape from the usual level of the story. The Cub is sent to Ireland for the benefit of his health, and it might be expected that the author would grow less tedious under the influence of Irish air. An ordinary novelist would be tempted to borrow animal spirits from an imitation of Lever or Lover, but Mr. Belcher never loses sight of his purpose. He is careful to impress us with the belief that Irish humour is a myth, and that dirt and drink are the only characteristics of the island. The town of Knockdownmore is thus described:—"Its chief feature is a bridge. Without this bridge nothing would be left for the Knockdownmoreites but to hang themselves from sheer inanition." By inanition it is improbable that Mr. Belcher means starvation, though to hang oneself from starvation would be a very Irish way of solving the riddle of the earth. Knockdownmore, slovenly as it was, was the residence of Miss Evelyn Blake, the heroine of this story. Miss Blake was well worthy of the Cub's affection. "She was the kind of girl that has a quiet way of making love to any presentable man without the slightest glimmer of consciousness that very few men can stand being made love to by the Eva Blakes of the world." This unconscious creature has a way of kissing the Cub, and of employing "an elevation of her pretty eyebrows, and a contraction of the eyelid, the left eyelid," which must have done a good deal to relieve the tedium of Knockdownmore. Her uncle, Colonel Blake, runs the other bores of the story very hard; indeed we incline to think that he is the most musty and repulsive specimen in the collection. He is a learned campaigner who translates his talk into Greek, and quotes no less assiduously than the Doctor. By a rare stroke of genius the writer has contrived to keep either the Colonel or the Doctor eternally on the stage, and sometimes they are both present together, so that we can never escape from shreds of the Latin grammar. The other inhabitants of Knockdownmore are squireens and louts. Evelyn makes love to one of them, though he is not very presentable, and there are some dull adventures at a ball, where drunken men exchange blows and apologies. The Squireen takes Miss Blake and her cousin for a cruise by themselves in a yacht, proposes, is rejected, drinks himself stupider than he was before, and allows the yacht to be nearly run ashore. The characters are rescued by a man-of-war's boat commanded by Archie Lambert, a school companion of the hero, and Eva makes a good deal of love to him. She had already displayed her piety by "singing a little hymn" in the cabin of the yacht during the storm. Meantime the Doctor marries the hero's mother, and he and Eva are separated for two years.

As the Cub has grown too old to be crammed, the author now feels inclined to chastise the folly of rash speculation. So a wholly impossible stockjobber and member of Parliament is brought on the scene. We are asked to believe that this man was a cunning hypocrite who thought he could gain public confidence by winning the friendship of the foolish head of Cramleigh College. Of this hypocrite the author tells us that his vice was too subtle "to be hapdled successfully within the compass of three acts. The lines of it are not sufficiently deep, the features not sufficiently broad." There is nothing peculiarly "fine" in paying for a testimonial to a popular preacher with the view of borrowing some of the splendour of his sanctity, and all his wife's money. This is the delicate stratagem of Mr. Farindon, M.P., who invests the money in some bubble company. The bubble bursts, and the Doctor is considerably improved as a character by a paralytic stroke. He quotes Horace no more, but sinks into ordinary idiocy. The Cub marries Eva, who had failed to induce "any presentable man" to come forward in earnest.

This is the sum of the story; and it is difficult to see what excuse can be made for a tale which drags us through such dreary scenes and into such tedious company. There are cubes, silly widows, vulgar flirts, drunken squireens, and foolish pedants in real life, and their adventures probably have some feeble interest for themselves and their relations. But it is not easy to see what class of readers can be amused by a servile copy of their proceedings. Mr. Arnold says, in reference to Heine's bitter pictures of society, that it was to make us forget such barren nothings that "God gave the poet his song." Mr. Belcher is no poet, and the only gift he has shown is that of sufficient perseverance to fill three volumes with twaddle. Still he is responsible for the use he makes of this talent. It would be far better to hide it away for ever than to go on producing stories so ineffably tedious and depressing as *Cramleigh College*.

GERMAN LITERATURE.

FEW, it is probable, among the readers of Goethe's biography and correspondence have hitherto believed in the purely Platonic character of his attachment for Frau von Stein.* One of the highest living authorities on all subjects connected with Goethean literature now comes forward to maintain the proposition; and if he cannot be said to have produced much testimony in its favour, he is at all events successful in showing that there is just as little to be urged against it. The question seems one eminently adapted for being let alone. Goethe's letters to the object of his attachment are as interesting under one hypothesis as the other, and are reconcilable with either. The tone of Weimar society is not materially affected by one *liaison* more or less; and, take what view we may, Frau von Stein's husband appears equally a nonentity. So little, in fact, does he appear at all, that sterner moralists than the Weimar circle might feel tempted to apply the maxim *De non apparentibus et de non existentibus*. If people will form an opinion on the matter notwithstanding, they must at least bear in mind that half the documentary evidence is missing. Frau von Stein preserved Goethe's letters with religious care, but reclaimed and destroyed her own. No hint, at least, is given of their existence. The loss is much to be regretted, not for their possible bearing on the scandal of her day, but inasmuch as they would have materially contributed to determine the actual extent and nature of her influence on Goethe. Herr Düntzer rates this very highly, and is equally confident of its ennobling and purifying effect. He sees in her Goethe's Egeria, the guardian angel who guided and chastened the impulses of his versatile temperament, and educated him into that lofty conception of feminine dignity and purity typified in his *Iphigenia* and *Tasso*, dramas undoubtedly planned during the period of his attachment for her. A few specimens of her letters to him would contribute more than pages of speculation towards a decision of this question. Although, however, Herr Düntzer has not been able to recover these lost treasures, the assistance of Frau von Stein's family has enabled him to present us with several specimens of her communications to less interesting correspondents. These have been of much service to his book, which in the dearth of such material would have been little else than a commentary on Goethe's letters to her, and even now is hardly readable or intelligible without constant reference to them. Some of the new letters are very interesting, especially those from the Duchess of Weimar, whose regard for Frau von Stein seems to have been strong and genuine. The heroine's own letters, with every allowance for their usual reference to disagreeable business, still appear comparatively commonplace, and suggest that the secret of her influence over Goethe consisted less in moral or intellectual distinction than in her personal fascination, assisted by her slight seniority to himself, and her habituation to what was to him the novel sphere of Court life. According to Herr Düntzer, the ultimate rupture of their intimacy was occasioned by the Platonic yoke imposed by the lady having become intolerable to her adorer; this solution is as defensible as the more ordinary one, and not more so. There can be little doubt that, from whatever cause, Goethe had become weary of Frau von Stein before his departure for Italy; absence, new influences, and his own surprising mental development completed the estrangement, and Frau von Stein's inability to accommodate herself to the new condition of things precipitated the breach. Goethe did not acquit himself to advantage here; he must have felt very hard driven indeed when he could find no better answer to what must be presumed to have been a passionate appeal than to reproach the writer with her addiction, in spite of his remonstrances, to that pernicious beverage, coffee. It is impossible not to sympathize with Frau von Stein's laconic commentary—"O!" The second volume will comprise her biography after the death of her husband (1793), and will, it is announced, contain a much greater amount of unpublished correspondence than the present.

The second series of *Sketches of St. Petersburg Society*† would be more likely to attain their object if this were less obtrusively conspicuous. They are professedly the production of a Russian; such may be the case, but, if so, it is a Russian who thinks and feels as a German, and who derides the idea of his own country ever developing an indigenous civilization. It is improbable that any genuine Russian would display such deficiency in patriotic feeling, and still less likely that he would be inspired by this writer's determined animosity against France. The work is indeed in great measure a denunciation of French influence as a source of social corruption, in support of which the old story of Pushkin's death in a duel with a French officer is recounted at considerable length. The animus thus evinced deprives the writer's statements of much of the weight to which they might otherwise be fairly entitled when he descends to contemporary matters. It is impossible to resist the inference that German influence must be much on the decline in Russia to account for such bitterness of feeling. Too much importance, however, must not be accorded to this circumstance, as, whatever the tone of feeling in Russian society, the political course of the country will unquestionably be determined by her interests, and her alliance will always be attainable by the highest bidder. The last chapter of the work is devoted to the St. Petersburg Academy, of which a very unfavourable account

* *Charlotte von Stein, Goethe's Freundin*. Ein Lebensbild, mit Benutzung der Familienpapiere entworfen von H. Düntzer. Bd. 1. Stuttgart: Cotta. London: Williams & Norgate.

† *Neue Bilder aus der Petersburger Gesellschaft*. Von einem Russen. Leipzig: Duncker & Humblot. London: Asher & Co.

is given, visibly tinged, however, with the same prejudice as all the rest. There may be, and probably is, much truth in all the writer's assertions, political and otherwise, but it will not be safe to accept any of them until confirmed from some less suspicious source.

The administration of Alsace* by its conquerors, both before and since the final cession of the province, served to raise many delicate problems both in international law and in general ethics. Professor Löning, of the University of Strasburg, has prepared a very temperate and well-digested account of these various questions as they arose, and of the processes of reasoning which on each occasion conducted the German authorities to a decision in their own favour. The book is an interesting example of the twofold tendency so frequently remarked as characteristic of our times—on the one hand, to reduce as far as possible the pressure of hostilities upon the private citizen: but, on the other, to curtail in like proportion his opportunities of taking a part in the defence of his country. This tendency is evidently very convenient to States where every able-bodied man is or may be made a regular soldier; as this is not the case in England, we can but trust that our jurists and diplomatists will be careful of countenancing any reasoning, however specious, which tends to restrict the formation and free action of irregular troops. The behaviour of the invaders shows that they dreaded the general resistance of the population more than anything else. Not the least inconvenience entailed by it was the exasperation produced by the measures of repression and retaliation to which they were compelled to have recourse, the memory of which may be said still to fight for France after the overthrow of her armies. We see no reason for concluding that these severities were in excess of what any other conquerors would have resorted to under similar circumstances; but their effect not the less emphasizes the hard fact that, when territory is at stake, it is the interest of the defeated party to embitter the struggle as much as possible. The annexation also raised a number of most interesting if less exciting questions, legal, financial, commercial, which are discussed by Dr. Löning with excellent temper and admirable perspicuity.

Adolf Ebert's History of Latin Christian Literature† is designed as the first volume of a complete history of the mediæval literature of Western Europe. It is consequently written rather from the literary than the theological point of view, and will appear an inadequate performance if judged with reference to the special needs of theological students, but is perhaps on that account all the better calculated to attract as well as instruct the general reader. It is also not professedly confined to works relating to religion, though practically almost restricted to this branch by the poverty of early Christian literature in every other. From the fiery outburst of the new element in Tertullian, the story is pursued until its almost total stagnation in the age of Charlemagne. The animation and energy which excite our admiration down to the fall of the Roman Empire had arisen from an influx of ideas new to classical literature, which by the conclusion of the last great ecclesiastical controversy had become totally exhausted. Its gradual renovation and transformation from a theological literature confined to a single dead language to a general literature vested in a living speech will form the subject of the second volume, in which especial attention will be given to the influence of Church hymns on the development of popular vernacular poetry. The present volume is prefaced by an able survey of the causes of the dissemination and ultimate triumph of Christianity under the Roman Empire.

Lieutenant Janke's book of travel‡ scarcely bears out the promise of the title-page. We are led to expect a work replete with professional information, and find instead the tour of a man of taste and letters, who details the ordinary incidents of an Italo-Levantine tour in a pleasant scholarly fashion, and only seems strangely unaware how little he has to tell that has not been already told. At the end of the book, however, we do meet with serviceable technical matter in the shape of an appendix on the organization of the Italian army. The writer speaks very favourably of the zeal and intelligence of the Italian officers, and of the excellence of the military arrangements in many respects. The chief drawback seems to be the condition of the fortresses, to place which in a proper condition would require an outlay far in excess of the resources of the nation.

That indefatigable traveller and voluminous author, Dr. Adolf Bastian§, proceeded to Lower Guinea last year as pioneer of the German exploring expedition which has selected that little known region as its basis of operations. After remaining a short time he was joined by Dr. Güssfeldt, the working head of the expedition, and returned after seeing due provision made for the successful execution of the enterprise. Everything has evidently been most carefully organized, and the undertaking wears rather the aspect of a permanent establishment in the country for scientific purposes than of a mere incursion of explorers. It only remains to be seen whether the audacity of the travellers will equal their

forethought, and whether they will venture sufficiently far from their carefully secured base to rival the fame of a Schweinfurth or a Livingstone. The shortness of Dr. Bastian's stay and the object of his mission were unfavourable to any extensive explanations on his own part. His personal narrative is nevertheless very interesting, and is composed with a clearness and simplicity strongly in contrast with the confused accumulation of valuable but indigested facts, chiefly derived from old travellers and geographers, which make up the larger part of his volume. Though claimed by the Portuguese, Lower Guinea north of the Congo appears to enjoy political independence, only slightly restrained by the influence of the numerous European factories. These mostly belong to the Dutch African Trading Company, which finds it however advantageous to employ Portuguese as its subordinate agents. The relation of the Europeans to the natives is in general amicable and mutually advantageous, the slave trade being now extinct, and no great negro power like Dahomey or Ashantee existing that might be capable of rendering itself troublesome. In fact, the excessive subdivision of the aborigines into small independent tribes is one of the difficulties of the traveller, each chief requiring to be propitiated by a separate negotiation. Another obstacle is the impression prevailing among them that all white men are literally brethren, in consequence of which any European is liable to be detained and held responsible for debts contracted by perfect strangers, which he is expected to discharge for the credit of the family. Human sacrifices like those of Ashantee and Dahomey seem to be unknown, but a still more devastating scourge is the reference of most physical disorders to witchcraft, and the continued slaughter of persons indicated by the priesthood as the culprits. The religion of the country is the grossest fetishism; the Catholic missions seem to have disappeared without leaving a trace. Dr. Bastian met with the utmost kindness and civility both from the Dutch and the Portuguese trading agents, and there seems every reason to regard the choice of Lower Guinea as a point of departure as highly judicious. We must suppose that one of the first endeavours of the expedition will be to open up the Congo, the least known of the great rivers of Africa.

The third part of Von Heuglin's narrative of the German expedition to Spitzbergen* is devoted to natural history. The fauna of that inhospitable region is richer in mammalia and birds than might have been expected; and the same remark would probably have held good of the lower orders of animal life had time and opportunity for investigation been available. The defectiveness of the chapters on botany and geology no doubt admits of the same excuse. Perhaps the most interesting part of the book is the account of the vast accumulation of drift-wood found far inland, testifying at once to the direction of oceanic currents and to the upheaval of the land during the present geological epoch. These heaps have no connexion with the vastly more ancient deposits, formed *in situ*, of fossilized timber in Greenland.

The administration of our sanitary laws† is so continually affording matter for complaint and cavil that it is with a pleased surprise that we find it actually an object of admiration to an intelligent foreigner. It may well be that we ourselves are unduly exacting, and, in our impatience at the numerous shortcomings of our system, fail to consider the large amount of good which it accomplishes. Dr. Finkelburg's favourable opinion of English sanitary legislation is in some degree due to the important part reserved by it for members of his own profession. He is also a strong advocate for local self-government, and perceives clearly that a task involving such endless minutiae as the care of the public health is one in which the public itself must take an active interest, and which cannot be performed by the most zealous of centralized administrations. At the same time he fully allows that some control from an external authority is essential to overcome the occasional obstructiveness of local bodies, and he highly approves of the recent English legislation with this object. His work is in the main a history of our sanitary laws since attention was first directed to the subject by the cholera of 1832, with an appendix giving a comparative view of the legislation of other civilized countries, and an exhortation to his countrymen to uphold the Teutonic principle of reliance on local management, rather than the dependence of Latin races on the machinery of an organized bureaucracy.

Dr. H. Duntzer must, as things‡ go, be reckoned among the more conservative critics of Homer, as he postulates no more than four Homers, respectively authors of the *Mûve* and the *Iliad*, whose juxtaposition has made the *Iliad*, and of an *Odyssey* and a *Telemachiad* as constituents of the second great epic. All these compositions, he considers, originated in Chios, from about a century previous to the first Olympiad until a period somewhat later than that of the institution of the festival. The writer may therefore be said to occupy a point of view equidistant from the speculations of Mr. Gladstone and of Mr. Paley.

Dr. P. Doetsch's essay on Juvenal in the character of a censor of his age§ is little more than a compilation of passages from the works of the satirist, in preparing which he has hardly been suffi-

ciently attentive to his own judicious maxim, that a satirist is inevitably an exaggerator. It is probable, however, that Juvenal's exaggeration does not so much consist in inaccuracy with respect to individual traits of corruption as in the omission of everything tending to indicate a healthy state of moral feeling. The letters of his contemporary Pliny would give a totally different impression of the age, and to obtain a faithful delineation of it it is necessary to combine the testimony of the declamatory moralist with the lettered magistrate with that of the representative "man about town," Martial.

Dr. Alexander Schmidt* may safely congratulate himself on having attained the modest ambition he professes of having in his *Shakespeare-Lexicon* produced a work useful to every Englishman. It is much more than this—a monument of taste and diligence, and, so far as we can at present judge, of copiousness and accuracy. It cannot fail greatly to promote the study of the author and the critical recension of his text, while adding yet another to the numerous instances of Germany doing for us what we ought to have long since done for ourselves.

Dr. W. Wagner's agreeable little essay on Shakespeare† is principally called forth by the recent attack of the late Rodolph Benedix. It may be doubted whether it was worth while to wipe away the aspersions of a critic so unfortunately constituted as to be incapable of seeing anything admirable in the *Tempest*, especially as Dr. Wagner takes little notice of Benedix's strictures on the only side on which they are entitled to attention, the fitness of Shakespeare's plays for the modern stage. His own remarks, however, if not profoundly original, are almost always just. In speaking of *Troilus and Cressida* as probably a hasty work for stage purposes, he seems to forget that it alone among Shakespeare's pieces was never acted before publication. We could wish he had found more to say about Shakespeare's comedies.

With Assistant Lecturers in all the principal Departments.

The next SESSION will commence on October 6.

Candidates for Admission must not be under fourteen years of age, and those under sixteen will be required to pass a preliminary examination in English, Arithmetic, and the elements of Latin.

Prospectuses of the several departments of the Day Classes, the Evening Classes, and the Medical School, and of the Scholarships and Entrance Exhibitions tenable at the College, will be sent on application.

J. HOLME NICHOLSON, Registrar.

QUEEN'S UNIVERSITY IN IRELAND.

QUEEN'S COLLEGE, Galway.—The SESSION 1874-5 will commence on Tuesday, October 20, when the Supplemental Scholarship, and other Examinations will be proceeded with, as laid down in the Prospectus.

The Examination for Matriculation in the several Faculties of Arts, Law, and Medicine, and in the Department of Engineering, will be held on Friday, October 25.

Further information, and copies of the Prospectus, may be had on application to the REGISTRAR.

By order of the President,

Queen's College, Galway,

August 10, 1874.

T. W. MOPPETT, LL.D., Registrar.

CRYSTAL PALACE SCHOOL OF PRACTICAL ENGINEERING. Principal—Mr. J. W. WILSON, Assoc. Inst. C.E. The NEW TERM will commence on Monday, September 7. Candidates for admission will be passed on September 3, 1, and 5, and will be taken in the order of preliminary application, the number to be accepted to be limited. Students can reside in the office of the School of Art, Science, and Literature, in the Library near the Exchange Court, where Prospectuses can be obtained.

By Order of the Committee.

F. K. J. SHINTON, Sec. Library Dept.

LEAMINGTON COLLEGE BOARDING HOUSE.—The

NEW TERM commences on September 22. Inclusive Terms from 70 to 90 Guineas. For Sons of Professional Men (Bachelors &c.). There is a special Tutor and separate Dormitory, &c., for small Boys. For particulars apply to the Rev. J. Wood, Head-Master, or to the Rev. J. S. Birch, Chaplain and House-Master.

FULLANDS, TAUNTON.—OXFORD MATRICULATION and REVISIONS, and CAMBRIDGE PREVIOUS EXAMINATIONS.—PRIVATE TUITION, by graduates of Oxford and Cambridge, for the Universities, the Indian Civil Service, Woolwich, and other Examinations generally. The next Term will begin on September 21. For Prospectuses apply to the Rev. the SECRETARY.

FULLANDS SCHOOL, TAUNTON.—The aim of Fullands School is to provide for the SONS OF GENTLEMEN a thoroughly good Education, similar to that given at the Public Schools, but at a moderate cost.

Principal,

Mr. REED, Fellow of the College of Preceptors, London.

Fees—Principal.

HEAD MATHEMATICAL MASTER.—REV. WILLIAM REED, M.A., St. John's College, Cambridge, 16th Senior Optime, Tripos, 1850.

HEAD CLASSICAL MASTER.—FRANCIS REED, Esq., B.A., Exeter College, Oxford.

There are Three School Terms in the year, of an average duration of thirteen weeks each. The Michaelmas Term begins on September 21, 1874.

Prospectuses may be obtained on application.

JERSEY.—ST. AUBIN'S SCHOOL. Head-Master—Mr. J. E. VIBERT, M.A., M.C.P. Gentle climate. Healthy situation. Special attention to Modern Languages. Prospectuses on application.

PRIVATE TUITION FOR ARMY, COOPER'S HILL, CIVIL SERVICE, WOOLWICH, and UNIVERSITIES.—REV. DR. HUGHES (Waring, Cam.) has just over 300, and occasionally has VACANCIES. Also quite distinct young Boys—Eding, W.

ARMY, CONTROL, CEYLON WRITERSHIP, INDIAN FORESTS, and ALL DEPARTMENTS of CIVIL SERVICE.—MR. W. M. LUTFON, Author of several Monographs on Competitive Examinations, has for many years successfully PREPARED CANDIDATES for the above.—Address, 9 Rathbone Place, Oxford Street.

SUMMER TRIP TO HOLLAND AND BACK in FOUR DAYS, allowing time for a visit to the interesting Cities of Amsterdam, Haarlem, Hague, Dordrecht, and Utrecht. The Favorite Steamers *Amsterdam* and *Non-stop* leave London alternately every Wednesday and Saturday for Rotterdam, embarking Passengers from Brunswick Wharf, Blackwall. Return Fare: Saloon, £1 14s.; Fore Cabin, £1 4s. 6d. (including Steward's Fee, but exclusive of Provisions supplied on board). Apply at Chaplin's Universal Office, Regent's Circus, W., or to Phillips, Graves, Phillips, & Co., St. Dunstan's House, Cross Lane, Great Tower Street, E.C.

SUMMER TRIP TO SWEDEN AND BACK in SEVEN DAYS, allowing time for a visit to the magnificent Waterfalls at Trollhattan, the beautiful lakes Western and Western, with unrivalled surrounding scenery. The twin steamers *Louisa Ann* and *Mary* are despatched from London, Millwall Docks, for Gothenburg every Friday alternately. Fare: Saloon, £3 3s.; Return Ticket, available for one month, £2 11s. 6d. Provisions obtainable on board at tariff prices. Apply at Chaplin's Universal Office, Regent's Circus, W., or to Phillips, Graves, Phillips, & Co., St. Dunstan's House, Cross Lane, Great Tower Street, E.C., and 30 South John Street, Liverpool.

THE Rev. L. HENSLEY, Vicar of Hitchin, Herts, formerly Fellow and Assistant Tutor of Trinity College, Cambridge, receives a few PUPILS to prepare for the University, and his VACANCIES for September 7.

INDIAN CIVIL ENGINEERING COLLEGE, Cooper's Hill.—CANDIDATES for Admission are specially PREPARED by the Rev. Dr. WOLFEY, M.A., M.D., formerly Professor of Mathematics, Addiscombe and late Examiner of Candidates for Appointment in the Indian Civil Engineering Service and Indian Telegraph. Address: 87 High Street, London, E.C.

A MAINTAINED CLERGYMAN, Incumbent of a small Parish near Oxford, formerly Tutor in several Families of Distinction, and late Master in a Public School, receives three or four PUPILS to prepare for the University. Terms and references on application. Address: Rev. A. OXON, care of Messrs. Masters & Co., 74 New Bond Street, London.

66 AVENUE ROAD, London, N.W.—The Rev. NATHANIEL JENNINGS, M.A., receives PUPILS for UNIVERSITY COLLEGE, Oxford, for its School, and also for the University of Cambridge. The Metropolitan Railway makes the College easily accessible in all kinds of weather. Terms on application.

AN OXFORD GRADUATE, in Honours, an old Marlburian, Blackham Row, and former scholar of his College, receives PUPILS. Address: Rev. W. F. BARNES, Great Marlborough Street, London.

LADIES' SCHOOL, TAUNTON, for the DAUGHTERS of GENTLEMEN.—This location, given in a thoroughly sound and useful course, is especially adapted for the study of those branches of Learning which are required in the Education of ladies. The real work done is testified by the High Prize in the Oxford Local Examinations, and by a summary in the Standard of 2nd Prize in the Senior Oxford and the Junior in the Junior Examinations in 1871, and all the Examinations of the College at Taunton. The College is situated in a First Class building, and the certificates are gained by the Pupils. The College is open for English Subjects at both Examinations. For particulars, forward an application to Miss BARNES, Mary Street House, Taunton. The next term begins on September 1st.

TO INDIAN RESIDENTS and GUARDIANS—A LADY, with unexceptionable references in London and Liverpool, desires the entire charge of TWO LITTLE GIRLS who would receive every kind of instruction in a healthy country residence within any reach of Sea bathing. Inclusive to me £100 each.—Address: H. WATSON, 22, Mount Vernon Street, Liverpool, or 10, Regent Street, London.

BRIGHTON COLLEGE—THE FRENCH and GERMAN MASTER.—Mr. C. H. WALLACE, who speaks French fluently and can be thoroughly relied upon without interruption to other work. The College is situated in a healthy and pleasant position, and is open for the reception of Pupils. For particulars, forward an application to Mr. WALLACE, 22, Mount Vernon Street, Liverpool, or 10, Regent Street, London.

MORNING or DAILY GOVERNANCE—A LADY of experience desires a REFUGIUM for the September term. The neighbourhood of St. James's Park and Shepherd's Bush preferred. The French, English, Music, Drawing, and all the latest and most improved methods of instruction. Address: Miss T. L. T. 21 Great Russell Street, Bloomsbury, W.C.

PUPILS WANTED. MACLURE & MACDONALD, Lithographers to the Queen, having completed their new and spacious buildings in Queen Victoria Street, & wish to have removed to the new premises a few well educated young Gentlemen as PUPILS. Applications with references showing capacity, and stating age, may be made to the above address. A moderate remuneration will be paid.—Lithographic Office.

SANATORIUM—SUDBROOK PARK, Richmond Hill.—Physician: Dr. EDWARD LANE, M.D. For Invalids and those requiring rest and change. Turkish Bathing on the premises.

COMPRESSED AIR BATH—An important Remedy in various forms of Asthma, Bronchial Affections, the Rheumatism, and Anæmic conditions of the Blood.—TOWNSEND HOUSE, GREAT MALVERN. Physicians: R. B. GRINDROD and C. F. GRINDROD.

BRIGHTON—BEDFORD HOTEL—Facing Sea and Esplanade.—Near the West Pier. Central and quiet. Long established. Suites of Rooms. Refreshment Coffee Room for Ladies and Gentlemen. Sea Water Service in the Hotel. ROBERT PARK, Manager.

ILFRACOMBE HOTEL, Ilfracombe, North Devon.—Delightful Location. Beautiful Scenery. 250 Rooms. Appointments perfect. Cuisine excellent. Wines choice. Accessible from all parts by Steam and Rail. See Time Table.

E. DENT & CO., 61 Strand, and 31 Royal Exchange, Manufacturers of CHRONOMETERS, WATCHES, ASTRONOMICAL and JEWELLERY. Clocks, to Her Majesty, the Prince of Wales, and H.M. the Emperor of Russia. Makers of the Great Clock of the House of Parliament, and of the New Standard Clock of the Royal Observatory. Catalogues on application. E. DENT & CO., 61 Strand, 31 Royal Exchange (adjoining Lloyd's) and Factory, Savoy Street, London.

MAPPIN & WEBB'S

A 1 SPOONS and FORKS.

GUARANTEED to LAST

TWENTY YEARS.

(PATENTEE OF THE "CLUB" BOTTLE HOLDER.)

The London and County Bank and its Branches will, on behalf of the above Committee of Management, receive applications for the debentures, and will, on the day of the issue, pay the amount of the debentures.

ABRIDGED PROSPECTUS

This Trust is constituted to meet the requirements of investors and others who look for absolute security and a moderate but certain rate of interest upon the sum invested.

The property of the Trust will consist solely of Freehold Land and Buildings.

It will be seen that many persons are desirous of having their money invested in a safe and profitable manner, and that they are desirous of having their money invested in a safe and profitable manner, and that they are desirous of having their money invested in a safe and profitable manner.

The debentures will be a first charge on the property, and the income of the Trust for a fixed term of years, or for the life of the holder, or for the life of the holder, or for the life of the holder.

The shares will be high in value, and the interest will be paid in cash, or in the form of a dividend, or in the form of a dividend, or in the form of a dividend.

Applications for shares will be received at the offices of the Trust, and the amount of the shares will be paid in cash, or in the form of a dividend, or in the form of a dividend, or in the form of a dividend.

Applications for shares will be received at the offices of the Trust, and the amount of the shares will be paid in cash, or in the form of a dividend, or in the form of a dividend, or in the form of a dividend.

Applications for shares will be received at the offices of the Trust, and the amount of the shares will be paid in cash, or in the form of a dividend, or in the form of a dividend, or in the form of a dividend.

SPAIN.

WHEN some Carlist officer indulged himself and gratified his followers and superiors by murdering a German prisoner, he can scarcely have anticipated the political consequences of a pleasant and familiar crime. The recognition of the Government of Madrid by several European Powers has undoubtedly been accorded at the instance of the German Government, which has justly resented the outrage perpetrated on one of its subjects. Don CARLOS indeed has been advised to assert that Captain SCHMIDT was taken with a revolver in his hand at the head of a body of incendiaries. To any person better acquainted with the world than a Legitimist Pretender it is simply incredible that a German officer of reputation in the position of a non-combatant should have employed himself in wantonly setting Spanish houses on fire. In the same sentence Don CARLOS describes Captain SCHMIDT as a spy, without understanding that the two accusations are inconsistent with one another. Spies pursue their avocation within the enemy's lines in the most peaceful and unobtrusive manner. It would not answer their purpose to collect illicit information with a revolver in one hand and a torch in the other. Captain SCHMIDT's countrymen are with good reason convinced that he was put to death because he was a German, and perhaps also because he was a Protestant. Some English partisans of Carlist orthodoxy have characteristically taunted the victim with a supposed recantation which the murderers may probably have tried to extort. As far as England is concerned, there is a certain awkwardness in the choice of a time for recognition; but if the measure is agreeable to Germany as well as to Spain, it may perhaps be contended that a double object has been attained. Patriotic Englishmen are accustomed to restrain the impatience which is naturally produced by the habitual and ostentatious timidity of successive Ministers. For many years past the Foreign Office had regulated its policy by the fear of giving offence, and the result might have been anticipated by any observer of the tendency of the same kind of nervous solicitude in private life. The recognition of the Spanish Government has probably been delayed in deference to France, and it is at last, without any change of circumstances, granted to conciliate Germany. It happens that Don CARLOS has lately attained a degree of success which may probably be the final limit and turning point of his enterprise. Although the atrocities perpetrated under his authority have provoked just indignation, the Madrid Government has certainly not acquired increased solidity by the recent disaster. The question whether a new Government is to be recognized ought to be considered with exclusive reference to facts, and as far as possible independently of moral preference or disapproval. If a foreign nation deliberately prefers an absolute monarchy or the supremacy of a Jacobin Club, it is entitled to exercise its discretion without external control. The Spanish Republic, if there is a Republic, is neither so bad nor so good as to form an exception to the general rule.

The meaning and value of recognition are not easily defined. It has not been disputed or doubted that the actual Government of Madrid has enjoyed nearly all the rights which belong to a Sovereign State. Its flag has been known on the sea after as well as before the abdication of King AMADO; and during the whole interval the Ministers of England and of other Powers have continued to reside at Madrid, and to hold constant intercourse with the Government for the time being. The German Government is true, professed entire impartiality between the

Madrid authorities and the Carthagena insurgents; but the English Admiral, when he had become possessed of the ships which had been taken from the rebels by a German Commodore, was ultimately directed to return them, not to the belligerent who had been last in possession, but to the Government of Madrid as the representative of the nation. It was impossible to express more clearly the opinion that Carthagena was in rebellion against a Government which for the purpose must have been regarded as legitimate. The Carlist insurrection is more formidable, and it has lasted longer; but the recognition is equivalent to an admission that Don CARLOS is, in spite of his own sweeping assertion, not King *de facto* even in the provinces of which he holds military occupation. Whether he is King *de jure* is a question which exclusively concerns the subjects over whom he seeks to establish his right. The Spanish Ministers in London and other capitals will henceforth be received in an official capacity, and probably diplomatic communications will be more conveniently transmitted. It may be hoped that the relations which have been at last re-established will not be hastily disturbed. Nothing is more probable than a further change in the form of government in Spain; but it will be quite unnecessary to suspend diplomatic intercourse because the PRESIDENT of the Republic may possibly call himself Regent for Don ALFONSO. Lord DERBY exhibited sound judgment in falsifying the rumour that he had recommended the convocation of a Cortes as the condition of recognizing a Government which has not yet received Parliamentary approval. Marshal SERRANO is obeyed throughout all the provinces which are not controlled by the Carlists, and he disposes of an army which probably by this time numbers 150,000 men. The same ruler, or a successor, will be equally entitled to represent the nation if he thinks fit to assume another title with or without the sanction of a Cortes.

It seems not altogether improbable that Provisional Governments may become permanent in more than one European State. In different countries and ages temporary makeshifts have often grown into lasting institutions, as when the Roman commander of the army and Chief of the Senate assumed the modest title of Emperor, which is still, after nearly two thousand years, coveted by the most ambitious founders of dynasties. In India, hereditary Ministers, such as the Peishwa of the Marhattas, repeatedly acquired independent sovereignties, while they retained the title of their original offices. The French Septennate and the Government of Marshal SERRANO are tolerated by all parties because they represent a truce or compromise. The institution of universal suffrage, which threatens to render government impossible, is sometimes content to suspend itself on condition that it is not formally disavowed. The democrats in many parts of Europe are obstinately opposed to the kingly title, which AUGUSTUS himself could not safely have assumed in Rome. On the other hand, the upper and middle classes are with good reason unanimously hostile to a Republic in which, as they apprehend, their deadliest enemies might at any time become supreme. As all parties naturally shrink from civil war, nothing is more convenient than the continuance for an indefinite time of an interregnum which provides for social order, without giving either Royalists or Republicans a decisive victory. PAUL, who had the merit of inventing or applying the system of provisional government, might perhaps not have been assassinated if he had been content to dispense with a more definitive arrangement. Experience has shown that nations almost invariably fail when

they attempt deliberately to provide themselves with constitutions; while, on the other hand, temporary expedients are almost always recommended by considerations of convenience. The principal objection to Septennates and other Provisional Governments is that they constantly fall into the hands of soldiers. The Assembly which has for the first time since the fall of Louis PHILIPPE striven vigorously to assert Parliamentary supremacy in France seems to be, at least in the estimation of foreign observers, thoroughly discredited. In Spain representative government has proved an entire failure; and if a civilian were now President of the Republic, he would be entirely dependent for the maintenance of his authority on the chiefs of the army. It is fortunate that some military rulers are, like MACMANN and SERRANO, moderate in the exercise of their power.

Any error which may have been committed in the selection of a time for recognition will be readily condoned if the courteous advances of the Great Powers should coincide with a successful movement against the Carlists. It seems that the long period of inaction which succeeded the discomfiture of Estella has at last closed, and that General ZABALA and his lieutenants are moving on the Carlist positions. The interval has probably been employed in the provision of military stores, and in introducing some elements of discipline among the raw recruits who form the bulk of the army. If it is true that General LOPEZ DOMINGUEZ has been appointed Minister of War, he will probably be as efficient in directing the operations of the armies as in immediate command. General PAVIA, on whose energy much reliance is placed, has apparently not yet recommenced the campaign. Notwithstanding the partial successes of the Carlist leaders, the difficulties of SERRANO are much less than those which CASTELAR was compelled to encounter a year ago. The Communist insurrection finally subsided with the fall of Carthagena, and the Republicans deserve credit for the suspension during the continuance of civil war of their agitation against the Government. The partisans of Don ALFONSO have every reason to wait with patience for a future opportunity. It is advantageous to their cause that a Provisional Government should be charged with the suppression of the rebellion; and they have many friends among the general officers of the army. A Pretender who is still a minor can scarcely fail to profit by a delay which will eventually remove his disqualification; yet it is by no means certain that the Provisional Government will make way for any claimant of the throne. The war is so far convenient that it furnishes the PRESIDENT with an excuse for indefinitely adjourning the convocation of the Cortes. Spain stands in no urgent need of eloquent speeches, and a new democratic Constitution would be a wholly superfluous composition. The hopes which have been excited by the recognition accorded to the Government by Germany, England, France, and Italy, may perhaps be disappointed; nor is the hesitation of Russia seriously important. Few Spaniards can have desired the intervention which was not long since described as probable; but it must have been mortifying to be constantly reminded that in the opinion of Europe the existence of the Republic was provisional and precarious.

BRIGHTON AND SHEFFIELD.

MR. FAWCETT'S old supporters at Brighton have been paying him a compliment which he amply deserved. They have been holding a meeting to express in a public and formal manner their regret that he is no longer their member, and their congratulations on his having so quickly found another seat. No one has shown more independence in Parliament than Mr. FAWCETT, and his independence has been of the only sort possessing much real value, that which springs from a man's having with patience and labour thought out and worked out subjects for himself. In return Mr. FAWCETT had an opportunity of gratefully acknowledging how much he owed to Brighton, where he found nearly ten years ago a constituency willing to give a fair trial to a stranger, to a young man almost unknown, to a man not rich, and to one suffering from an infirmity which seemed to doom him to a life of inactivity. Mr. FAWCETT triumphed over this great obstacle with a courage which excited the admiration and respect of men of all parties, and he made a name and position for himself by the course he took and the resolution he showed in dealing with questions of considerable importance. His Brighton friends more especially dwelt, in addressing him, on the

part he had taken in helping forward the measures by which the Universities were relieved from tests, on his indefatigable endeavours to awaken public attention to the importance of Indian affairs, and on the amendments he had endeavoured to carry when the Reform Bill was under discussion. Mr. FAWCETT, in reply, said that he had found considerable indifference and apathy about India in the House of Commons, but that in this respect the House of Commons did not represent the country, for during his recent contest at Hackney he had discovered that nothing had been more beneficial to him than his reputation for having given much time and thought to Indian affairs. The divergence which Mr. FAWCETT thought he perceived between the House of Commons and the constituencies as to the interest attaching to problems of Indian government is, however, in the main imaginary. Members are as well aware as electors that it is very important to understand Indian questions, but they are also aware that it is very difficult. They have the good sense not to meddle in matters which are beyond them, and a mistake as to which may cause incalculable misery to millions of human beings of whose wants and capacities they are totally ignorant. They leave Indian affairs to be discussed by those who have learnt about India in the school of official experience, or who have, like Mr. FAWCETT, devoted years of study to the acquisition of the necessary information. Electors can show their interest in India by putting a candidate on the back who has got India up by patient study, but members can only show their interest about India by studying it for themselves; and this is a very different thing, and it is quite impossible to expect that any great number of members will ever have the courage to rival Mr. FAWCETT in his laboriously acquired knowledge of Indian questions. If a member is known to have gone through an amount of labour from which most men would recoil, in order that he may bring independent criticism to bear on the policy of the Indian Government, this is an excellent reason for a constituency resolving that he shall not lose the opportunity of rendering a great public service; but it is not possible that the common run of members should do as he has done, and nothing could be worse than if members, in order to impose on constituencies, got into the habit of dragging Indian questions before Parliament and discussing them in a shallow and artificial manner.

The reference to the University Tests Bill warmed Mr. FAWCETT into saying much about the recent contest in the House of Commons over the Endowed Schools Bill. He spoke of the measure, as many other Liberals have done, as a rallying point for their party. He had believed that the new Ministry was going to be as Liberal as could be reasonably wished; but when this Bill was proposed, he discovered that the Liberalism of the Conservatives was not to be trusted, and that they meant to have their own way in one direction at least. It is true that the Ministry gave in, and Mr. DISRAELI bungled out of his scrape by affecting not to be able to understand the clauses of a Ministerial Bill. But his party would, Mr. FAWCETT thought, force Mr. DISRAELI to make very much the same proposals in a clearer form. These proposals are, in Mr. FAWCETT'S opinion, simply monstrous. His theory is that Parliament has already adopted the principle that endowed schools, except those of comparatively recent date, belong not to the National Church, but to the nation, for the benefit of all persons of whatever creed. The Nonconformists would thus have had a handsome present made to them, and now the Conservatives, plundering and blundering, propose to rob those on whom the gift has been bestowed. The truth is rather that Parliament did by the University Tests Acts take away a part of the exclusive privileges of the Established Church, and that the theoretical arguments which Parliament in passing these Acts overruled are very much the same arguments by which the right of the Church to treat most of the older schools as Church schools is defended. On the other hand, it is equally true that these arguments are the very arguments on which the existence of the Church as an Established Church itself depends. The real question is, how far Parliament can go in breaking through the exclusive privileges of the Church without doing away with the existence of the Establishment. The principles on which a College Fellowship originally created to ensure masses being said for the soul of a founder is now given as a means of providing a young man, whatever his religious creed may be, with a comfortable income on his first start in life, might logically be extended to putting ministers of all religious persuasions into the receipt of

parochial tithes. But the nation does not wish to see any such logical extension of principles; and what is really at issue is whether the nation wishes, or wishes wisely, that these principles should be carried so far as to take away the control of the older Endowed Schools from the Church. It is inverting the use of ordinary language to speak of not taking away from the Church as a robbery of Nonconformists. The Liberal party have no cause to be ashamed of their work. They may quite fairly say that what a former generation gave to one ecclesiastical body, they wish to give to all British subjects without distinction of creed. But it is very confusing if they insist on saying that those who wish to preserve the system which a former generation has transmitted to us are robbing those who would gain by this system being abandoned. Mr. FAWCETT got on much less disputable ground when he touched on the effects which the vehement debates on the Endowed Schools Bill have had on the position of parties. Mr. DISRAELI had to break away from many of his colleagues to snuff out a Cabinet measure, and to offer a very poor sort of excuse for doing so. Mr. GLADSTONE, on the other hand, found for once an enthusiastic party behind him, and had an opportunity of convincing every Liberal that he is so very much superior to every other leader of the party that there can be no possible competition while he is there to take the foremost part, and that without him the party is shorn of half its strength. By no one does this seem to have been felt more forcibly than by Mr. FAWCETT; and he could appeal safely to the recollections of his hearers when he said that his inclination to maintain his own opinion against Mr. GLADSTONE's had been the sole cause of such differences as had existed between him and the Liberals of Brighton while he was member for the borough, and that therefore he might be trusted when he said that the history of last Session had convinced him that not only can there be no other leader of the party, but that Mr. GLADSTONE, by leading the party even when it is in opposition, could do the nation such a great service that his conscience ought to forbid him to abandon his post.

The next day Mr. FORSTER visited Sheffield, and thus gave the English public the opportunity of knowing what another Liberal of eminence had to say. But Mr. FORSTER was in a very different position from that which Mr. FAWCETT occupied at Brighton. He had not come on a serious occasion or one which would allow of party discussion. Some new schools were being opened at Sheffield, and Mr. FORSTER, as a great educational authority, was asked to be present. He came with the laudable intention of showing how pleasant he could be. He would show his new friends what a cheery good-humoured man he was, and what hearty little nothings he could produce for their benefit. About a third of his speech was accordingly devoted to himself and his coming to Sheffield, and how he felt before he came and after he had got there. He had never before been at Sheffield, which he regretted most sincerely, except that he did not regret it at all, because, if he had been there before, he could not have come for the first time on so auspicious an occasion. He had read an article in the *Pall Mall Gazette* which very nearly made him resolve not to come, but he read it through again, and was more resolved to come than ever. Now he had got there, he thought the new schools beautiful and very cheap, much cheaper than new schools had been found to be at Bradford. Recollecting in time that this contrast, though complimentary to Sheffield, was the reverse of complimentary to the borough which sends him to Parliament, he continued to keep up his character for universal pleasantness by remarking that the taxpayers at Bradford were delighted with their dear schools, and thought them an excellent investment, as they diminished pauperism and crime in a most wonderful way; and if the Bradford people were quite content, there was no reason why the Sheffield people, who had every prospect of attaining the same result at a less cost, should object. As to party politics and the present Ministry, Mr. FORSTER was not troubled with the misgivings that haunted Mr. FAWCETT. He had perfect confidence in the Duke of RICHMOND and Lord SANDHURST. They would, he was quite sure, do precisely what he would have done if he had stayed in office. He would have introduced the Scotch Educational Code into England, and so will they. He thinks the country ripe for universal compulsion, and he cannot doubt that two such excellent and sensible men agree with him. It was, as it was meant to be, a pleasant, thin, jocular speech, adapted to a provincial audience, and Liberals ought to recognize that it is by no means a bad

thing for their party that some of its leaders should study how to be conciliatory, and should make friends instead of enemies where they can. Mr. FORSTER has, however, studied the subject of education very thoroughly, and he could not make a long speech about it without saying some things that were really worth attending to. He pointed out, for example, what deserves to be borne carefully in mind when those who expect very much at first from an educational measure are inclined to grumble at the small results produced at the outset. As, under such a measure, children are brought for the first time to school at an age when they ought to have made considerable progress, they are necessarily very backward, and the standard the school attains is consequently a low one, much lower than the same school will attain when the older children have been properly trained from infancy. Mr. FORSTER also drew attention to the impossibility of allowing the distinction to remain between children who are under the Factory Acts and those who are not. If some children are allowed to work half-time and go to school for the rest after a certain age, all must be allowed to do so. Parliament, if the Government asks it, will, Mr. FORSTER thinks, be quite ready to make education compulsory up to a certain age, but after that age all children must be permitted to earn something towards their keep as well as go on with their learning. Mr. FORSTER has throughout all the recent controversies on education had the merit of trying to see the real facts with which he had to deal, and he has thus done infinitely more for education than he could have done if he had been bent on carrying out at all hazards what he thought theoretically the best system. The moderation and good sense of what he said at Sheffield were quite in keeping with all that he did in office, and he is now taking the best means of ensuring that, if he cannot himself carry out what he wishes to see done, his successors in office shall do his work for him.

ICELAND AND DENMARK.

THE people of Iceland are keenly interested in the new Constitution with which they celebrate the millennial anniversary of their settlement, though they are but partially satisfied with the actual form of the instrument. Of the purest blood of the North, their ancestors took refuge from tyranny and proselytism in the inhospitable region which has never since been without the elements of civilization and political life. The Icelanders still use the classical Scandinavian tongue which has been superseded on the mainland by more modern dialects; and Northern literature consists mainly in reproductions or imitations of the legendary poetry of Iceland. Remoteness has not exempted them from the discontent which has spread in modern times through all civilized communities. The Danes have committed in Iceland the same errors of policy which lost them Schleswig and Holstein; and, finally, the people of the island have insisted on obtaining the local independence which is now substantially conceded. The old system of monarchy was well suited to the prevention of jealousies among different States and provinces which might be united under a single dynasty. As Schleswig and Holstein were well content that their Duke should also be King of Denmark, Iceland was not conscious of inferiority to the other provinces of the kingdom. When the Danish Kings at a late period surrendered their absolute power, the Parliaments which became supreme claimed to govern in the exclusive interest of Denmark the outlying dependencies of the Crown. The innovation induced the people of the Duchies to invoke the powerful protection of Germany; and the Icelanders have ever since consistently resisted their subjection to foreigners with whom they felt little sympathy. The German Prince who has by unexpected fortune succeeded to the Crown of Denmark probably entertains no prejudice against any portion of his subjects. It would in any case have been fitting that the King should attend the secular festival of the island; and he secured a welcome by bringing with him a Constitution which seems likely to remove or largely to diminish existing grievances. Strangers can scarcely be qualified to judge of the merits of a provision for the government of a community which probably only needs a few constables and a reasonable system of parochial rating. There is little crime in an island where there is scarcely anything to steal; and the expenses of government must be within a moderate com-

pass. Home rule seems natural to an almost inaccessible country which is never likely to require an army or a navy, or to be entangled in foreign relations. To the inhabitants of the South Iceland only offers the attraction of a place of occasional summer resort, and the keener interest of its early history and original romance. Antiquaries and philologists will seldom direct their attention to the modern constitutional rights and wrongs of Iceland.

It is still uncertain whether the democratic institutions of Denmark itself will ultimately be found compatible with monarchy, or indeed with any form of orderly government. Not only semi-feudal privileges, but the rights of property, are threatened by the representatives of universal suffrage, who are said to include in their number a large proportion of Socialists. It is indeed probable that the farmers and peasantry who form the most important part of the constituency only accept the support of theoretical revolutionists with the object of extorting concessions from the landowners; but when the political omnipotence of majorities is exerted for the purpose of changing the distribution of property, it is not easy to foresee the termination of the process. The King's visit to Iceland coincides with a Ministerial change at home which will fail to restore the harmony of the Legislature. As in several English colonies, the Upper House is at variance with the Lower; and the King has hitherto, in strict accordance with the Constitution, refused to acknowledge the absolute supremacy of the more popular body. The Volkthing, like the other innumerable copies of the English House of Commons, claims the absolute control of financial policy and the substance of political power. The Landthing has under the Constitution co-ordinate authority, but the assertion of its rights finds no favour with the democratic party. In Denmark, as in many other parts of the world, political projectors may study with advantage the almost insurmountable difficulties of creating a Second Chamber which will not produce a periodical deadlock. The House of Lords only maintains itself with the aid of its historical dignity, by the painful exercise of incessant tact and prudence. The Senate of the United States alone among Upper Chambers preponderates over the Assembly which is more directly elected, both by its legal attributes and through the general estimation in which it is held. All attempts to imitate either the Senate or the House of Lords have hitherto proved abortive. The majority, when its will is once recognized as the basis of political power, cannot be made to understand the necessity of artificial checks and balances. In the Australian colonies Legislative Councils have always ultimately been forced to give way to the Representative Assemblies, and in Canada the supremacy of the House of Commons is undisputed. The Prussian House of Lords has habitually allied itself with the Crown, which is still the centre of political power. In Austria and Italy the Upper Chamber avoids envy by abstaining from any prominent share in the conduct of affairs.

Wherever Parliamentary institutions prevail, legislation is only a secondary part of the business of representative assemblies. Sovereignty rests with the electors of the Ministers who practically govern the country. In England, although the Cabinet is a Committee of both Houses of Parliament, it holds office at the discretion of the majority in the House of Commons. The assembly which can at any moment dismiss the Ministry by a vote of want of confidence is practically supreme. It is in the nature of things impossible that the power of nominating the Executive Government should be divided. In the United States the appointment rests with the majority of the population; and consequently the power of Congress is less than that of a European Parliament, although the Senate in some respects controls the prerogative of the President. Where the Ministers are not directly or indirectly selected by popular suffrage, the government is virtually absolute if they are appointed by the Crown; and it is Parliamentary when they derive their power from an elected Assembly. In France at the present moment a compromise has been established between the Assembly and the President, who holds office for a fixed term of years. Marshal MACMAHON, while he claims the right of selecting his own Ministers at pleasure, habitually defers to the opinion of the majority of the Assembly when it is plainly expressed. The majority of the Danish Volkthing in their struggle against the Second Chamber may quote the precedent of the existing English Constitution. Their claim to control the appointment of Ministers would perhaps not be seriously disputed but for the revolutionary spirit which

would probably determine their choice. In the absence of accurate and comprehensive local knowledge, no prudent foreigner would form a confident judgment on the pending controversy. The strange enthusiasm of the majority of English journalists for republicanism and universal suffrage in every country but their own receives no encouragement from the Conservative classes in any part of the Continent. The application of English constitutional analogies to the present circumstances of Denmark is only claimed by the democratic party. It is perhaps natural that philanthropic sentimentalists should prefer symmetry to expediency when political experiments are to be tried at a safe distance, and at the expense of unknown aliens.

In days gone by, when the Prussian Liberal party was engaged in active opposition to the Ministers of the Crown, Prince BISMARCK delighted to irritate their leaders by assuring them that he would have acknowledged their pretension to exercise the powers of the English Parliament if only they had really held a corresponding position in the country. He declined to place a set of country lawyers and professors on a level with the great proprietors and with the recognized statesmen of England. Although his frankness may have been neither courteous nor politic, his judgment was, as usual, sound. The English House of Commons has, on the whole, notwithstanding successive extensions of the suffrage, continued to consist of the conservative sections of society and to include the ablest statesmen of the day. Its members have on the average been richer, as they have become less exclusively aristocratic; and happily, in spite of agitation, there are as yet no working-men in the House of Commons, and only two professed representatives of the working class. The Ballot has unexpectedly at the last election diminished the influence of demagogues. The feeling of the community is still so much opposed to revolutionary measures that the last Government was driven from office because its chief was with good reason suspected of indifference to the maintenance of the great institutions of the country. The shallow theorists who affect or feel sympathy with democratic movements in Spain, in France, or in Denmark, would for the most part deprecate agitation in England for similar objects. The English Constitution works tolerably well in consequence of the operation of causes which are popularly defined as anomalies, or as instances of the illogical temperament of the nation. In real life, as in physical nature, there are neither inconsistencies nor interruptions of the necessary sequence of cause and effect. The English Constitution is founded, not on prattling rhetoric, but on the result of circumstances and on long experience, which might, if it were examined, be verified by logical deduction. It is not the fault of less fortunate communities that they have been compelled to trust to chance for the practical operation of constitutions previously manufactured. The government of a numerical majority, when it has been formally and recently established, can scarcely be corrected by the fictions and evasions which in a more historical polity tend to mitigate its mischievous tendencies. The King, the Ministers, and the upper classes in Denmark have to reconcile, if possible, with the welfare of the nation crude institutions which are yet hardly half a century old. It will not be surprising if they fail in their patriotic efforts; and the issue of the struggle will probably not be determined by the interpretation of any written document.

FRANCE.

THE election for the department of Calvados is the most remarkable and significant of any that have taken place recently. It is not only that a Bonapartist has been elected. The new deputy was for a long time Prefect of the department under the Empire, and acquired considerable influence and popularity in the district; and it might seem as if his success was rather a personal than a party one. But the history of the votes given on this occasion, and of those given in the same department on previous occasions since the fall of the Empire, shows that much more is involved than the triumph of a popular ex-Prefect. Of the eight members returned when the present Assembly was first constituted, five were Monarchists and three moderate Republicans, and at that election a very large proportion of the constituency voted. In 1872 there was an election for a single vacancy, and a moderate Republican was returned, but a much smaller number of voters took part in the election. There were three defeated candidates,

who were respectively a Legitimist, an Orleanist, and a Bonapartist, the last only polling 3,000 votes. Now a Bonapartist has been returned with 40,000 votes given for him, defeating a Republican candidate with 27,000 votes, and a Legitimist with 9,000. It is impossible to ascribe this rise from 3,000 to 40,000 votes given in favour of the Bonapartist candidate to personal merits or attractions. The department of Calvados has returned a Bonapartist because it likes a Bonapartist better than a candidate of any other shade of political opinion. Nor is it difficult to see where his votes have come from. The Orleanists and many of the Legitimists have gone over to him. They despair for themselves, and, as they have to choose between the Empire and the Republic, they choose the Empire. They find more that suits them in an Imperial Court and in a Government that governs than in such liberty as a Republic has to offer them. They want peace, quiet, and prosperity. They are very tired of the wrangles and impotency of the Assembly. They see little in the press to make them care much for its liberty being preserved. They do not understand how a Conservative Republic is to be kept Conservative. Not that such people are burning for an Imperial restoration, or care much whether the EMPEROR and the PRINCE IMPERIAL come back one year or another. They are not Bonapartists or Imperialists; they are simply thriving, prudent people, who want a strong, settled Government, and do not want to be kept for ever in a state of suspense. They quite approve of Marshal MACMAHON being at the head of affairs so long as may be possible or may suit him, and the successful candidate in Calvados had to pledge himself to support the Septennate in order to win the votes of those who did not belong to the Bonapartist party. If it could be always vacation time, and Marshal MACMAHON could be always making pleasant tours about the country, every voter of this stamp would be perfectly satisfied. But they know that the time must come when the MARSHAL'S vacation and holiday tours will be over, and, as they are asked what they think they would like to come next, they have gradually arrived at the conclusion that, among all the bad things which are offered them, the Empire is perhaps the least bad.

The history of the Orleanists since the fall of LOUIS PHILIPPE has been a very curious one. They were the only people of whom the late EMPEROR was really afraid; for they alone had to offer France a family of Princes of conspicuous personal merits and ability. Their leaders were men of great historical eminence. The party generally had wealth, respectability, and education. They kept running their thorns of criticism and protest into the EMPEROR'S side, and the EMPEROR acknowledged that these thorns hurt him. At last the Empire fell, and it seemed possible that a BOURBON might again reign in France. The Orleanists decided that they would consolidate the Monarchical party by a fusion with the Legitimists rather than play the bolder game of setting up a King of their own. There was much to be said for this. Unless a BOURBON Monarchy was supported by the great bulk of the aristocracy and men of social eminence, it would have little to lean on, and it is always painful and generally dangerous to obtrude family dissensions on public notice. As they consented to come back as subordinate members of the family of the Count of CHAMFORD, the ORLEANS Princes kept themselves in comparative retirement. They never spoke and seldom voted in the Assembly, but on great occasions their votes were at the command of the Monarchical leaders. As they thus occupied almost a private station, they thought themselves entitled to reap the advantages as well as the disadvantages of their position; and the Assembly passed a law by which what remained unsold of their forfeited estates was restored to them. In seeking this they sought nothing but simple justice, just as in taking no prominent political part they were merely carrying out honourably the bargain they had made with the Legitimists. But there can be no doubt that both their retirement from political life and the restoration of their estates have lowered the esteem in which they are held. They were able men and of royal birth; but, when compared with the EMPEROR, they had the defect of not seeming even willing to pretend to govern; and while the EMPEROR lived his last days and died in poverty, the ORLEANS Princes had, however honestly, come into large additional revenues through the war which cost humble Frenchmen so much hard-earned cash. The leaders of the party had the courage to stick to their principles, and to keep the Count of CHAMFORD off the throne,

rather than submit to a monarch who threw dirt on everything that the sons of LOUIS PHILIPPE had been taught or accustomed to honour. They were the chief authors of the Septennate, and, as they were obliged to wait anyhow, for their King cannot be King while his cousin lives, they naturally wished every one to wait too. But, although the Government owes much to them, and although they have considerable influence personally in the Assembly, they have gradually seen their power diminishing even at Versailles; while in the country it is now shown that those who were inclined to hope and wait with them think further waiting useless, and a Bonapartist is elected without there being even an Orleanist candidate to oppose him in a department which boasts that it contains the home of M. GUIZOT.

When M. GAMBETTA was at Auxerre a short time ago he announced for the benefit of his Republican friends a truth the force of which is made more obvious every day. The Republic, he said, cannot be constituted so as to last unless it gains the support of the Orleanists. He did not mention the Orleanists, but he described the class of men he wished to win over, and, if the term Orleanist is used in a broad sense, it was the Orleanists whom he described. The Republic, if it is not to be the mere triumph of a party totally unfit to govern, must be a Conservative Republic: and to be a Conservative Republic it must be supported by known Conservatives, men who command general respect and who are certain to keep as far aloof from the Commune as any one in France. M. THIERS fell because men of this stamp would not join him in setting up a Conservative Republic, and he told them, what was indisputably true, that in upsetting him they were paving the way for the Empire. Whether the more Liberal leaders of the Right Centre could now do what a short time ago they could have done easily, and keep the Imperialists in the background by openly aiding in the establishment of a moderate Republic, or whether the time is gone by and they have missed the opportunity once for all, is uncertain. It would be very rash to conclude from the Calvados election that a serious effort to establish such a Republic would fail. The candidate who called himself a Moderate Republican was defeated by a decisive majority; but then a Moderate Republican is, under present circumstances, a person who has no chance of setting up a Moderate Republic. The result might have been very different if the Orleanists, whose votes carried the Bonapartist candidate, had been invited to support their acknowledged leaders in setting up a Government that had a promising future before it. That the Empire will be restored as soon as Marshal MACMAHON drops, or can be gently got out of the way, is as certain as anything can be in French politics, unless the Right Centre, or a considerable part of it, pronounces for the Republic when the Assembly resumes its sittings. The real doubt is whether, if the Orleanist leaders had to choose, they would prefer a Republic in which they were prominent to the Empire. They have much to sway them both in one direction and the other. On the one hand, their political principles are really identical with those of moderate Republicans, and it must be a bitter thought to them that, unless they now take a decisive stand against the Empire, their Princes will be once more sent out of the country. On the other hand, all social influences tempt them to acquiesce in the restoration of the Empire. The Legitimists will have no very serious complaints to make against them if both parties have shared an equal defeat and are equally extinguished by a Bonapartist restoration. But if, through what Legitimists would call the treason of the Orleanists, anything so hateful to Legitimists as a Republic were established, there would be endless feuds in families and in social circles, and the more eminent Orleanists, though conspicuous and prospering in public, might be very far from happy or prosperous in private life.

CANADA AND THE RECIPROCITY TREATY.

THE fate of the negotiation for a Reciprocity Treaty between Canada and the United States has perhaps been already indicated by the adjournment of the American Senate before it had expressed any opinion on the subject. Mr. FISH seems for some unknown reason to have deviated from the regular course of business by sending the draft of the Treaty to the Senate for consideration before it had been approved by the PRESIDENT. According to his own statement, the SECRETARY of STATE, having himself agreed to the draft, proposed to elicit from the Senate an opinion

whether it would be desirable to sign the Treaty. It was not the duty of the English Commissioners to make any comment on the relations between the President and the Senate, although they may probably have suspected that Mr. Fish's deviation from the ordinary practice indicated little enthusiasm for the conclusion of the Treaty. The result of the negotiation will be regarded in England with entire indifference, except so far as it may affect the interests and wishes of Canada. The conclusion of an equitable arrangement on any subject with the United States would excite reasonable surprise. The Correspondence which has been presented to Parliament fully explains the origin and progress of the negotiation. The Canadian Government some time since instructed Mr. GEORGE BROWN, a Senator of the Dominion, to proceed to Washington for the purpose of ascertaining whether the principal statesmen of the United States were disposed to enter into a new Commercial Treaty. The immediate object of the inquiry was to find a substitute for the mode of settlement of the Fishery claims which had been provided in the unfortunate Treaty of Washington. By the terms of that ill-omened instrument the money payment to be made by the American Government was to be settled by arbitration; and the Canadian Government foresaw that either their own country would be annoyed or the Americans would be disappointed and angry. They consequently wished to merge the question of compensation for the fisheries in a more comprehensive arrangement, and at the same time to renew the facilities of intercourse which were abruptly terminated when the United States denounced the Reciprocity Treaty in 1866. The policy of the Canadian Government was prudent and sagacious, and the agent whom they had employed returned to Ottawa with encouraging assurances. The Ministers then proceeded to request the Imperial Government, through the GOVERNOR-GENERAL, to authorize the English Minister at Washington to enter into negotiations for a Treaty with the Government of the United States. Lord CARNARVON and Lord DUFFERIN assented as a matter of course to the proposal, and Mr. BROWN was associated as plenipotentiary with Sir EDWARD THORNTON. The Commissioners commenced their labours by drawing up for presentation to Mr. Fish an elaborate Memorandum on the commercial relations, present and past, of the British North American provinces with the United States.

The statements and arguments of the Memorandum may perhaps not be less persuasive because they are largely founded on an economical fallacy which still prevails on the continent of America, though it has for several generations become obsolete among political economists. The Commissioners think that they have proved that the traffic of which they record the history has been extremely valuable to both countries, but that the United States have from first to last reaped the largest advantage from it. In other words, Sir EDWARD THORNTON and his colleague believe in the so-called Mercantile theory which teaches that trade is a gain to the seller and a loss to the buyer. It is strange that an absurdity which was exposed by ADAM SMITH a hundred years ago should reproduce itself in an English State paper of the present day. It might have been expected that Lord DUFFERIN would call the attention of the plenipotentiaries to a blunder which pervades the whole of their Memorandum; but perhaps it may have become a rule at the Foreign Office to abstain from all interference with the relations between Canada and the United States. The Commissioners prove by statistical tables that at all times the so-called balance of trade was in favour of the United States, and more especially that during the sixteen years' duration of the Reciprocity Treaty there was "a gross cash balance in favour of the United States of 20,454,520 dollars. But the balance was in fact much larger than this. During the first ten years of the Treaty the transactions between the countries showed a clear balance in favour of the United States of 62,013,545 dollars." It is lamentable to reflect that Canada should have incurred a loss of 12,000,000*l.* by a freedom of intercourse which the Commissioners who report the disastrous news are unaccountably endeavouring to restore. In the transactions of private life Sir EDWARD THORNTON and Mr. BROWN would probably not think that a man was necessarily a loser because he bought a commodity which he required for its price in the market. The articles which were represented by the large balance against Canada must have been worth something to their purchasers. The real advantage of reciprocity to both countries was proportionate to the interchange of commodities which amounted to more than

10,000,000*l.* a year; but perhaps it may be proper in addressing American Protectionists to use their own language, as in conversation with children. The delusion that exports are exclusively profitable is perhaps inveterate, and the Government of the United States may be disposed to listen favourably to diplomatists who in economic knowledge are not in advance of their own countrymen. It is not uninteresting to learn that during the continuance of the Reciprocity Treaty the exports of the United States to Canada exceeded those which were taken "by China, Brazil, Hayti, Russia, and her possessions, Venezuela, Austria, the Argentine Republic, Denmark and her possessions, Turkey, Portugal and her possessions, the Sandwich Islands, the Central American States, and Japan, all put together." Without following the same whimsical order of enumeration, it may be worth while to quote the statement that England and her colonies take 67 per cent. of the exports of the United States, leaving 33 per cent. for the rest of the world. The fact that Austria, Venezuela, Japan, and the other countries in the list receive a cash balance from the United States is wholly immaterial.

On the abolition of the Reciprocity Treaty, Canadian industry was stimulated to seek new outlets. The federation of the Provinces was accomplished in fifteen months; the inland water communication was greatly improved; and "the great ship-building and fishery interests received a new and vigorous impetus." The total imports and exports of the Dominion and Newfoundland amount to 48,000,000*l.* a year; and it may be doubted whether any other country with a population of only 4,000,000 enjoys equal commercial prosperity. The commerce with the United States formed in the last year of the Reciprocity Treaty 52½ per cent. of the whole. It now amounts to 35 per cent. Recurring to their favourite delusion, the Commissioners add that, whereas the cash balance in favour of the United States had amounted between 1820 and 1826 to 39,000,000*l.*, the total balance against the United States in the last seven years amounts to 10,000,000*l.* Notwithstanding all the impediments to trade which result from perverse American legislation, Canada is, after the remainder of the British Empire and Germany, the largest customer of the United States; and, again, it is stated that the balance of trade, though adverse, is less unfavourable in dealing with Canada than in the exchanges with twenty other countries which are enumerated. Of the whole imports from Canada less than 1,000,000*l.* were admitted free of duty; while 6,000,000*l.* were subjected to an average duty of 25 per cent. Of the importations from the twenty countries, about three-fourths were admitted free of duty. The Commissioners disclaim any desire to criticize the manner in which the United States think fit to regulate their duties. Their statements are only intended to show the comparatively disadvantageous position occupied by Canada, as a reason for proposing the establishment of more equitable relations. Probably no argument which could be devised would weigh less with American politicians; but some of them may be influenced by the irrelevant statements about the balance of trade. Lord DUFFERIN'S statement that a one-sided treaty was impossible appears to have commanded the assent of a meeting which he addressed at Chicago; but the merchants of a great corn-mart and freshwater port have no interests opposed to freedom of trade, and Chicago would perhaps profit more largely than any other place in the United States by the free use of the Canadian canals. The domination of the manufacturers who have controlled the commercial legislation of the United States from 1861 to the present time is not yet overthrown.

At this point of their exposition the plenipotentiaries apparently began to think that they had proved too much. American economists are profoundly convinced that the gain of one party in commercial intercourse must be a loss to the other; and they may naturally inquire why, having prospered so well since the repeal of the Reciprocity Treaty, Canada should now seek its restoration. The answer is sufficient, though perhaps it may not be altogether consistent with some parts of the Memorandum. "The population of the United States is 40,000,000, and that of the Dominion is but 4,000,000. The boundary between them is for the most part a surveyor's line, often unknown even to those who live beside it; and it is of the utmost importance to Canada that common interests and mutual good will should exist between the countries. Good as their present markets are, they would gladly have the old one in addition." If there were a question of establishing free intercourse

for the first time between the borough of Finsbury and the City of London, the general reasons suggested by the Commissioners would perhaps be deemed conclusive. For once they forget the balance of trade, and assume that an aggregate of mutually profitable bargains can scarcely constitute a collective loss. They finally propose that a long list of classified articles shall be freely admitted into both countries, that the citizens of the United States shall enjoy equal rights in the Canadian coast fisheries, and that the canals on either side the border shall be opened on equal terms to the commerce of both countries. In one passage of the Memorandum the Commissioners state that articles imported free of duty from the United States must be admitted on the same terms from Great Britain. Unless equality of treatment is secured, English commerce will be injuriously affected by the conclusion of the Treaty; and, on the other hand, American monopolists will apprehend the competition of English goods which may perhaps be disguised as Canadian products. It is on the whole the policy of England to allow to Canada almost entire commercial independence. The proposed Treaty would evidently be advantageous both to the Dominion and to the United States; and it is not desirable that the Imperial Government should interpose selfish objections. The present prospects of an early settlement are not favourable; but in some of the States the Democrats find it expedient to advocate free trade and the renewal of specie payments. The doctrines of political parties in America approximately correspond with the supposed opinions of the majority, and with the decline of the Republican party a more rational economic policy may perhaps become popular.

EDUCATION IN JAPAN.

AMONG the Reports of Secretaries of Legation lately presented to Parliament is one of great interest from Mr. WATSON on Education in Japan. The extraordinary movement which in a few years has revolutionized Japan and made it a new country, with new aspirations, new ideas, and new powers, has among other things shown itself in a growing thirst for education after the pattern of European nations. Previously the Japanese had busied themselves with a sort of education, for they were naturally far too quick and ingenious a race not to see in some dim way that knowledge is power. But unfortunately, under the guidance of Chinese teachers, they had devoted their energies to cultivating verbal memory; and a young man was the idol of his family and the pride of his friends when he knew 10,000 hieroglyphics by sound and sight without attaching any meaning whatever to any one of them. Now they are almost more European in their views of education than Europeans themselves. They have had the advantage of starting fresh, and have adopted the most improved systems, the newest books, the latest appliances for conducting and interesting classes. As the United States equally with England are a great power in Japan, English teaching and English books hold the pre-eminence. But Japan borrows of every one, and French, German, Russian, and even Dutch are learnt, or can be learnt by those who wish it. It is scarcely necessary to say that the main impetus comes from the Government, and that as yet it is only in those circles where the influence of the Government is most felt, and in a few large towns, that education has really begun. But the Government is determined that, if possible, the system of education shall grow until the body of the people are fairly educated, and that those who belong to the higher classes shall have an education of which no European need be ashamed. Physical science, mathematics, a thorough knowledge of the Japanese language, some knowledge of one, or perhaps two, European languages, and a creditable acquaintance with moral philosophy and the code of moral duties, are to occupy the mind or form the aim of an educated Japanese. Girls as well as boys are to receive the benefits of the system, and a series of schools, ascending from those where the rudiments are taught to those where the highest subjects are studied, has been, or will be, established. Nor is poverty to be any bar to the studious. Those who wish to pursue the higher studies, but have not the means to do so, may live and learn at the expense of the State; but they have to undertake, and to procure some friend to guarantee their undertaking, that they will either repay the State or spend a fixed length of time in the service of the Government; and obviously it will be in the

capacity of teachers that the State will for many years principally employ them.

About two years ago a law was promulgated by which the Imperial Government decreed that 53,760 schools should be established in Japan, all under the control of a central Board of Education. The whole country was to be divided into seven circuits, with the capital as an eighth, and in each circuit there was to be a High school. Then, again, each circuit was to be divided into thirty-two districts, and in each district there was to be a Middle school; and each Middle school district was to be divided into 210 subordinate districts, with a Primary school in each. This great scheme was only intended to be a sketch or programme of what with time and patience it was hoped to realize; and of course little has as yet been done to realize it. But, in one way or another, there were at the end of last year about half-a-million of persons receiving education in Government schools, and this seems a very good beginning. But the Government is well aware that it is one thing to set up schools, and another to get scholars to go to them. There is accordingly a provision by which the catastrophe of schools standing empty and teachers idle will, it is hoped, be averted. There are to be inspectors appointed in each middle school district, to each of whom twenty or thirty primary schools will be assigned. It will be their special duty to encourage the inhabitants of the district to go to school. They will also do the business part of education, will attend to the buildings and the expenses, and will confer together, and, generally speaking, exert themselves to facilitate the progress of learning; and Lord LYTTELTON will be surprised to hear that the Imperial decree specially provides that "persons shall be chosen for inspectors who are popular with the inhabitants of the district." The troubles of the 25th Clause seem to have no parallel in Japan. Education is to be entirely secular in so far as is consistent with the fundamental tenets of the Shinto faith, and the Shinto faith does not appear likely to cause much difficulty. Proselytizing is, however, to be discouraged so far as it might be conducted through the education which the Government provides; and this is very wise, as our Indian experience has shown; although, as no Christian minister will henceforth be employed in Government schools, the services of several devoted and able men who have begun the work of education in Japan will now be lost to the Government service. Private schools, however, are to be encouraged and recognized, and in these the missionary may teach what he pleases. Further, the Government, at the same time that it decreed the establishment of schools all over the country, published an elaborate programme of what it desired to see taught in the schools of the three classes. It was meant as a standard up to which teachers were to try to work, not as one which there was any prospect of seeing introduced very widely at first. In the primary school, which pupils of ages from six to thirteen are to attend, the children are to study five hours a day for six months, with every fifth day as a holiday. It is scarcely necessary to say that the three R's are to occupy most of their time, arithmetic being taught after the European method of calculation. But even the younger boys are to learn something besides, especially geography and a little natural philosophy, while one hour every week is to be devoted to "explanations of the passions," and two to oral lectures on the means of preserving health; and boys who are somewhat advanced are to be made acquainted with the forms of letters and agreements common in everyday use. At present the little boys who are to possess this knowledge are imaginary beings, but, if they ever appear in flesh and blood, it is very possible that their distant little English brethren might have something to envy in the instruction they will have received.

There were a year ago seventy-two foreign instructors employed by the Education Department, which has an American Professor as its professional adviser; and Russian, Chinese, French, English, and German are taught in the higher schools, though not perhaps all in any one. In what proportion European languages are learnt may be gathered from an example given by Mr. WATSON of a middle school where accommodation is provided for 130 pupils learning French, 170 learning German, and 300 learning English. There are 150 young Japanese who are students of medical science, 220 studying special subjects and 300 pursuing their studies abroad, all or almost all, of whom will in time pass into the service of the State in return for the

money spent on their education; and there are already 1,100 young men who are in Government employ after having completed their course of instruction in Japan or abroad. Outside the sphere of the Education Department the services of foreigners have also been freely and impartially employed. The principal school of medicine and surgery at Yedo is under the care of Germans, the whole teaching being conducted by German professors, without any interference on the part of the authorities; while at the Government hospital in Nagasaki there are 41 students studying medicine under the supervision of two Dutch doctors, and a Prussian has been engaged to teach these students Dutch and Latin. The Naval College and a college for marine cadets are superintended by English officers, while the education and instruction of officers for the Army and the construction of docks have been entrusted to Frenchmen; and a College of Engineers to supply the wants of the department of Public Works is to be established under English management. The services of Americans are principally engaged for the superintendence of large schools; and most of the works used in schools are translations from the publications of English and American writers. Great pains have also been taken to teach the native teachers, of whom, when the system is fully developed, there will be 50,000. Normal schools have been established for this express purpose, and the first thing which those attending them are taught is, how classes are conducted in a foreign, which apparently in practice means an American school. They are also shown how discipline is to be enforced, and classes taught to recite in concert; and a sufficient number of children attend for the young men to put their knowledge in practice. At all schools the children are made to adopt, more or less, European habits. They are obliged to sit while they learn or eat, instead of squatting on the floor. No change has been made in the costume of girls, but in many of the higher schools the boys are made to wear a uniform; and in all the higher schools food is prepared in the European manner, and the sick are treated according to the ways of European doctors. The pupils are described as on the whole very apt, quick, and desirous to learn, and they give little or no trouble. Of course there are countless difficulties to contend with. The Education Board, which knows little of its duties from practical experience, is apt to interfere, to give an order one day and revoke it the next. Some of the premises engaged by the Government have turned out very bad bargains. There is great difficulty in carrying on communication between foreign instructors and Japanese pupils, as the foreigners take a long time to learn Japanese and the native interpreters are so inefficient as to be nearly useless. For years the Japanese have been taught to shun and hate foreigners, and they cannot put off old habits in a day. But every great step in progress presents at its beginning its own special difficulties, and the step in progress which Japan has begun to take with regard to education is really astonishing. The EMPEROR and EMPRESS take the greatest personal interest in the work of education, and at present education in every form is the fashion of the day. If the fashion lasts, without a counter revolution to check it, for another quarter of a century, Japan may not improbably become one of the best educated countries on the globe.

SCOTCH AND IRISH PEERS.

THE Committee of the House of Lords which lately considered the grievances of the Scotch and Irish peers has made one recommendation which ought at once to be adopted. There can be no reason why the Crown should continue to exercise the prerogative of creating one Irish peer for three peerages which may become extinct; or why, when the number is reduced to one hundred, it should be lawful to supply every vacancy as it occurs. Sir BERNARD BURKE represented to the Committee that when the number was reduced to a hundred it would be necessary, according to the letter or spirit of the Act of Union, to prevent the number from being further reduced; but the Act merely provides that from that time a new Irish peerage may be substituted for every peerage which becomes extinct. The power of making Irish peers was retained, against the wish of the existing body, at the instance of the English Government, which had found it convenient to bestow hereditary titular dignities. It is impossible that the abandonment of the prerogative should be considered an injustice to Ireland; and the passion of recent Prime Ministers for squandering public honours

may be sufficiently gratified by making further additions to the House of Lords, and by scattering baronetcies broadcast. Mr. GLADSTONE in five years made thirty peers of the United Kingdom, and his successor has already begun to follow his example. It would be difficult to define the exact degree of merit or social and political importance which entitles a man to be more than a baronet and less than a peer of Parliament. When the Union with Scotland was effected, English Ministers had not thought of increasing their patronage by the institution of a new and anomalous dignity; nor would the Scotch peers who had formed a part of their national Parliament have approved of a degradation of their order. During the eighteenth century the privilege of sitting in the Irish House of Lords was lightly esteemed by the Englishmen who from time to time accepted Irish peerages; and for Irishmen the standard of qualification was lower than in England. GEORGE III. announces in a letter to Lord NORTH his determination to create no more Irish marquises, on the ground, amongst other reasons, of his respect for English earls. It would scarcely have occurred to the King or to his Ministers that the titles which were given as rewards for political services, sometimes of a questionable nature, would at a future time serve as a pretext for claims to seats in the Imperial Parliament. When Mr. BUTT revives an Irish House of Lords, the peers created before or after the Union will have an indisputable right, if not an inclination, to resume their legislative functions.

One disability under which Scotch peers labour must henceforth excite but little compassion. Of thirty-four who neither sit as representative peers nor as peers of the United Kingdom twenty-seven objected, in answer to a circular inquiry, to any measure which should enable them to sit in the House of Commons. The Committee nevertheless recommends the removal of the disqualification, but the Duke of Buccleugh, Lord SALTOUN, and Lord ELPHINSTONE protest against the proposal for reasons which are entitled to some weight. The prohibition has never been directly imposed, and the protesting peers contend that no permission to sit in the House of Commons could be granted to them which would not extend to all the peers of Great Britain. Before the Union Scotch peers occasionally sat in the House of Commons, as English subjects are still not rendered ineligible by the accident of their bearing foreign titles. The best known instance is that of the Lord FALKLAND who owes to the friendship of CLARENDON the preservation of his memory. The Treaty of Union provides that all peers of Scotland shall thenceforth be peers of Great Britain, with precedency immediately after the peers of like rank in England at the time of the Union, and that the Scotch peers shall enjoy all privileges of other peers of Great Britain except that of sitting in Parliament. It is only because they are peers of Great Britain that the Scotch peers are debarred from sitting in the House of Commons, and the disability notoriously depends on common or constitutional law, and not on any legislative enactment. It would of course be within the power of Parliament to enable a portion of the peers of Great Britain to become eligible for the House of Commons, but it is highly improbable that such a Bill could be carried against the wish of those who are principally concerned. No similar provision is contained in the Irish Act of Union, which expressly declares that no Irish peer shall be disqualified from serving as member for any county, city, or borough in Great Britain. The Irish peers in general receive coldly the suggestion that they should also be enabled to represent Irish constituencies. Even a disability may sometimes be accounted a distinction, especially when it can be explained on historical grounds. At the time of the Union it would have been inconvenient to disqualify the Irish peers who then sat in the House of Commons, but no similar difficulty applied to Irish seats. The proper place for an Irish peer is in the House of Lords, if he can persuade his colleagues to elect him as a representative. Unluckily, it happens that, unless he professes Conservative opinions, he has no chance of becoming a representative peer. The Committee has declined to approve the suggestion of a cumulative mode of voting which might sometimes give a Liberal peer a chance. As the Scotch peers are almost unanimously Conservative, no mode of voting which could be devised would affect the character of their representation. It will be strange if the Liberalism of Irish peers long survives the Church Act, the Land Act, and the Home Rule agitation.

The process of establishing a claim to vote for a representative peer is more rationally arranged in Ireland than in Scotland. It seems that any intruder may tender his vote at Holyhead; and that it is a mere chance whether the unsoundness of his pretensions is discovered. The claimant of an Irish peerage lays his credentials before the Lord Chancellor, who in doubtful cases refers the matter to the Committee of Privileges. The Scotch Roll contains a list of peerages, and not of persons qualified to vote; and both in Scotland and in Ireland something might be done to correct other anomalies of detail. The question is whether it is worth while to cultivate strict symmetry in dealing with an institution of little political importance. Lord ELPHINSTONE, who is the principal advocate of the pretensions of Scotch peers, undertook to prove, by ingenious statistics, that their proportionate numbers had diminished since the Union. At that time there were 166 lay peers of England; and there are now 422 of the United Kingdom. If 45 of the number who are also peers of Scotland, and 80 who are peers of Ireland, are deducted, there will remain 297 as compared with 166, while the number of Scotch representative peers in 1874, as in 1707, is restricted to 16. There are only 34 Scotch peers who have not hereditary seats in the House of Lords, and therefore there are only 18 who are actually excluded. Lord ELPHINSTONE suggests that the number of representative peers ought, in proportion to the present number of peers of Great Britain, to be increased by 12, which would leave only 6 peers entirely without seats. It would follow from this argument that the small remnant might without inconvenience be absorbed, and that the representative peers should sit in the House by permanent and hereditary right. The fallacy of Lord ELPHINSTONE'S reasoning consists in his disregard of the fact that 45 out of the 297 have been selected from the ranks of the Scotch peerage. At the time of the Union only two or three Scotch peers held English peerages, so that Scotchmen formed about a ninth part of the whole body. The 61 Scotch peers who sit either as representatives or by hereditary right now form between a fifth and sixth part of the whole number of peers of Great Britain. Lord ROSEBURY reminded Lord ELPHINSTONE that during the present century 39 Scotch peerages have been absorbed. The continuance of the same process would dispose of the remainder within a reasonable time.

The 18 respectable gentlemen who have no seats in the House of Lords, and who have no wish to sit in the House of Commons, are partially consoled by social rank and precedence; and their sorrows are borne by their neighbours, if not by themselves, with fortitude. Three or four of the number seem to have no political opinions whatever, and nearly all the rest have the satisfaction of agreeing with the majority of the House of Lords. The Irish peers, though they are more numerous, have the advantage of being eligible to the House of Commons. They have lost little by the deprivation of the privilege enjoyed by the ancestors of those whose peerages date before the Union. The Irish House of Lords was not a venerable or illustrious assembly even during the eighteen years of independence which form the golden age of discontented Irish patriots. It is obviously out of the question to admit the whole body to the House of Lords, and the proposal of the Select Committee that four additional representative peers shall take the place of the disestablished Bishops hardly deserves consideration. When Mr. BUTT'S Irish Parliament is reconstituted, the Roman Catholic Bishops will probably demand the seats which were held by the prelates in early times. The House of Lords will best show its wisdom by discountenancing any change in its existing constitution. It is not desirable to examine, with reference to expediency, rights and privileges which have their origin in custom, or to weaken the argument in favour of an hereditary assembly which is founded on the proved difficulty of providing a substitute. Life peerages and absorbed Scotch or Irish peerages are but patches on an old garment which is not even in need of mending. Mr. BRIGHT, when he was a Minister, talked with characteristic courtesy about tinkering the House of Lords; but a hint may be taken from an enemy, though it is rudely expressed. The half-dozen Civil Knights of the Bath who would like to be life peers, the 18 Scotchmen and the 70 or 80 Irishmen who are peers, but not peers of Parliament, must be content to suffer for the good of the community.

NEW LIBERAL CLUBS.

AT the present moment the Liberal party would appear to be engaged on a curious experiment, the results of which may perhaps throw some light on the processes of political development. There can be no doubt that the party has been severely shaken by recent disasters, but there can of course be equally little doubt that at some future time it will renew its strength, and once more exercise a predominant influence on the course of public affairs. The only question is, how long it will be before this time arrives, and whether the Liberals themselves can do anything to hasten its advent. Just now their party is in pieces; can it, by taking thought, put itself together again, and make itself, by its own effort, large and strong? This is the problem which has to be solved, and it will be interesting to watch the result. It has been authoritatively announced that a vigorous effort at reorganization is about to be made, and that no means of accomplishing this object are to be left untried. All the latest appliances and improvements in the art of organizing a party are to be introduced, and the leaders of the movement are quite willing to take a lesson from the ingenuity of their opponents. The Liberals, we are told, have meditated seriously on the events of the last election, and think that they have discovered the reason why the Conservatives were so successful. It was, it is supposed, because they had so many nice clubs; and the Liberals are now determined to have as many and as attractive clubs as their rivals. In London there is to be a grand new club in the City for men of business, and there is to be another at the West End, and various minor clubs are to be set up in different parts of the country. It is expected that in this way not only will the existing Liberals be brought together, but other people will also be tempted to embrace Liberalism in order to enjoy the advantages of these delightful establishments, and that the members of all these clubs will be bound together by social intercourse of the most brotherly and loving kind, and will all work together with the most perfect harmony and devotion for the good of the party. It would appear that the Liberals have become quite cheerful in the contemplation of this agreeable prospect, and there is certainly no reason why they should not have as many clubs as they choose. It is true that this view of the tastes and functions of a great party is somewhat of a descent from the heroic elevation of a few years ago, when the stimulus of sublime principles was thought to be sufficient; but it is perhaps not unnatural that people who have not succeeded in flying should be disposed to make the best of a more vulgar style of locomotion. The plan of attracting customers by the offer of refreshments has before now been heard of in the competition of rival shopkeepers, and has indeed been improved upon by the ingenious Mr. COLE at the South Kensington Museum, where all visitors to the bar and grill-room are duly scored at the wicket as votaries of art. Mr. STANSFELD once laid down the principle that the existence of the Liberal party was an object in itself, and that the choice of measures was only a means to that end. The provision of social accommodation, if it will serve the purpose, may be gratefully accepted in preference to periodical revolution. The Liberal party will henceforth appeal for support on the ground, not only of blazing principles, but of choice cookery and well-ventilated billiard-rooms; and its programme of policy will assume the form of a bill of fare.

The number of clubs in London is rapidly increasing, and, from the advertisements of new ones which are constantly appearing, it may be doubted whether this form of enterprise really needs to be taken in hand by the noblemen and gentlemen who lead an important political party. It would seem as if there were already clubs for everybody who wanted them, and plenty of speculative wine-merchants anxious to supply any additional accommodation of this kind that may be required. The question, however, is whether the new clubs are likely to strengthen the political vitality of the party which is starting them under the most distinguished patronage. In some degree the Conservatives may possibly have derived advantage from meeting together in clubs, but it is easy to exaggerate the importance of this agency, and it does not at all follow that the Liberals will find it equally serviceable. The Reform Club has been in no want of members, but it is doubtful if in recent years it has tended materially to promote the cohesion of the party,

or to impart force to its operations. It is not in accordance with familiar experience that men are invariably led into more affectionate relations by being brought together in an intimate manner. The personal qualities which are usually found in connexion with a Conservative turn of mind are naturally favourable to peaceful and pleasant association, while they at the same time tend to assist the discipline of the party. The main reason why the Liberals recently suffered a collapse was no doubt that they had fallen away from the spirit and temper of the bulk of their countrymen, but personal causes might also be discovered for their internal disintegration. As social equality advances, any sort of distinction that will mark a man off from the rank of his neighbours is more eagerly sought after; and political agitation offers a tempting escape from obscurity to many persons of the class from which the Liberal ranks are chiefly recruited. It has been observed that on this side of the House of Commons members are apt to accept the general guidance of a leader only on condition that on certain questions they shall be allowed to come to the front themselves, and that an inconvenient ingenuity has been displayed in inventing or discovering questions suitable for this purpose. It has been said that the Liberals are necessarily more exposed to internal dissensions than the Conservatives, because they think for themselves and consequently vary in their conclusions. It might be more correct to say that the Liberals are more prone than their opponents to take up personal points of view, and to indulge the desire for personal distinction or notoriety. The Conservatives, if more sluggish, are at least more patient and adhesive, and these characteristics are probably displayed in private as well as in public life. The independent activity of mind which some of the Liberals complacently claim for themselves is not greatly conducive to social harmony, and it is quite conceivable that persons of this class might not love each other more from meeting each other constantly. The disposition of the majority of the members of a club is towards ease and quiet, which are likely to be disturbed by the restlessness of violent reformers. There is no reason why the experiences of the Reform Club should not be repeated in a new building with another name. A club which is intended for the purposes of political agitation ceases to be a club in the ordinary social sense and becomes a mere committee-room. Some great men, like great mountains, are more impressive when under a cloud, and there is a whimsical absurdity in fancying that a Liberal neophyte will be fired to enthusiasm for his political creed by having the opportunity of seeing his leader eating a mutton-chop or playing billiards.

It is probable that the new Liberal clubs will have no difficulty in obtaining members, but it may be reasonably doubted whether they will answer the special objects of their promoters. It is necessary, no doubt, that a party should not only have a policy, but should be in working order, so as to be able to give effect to its principles, and clubs and other associations have their uses in this way. They are part of the apparatus with which a party works, but the apparatus is of little value except in the hands of people who have a distinct purpose and settled plans. The misfortune from which the Liberals are at present suffering is that they are not agreed upon any definite aims. Their stock-in-trade of practicable proposals is exhausted, and some time must elapse before new questions reach the point of growth at which they can be utilised for political purposes. The Liberal party, in fact, shares, in spite of itself, to a large extent the general mood of the nation. It would like to do something in order to show that it exists; but there is just now nothing for it to do except to watch the Government, and to supply the negative criticism which stops short at objections and proposes nothing as an alternative. It has not only to make up its own mind as to what had better be attempted, but, when that stage has been attained, it will further have to apply itself to bring round the general opinion of the country to its views. If the agreement which is now wanted could be supplied, the clubs would be quickened by the new life of the party; but it is reversing the natural order of things to imagine that the clubs will produce that harmony the existence of which is an indispensable preliminary to their own success. The truth would seem to be that it is extremely little that any political party can do directly to bring about the condition of affairs in which it is likely to be uppermost. It can

only watch its opportunities, and in a slow quiet way contribute to the formation of opinion. It must wait for the tide which will come only at its own time.

PROFESSOR TYNDALL'S ADDRESS.

THE address of the President of the British Association is always looked forward to with great interest as well by the literary as by the scientific part of the community. The somewhat popular constitution of the Association controls the selection of President so far as to prevent the choice of a dry specialist, however high his reputation may stand—an advantage, however, which is not much felt at the present day, when we have few eminent specialists who do not possess sufficient breadth of knowledge and interest to enable them to fill the position satisfactorily. Hence the President is generally a man well known to the public, and, as there is a tacit understanding that his address should not be too technical, the result is that we have the pleasure of hearing a statement of the achievements and prospects of science, or of some special branch of it, made by a man fully qualified to speak with authority, and with every imaginable stimulus to acquit himself as well as possible on account of the publicity of the occasion and the honour that has been done to him by his selection for the post. And there is a particular interest in the occasion when the President is a man who has not escaped taking a share in the public controversies of the day. Prevented by his position from appearing as the partisan, and yet not expected to sink his own personality so far as to avoid the subjects with which his name is connected and through which he is best known to his audience, he has the task of combining the aims of an advocate with something of the formal impartiality of a judge. In selecting Professor Tyndall for the post the Committee must have felt that they were choosing a man who was specially qualified for it. There could be no fear that he would fail in maintaining his individuality, and, on the other hand, so practised and popular a speaker might well be trusted to avoid giving offence. He has more than once, it is true, incurred great odium by the outspoken way in which he has declared his opinions, and he has been pronounced rash for so doing; but it has required only a few years to see that he had calculated better than his adversaries the amount of popular support that his views would presently obtain. His acquaintance with Germany has probably taught him that honest impatience of any concealment of opinion which is so characteristic of the country which was obliged to content itself with intellectual freedom until the fortune of war led to its becoming politically free; but he has not lost the caution of his native land. There was just as little doubt that his address would be a success when delivered as there was that it would provoke keen controversy afterwards.

In neither respect has his address disappointed expectations. It is somewhat premature to speak of the controversy it will excite, but both the subject and the treatment were such as to render it all too certain that controversy will follow. We confess that we were surprised that the President so wholly abandoned himself to elaborating one idea, and that one so distasteful to a large portion of those interested in science—the idea of the utterly mechanical nature of the universe, animate and inanimate alike. That he would touch on the so-called points at issue between science and religion was to be anticipated, but we expected that past experience would have taught him to content himself with incidental references to them, without taking one for his text. But he has shown himself to be one of those eager champions of science whose zeal will not permit them to allow science to colonize quietly district after district over which of old theology exercised a nominal sway, but who insist on the formal cession of the whole. Such champions are responsible for most of the ill-feeling between the members of the two schools of thought, if we may call them so. There would be little opposition if those parts of the universe only with which science could deal were formally claimed. No doubt theology thought it a usurpation when she was dictated to on the subject of the structure of the solar system. But she soon found that her own ideas were very vague and scant on the subject, and rested on no basis whatever, while the rival ones were clear in detail, and rested on indefeasible evidence. So she gave up with a tolerably good grace, and subsequently showed that she had so far profited by the lesson as to repeat the process with much greater grace when geology and other sciences came to take from her other portions of the unknown, which she had supposed to be beyond the reach of science and to be in her own realm. But theology still objects to make formal cession of lands which science can no more cultivate than she can, and really this tolerably harmless little peculiarity might as well be so far respected as that one should not go out of the way to provoke opposition by insisting publicly on her ceding them. Darwinianism, so far as it has been demonstrated with any degree of certainty, is as freely admitted by that part of the clergy who keep pace with the literature of the day as were the fundamentals of geology some few years ago; and when we are in a position to demonstrate the mechanical origin of life, or even to make it probable, save by a superficial generalization whose cogency varies inversely as the thoroughness of the study on which it is based, then the same people will admit the truth of this doctrine. But they have a right to demand that we shall not ante-date the possible discoveries of the future and require from them immediate belief. One of the worst effects of this course of conduct is that the

opposition which it raises renders social reformers powerless against forms of practical superstition which would long ago have vanished under the influence of growing enlightenment, had not the pioneers of that enlightenment caused it to be viewed with so much jealousy by the mentally more conservative part of the community.

It must not, however, be thought that the address was offensively polemic in tone, or even that it showed a disregard of the feelings of those who differ from the speaker on the point. A perfect conception of the tone and structure of Professor Tyndall's address may be obtained by imagining some eminently diplomatic Italian Minister of the present day—some Italian Lord (Crauville)—addressing an influential audience, partly lay and partly clerical, on the question of the temporal power of the Pope. He would point out how in the very earliest times there had been eminent men who had doubted the advisableness of such a power and who had even prophesied its dissolution; and, while sketching the progress of this idea, he would dwell on the encroachments that had actually been made on the Pope's temporal sway, and how these encroachments had subsequently been acquiesced in, and were at present so little subjects of contention that the very persons who had been instrumental in effecting them were now honoured names. All this would be done without a trace of harshness; and if he chanced to mention that the Papal States were governed at certain periods execrably, or to dwell for a moment on the happy condition of people living at the same time but under different government, he would protest against its being his intention to impute any blame to any one, and would probably go out of his way to excuse it in some ingeniously unsatisfactory manner. He would urge that, after all, the temporal kingdom claimed was very small and unimportant compared with other kingdoms; that it could not be of importance to so great a spiritual potentate whether or not he retained this little fragment of temporal sovereignty—nay, that by challenging rivalry with other temporal sovereigns his dignity was rather diminished thereby; and he would conclude with the assurance that all felt how greatly his spiritual power differed from, and in fact transcended, aught that mere earthly monarchs claimed, and that they fully felt and rejoiced at its unassailability. But throughout the whole would run a quiet consciousness, expressed rather in style and manner than in words, that while it was well to speak thus in order that all things might be done amicably and with good feeling, it was not of the slightest importance to the thing itself; for that, whether the clerical portion of his audience liked it or not, the said temporal power must go, and that speedily and irrevocably. Just such an address was that of the President on Wednesday last. He dwelt first on the crude but far-seeing guesses of such men among the ancients as Democritus, Empedocles, and Lucretius at a scientific theory of the universe, and showed how they heralded the advance that was to be made in ages long subsequent to them, whereby domain after domain of phenomena would cease to be regarded as the results of capricious and anthropomorphic powers, and would be allowed to be under the rule of fixed laws. Then he touched on the scientific stagnation of the middle ages in Christendom, and the bitter persecution to which the forerunners of our present enlightenment were exposed. But he makes admirable excuses for this conduct of the Christian Church of that day, so that we are bound to regard the fact that warm praises of the Mahomedans follow as the consequence solely of his impartiality and his adoption of a chronological arrangement. Through Copernicus, Galileo, Kepler, and Newton he passes on to Pere Gassendi; and then we arrive at one of the most characteristic parts of the whole, the digression on Bishop Butler, whom he makes hold an imaginary discussion with a follower of the Lucretian philosophy. It is needless to say that the result of this dialogue is satisfactory to all parties; that if the Lucretian is shown to be too narrow in some of his views, yet the Bishop obtains his victory by arguments which, if they are not quite such as he would have used, have the greater merits of being offensive to no one, and of pointing directly to the amicable arrangement to which the address is meant to lead up. Then Darwin and Spencer come under review. Vast as are our obligations to Mr. Darwin, and greatly as he has tended to raise the reputation of English science in the eyes of the world at large, we cannot approve of such fulsome adulation of a living man as was indulged in by Professor Tyndall in relation to him. The general principle that extravagant compliments uttered in the presence of the person to whom they refer are an impertinence applies to extravagant laudations in a public address like that of the President of the British Association, if the person be alive, even though he be not actually present to hear them. These writers carry him to the extreme point of his advance. The former supplies him both with an account of the development of the physical nature of the higher forms of life and with an explanation of the cause of that development. What Darwin has done for physiology Spencer would do for psychology, by applying to the nervous system particularly the principles which his teacher has already enunciated for the physical system generally.

Adopting the conclusions of these writers, if only as provisional and imperfect solutions, at least as so far true that they can only be supplanted by others framed on the same general lines, Professor Tyndall stands free to face with the question with which he has in reality been dealing throughout—Are we still to leave to the domain of special creation the origin of life and consciousness? And here he professes himself deserted by these his latest guides (though this is hardly fair to Mr. Spencer), and, facing the question as it were alone, he pronounces in favour of the

theory that life arose from the automatic action of matter. "Abandoning all disguise," he says, "the confession I feel bound to make before you is that I prolong the vision backwards across the boundary of the experimental evidence, and discern in that matter which we in our ignorance, and notwithstanding our professed reverence for its Creator, have hitherto covered with opprobrium, the promise and potency of every form and quality of life." The boldness of this utterance is, however, speedily toned down, though rather in form than reality. Though it is clear that the speaker would cut off religious ideas from all contact with the external world, yet religion is not to be banished from the human mind. On the contrary, he speaks of the "immoveable basis of the religious sentiment in the emotional nature of man," and is even so gracious as to intimate that it may be made useful. "The lifting of the life is the essential point, and as long as dogmatism, fanaticism, and intolerance are kept out, various modes of leverage may be employed to raise life to a higher level. Science itself not unfrequently derives motive power from an ultra-scientific source." Having thus patted religion on the back, with assurances that science does not object to it if it will kindly give up all that science wants it to give up, he proceeds to his peroration, which, whatever may be thought of its sentiment, must be credited with possessing great dignity and force. There is no concealment of the claim that he makes on behalf of science. It is true that he phrases it as a claim to the right of discussing the subjects of which he has been speaking as being within the scope of science; but the hint that at the present day the choice of "intellectual peace at the price of intellectual death" is open to us, and the reference to the "inexorable advance of man's understanding in the path of knowledge," mean much more than that phrase might be supposed to connote. It means that man's life from his birth, which is its commencement, to his death, which is its extinction, is to be a subject for science, and for science alone; and though up to this time the President had maintained a most gracious tone towards the highly modified form of religion of which he approves, yet he now cannot be prevailed to make any greater concession to it than the assurance that if the human mind, after enjoying all the happiness that science and art can give, still remains unsatisfied and persists in thinking of and trying to fashion "the mystery from which it has emerged," the speaker would affirm it to be a field for the noblest exercise of the "creative faculties."

No doubt many persons will hail with delight this outspoken demand for complete freedom to regard all knowledge as scientific as opposed to religious, and they will admire the honesty of purpose which led Professor Tyndall to choose his presidential address as the occasion of his manifesto. While we fully appreciate the honesty of the motive which led to the choice, we much doubt its wisdom. As we have before said, there is not the slightest opposition on the part of any Church or religious party to any special study. Even the Ultramontanes, though they must be sorely troubled to reconcile this part of their conduct with the Syllabus, do not dare openly to object to any department of research, and only hinder it, if at all, by supporting and assisting those who attack it by arguments and other legitimate weapons. And, this being the case, we do not see why those who are not framed for special researches, but rather for being the spokesmen of science, should bring odium upon it by trumpeting forth on occasions like these such of their beliefs as are most controverted even among themselves, and are most objected to by a large part of the outside world. It does not do much to settle the questions in dispute. Professor Tyndall confesses, as of course he must, that in deciding that the atoms possess in themselves the potentiality of forming conscious beings he goes beyond evidence, and under such circumstances he cannot claim to have established a right to be followed by others. If the step be a right one, it will be taken in due course of time by mankind in general, and the way to hasten that time is by increasing the evidence on the subject, and not by rousing opposition by confessedly premature manifestoes. The world takes a long time to digest new knowledge, but it does inevitably digest it at last. When this is done, its behaviour will be affected thereby in the right way, but you cannot antedate that time by preaching what, after all, are only possibilities, not certainties. And the occasion is one which should be sacred to science, not to polemics between science and its real or fancied foes. There is too much danger of so popular a gathering as that of the British Association becoming too dilettante in tone and doing little or nothing for the real progress of science. Nothing pleases dabbles in science better than wide generalizations, and the less rigorous the demonstration the less difficult is it to them to master. Such people will necessarily be attracted by an address like that of Professor Tyndall, but they are not desirable members of a scientific association. On the other hand, many real scientific workers will be offended by it (apart from any religious grounds), because this light and easy theorizing, which finds no difficulties in framing hypotheses or in hypothesizing the evidence necessary to justify so doing, is positively distasteful to those who are patiently demonstrating the detailed truths of science, and who know perfectly well that it is only thus that science can be permanently advanced. It is not jealousy on their part, but it arises from a fear that the applause which attends the man who is the first to make generally known a scientific guess or discovery may not only stimulate unscientific haste in conjecture, but may lead scientific men to prefer to gain renown through the discoveries of others rather than to merit it through their own. And we think that when the direct effect of

hearing the speech has passed away, there will be not a few even of the enthusiastic audience that applauded Professor Tyndall who will be of opinion that it would have been better if the address of the President of the British Association had been more strictly confined to subjects directly connected with the immediate work of scientific discovery.

AN OPENING FOR THE ARISTOCRACY.

A DISCUSSION is always going on as to the classes which are most fitted for emigration, and the places most fitted to receive them. One country invites only sturdy labourers; whilst another requires men of moderate capital. As a general rule, however, it seems to be agreed that the classes which make their living by their brains had better stay at home. Intellectual accomplishments are more highly valued in comparison with mere muscular excellence in an old than in a new country. In short, people with brains and without either money or muscles had better be content to stay in England. To this rule, however, there is evidently one exception. We are glad to discover that there is an excellent opening upon the other side of the Atlantic for a class which is perhaps not so numerous amongst ourselves as is sometimes suggested, but of which we may at least say that the supply always exceeds the demand. There are, in short, a certain number of young gentlemen of good birth and decent education who are gradually going to the dogs. We have but too frequent opportunities of witnessing some of the stages of this melancholy process. Novelists have described the successive phases of the development. We know them all, from the young gentleman who is inclined, in gentle language, to exceed his income, to the unfortunate being who has sunk to a billiard-marker, a recruit in the Zouaves, or even a crossing-sweeper or a sandwich-man. The details vary, but the general nature of the process is painfully monotonous. One provoking peculiarity of the race is its tendency to be always turning up again. One's respectable relations sometimes appear to set a very slight value upon the family tie; but it is annoying to see the tenacity with which your third cousin once removed will assert the right of his blood, if only he happens to be a thoroughbred cheat and scoundrel. It would therefore be a public benefit if some region could be discovered in which such people might receive so warm a welcome that they would not be disposed to leave it. If any of our readers (we beg pardon for so strange an hypothesis) happen to be thoroughly unprincipled, and find it increasingly difficult to work upon the benevolence of their relations, we have much pleasure in referring them to the career of the "Right Honourable Lord Gordon." It is often said after dinner that Englishmen and Americans are united by the closest of ties; and references to Shakespeare, Milton, and Cromwell are adduced to confirm the theory. There is another connexion not so generally avowed, but which is in one respect even closer. Americans at times can occasionally be more English even than the English themselves. "Our loyal passion for our temperate kings" is appreciated in America, but cannot well be exceeded; but our love of a British noble has its limits. We recognize the fact that a man who calls himself honourable may sometimes be little better than an impostor; and here, it seems, the American goes distinctly ahead of us. Love for the British aristocracy, which is of course to be commended in moderation, is pushed on the banks of the Mississippi to an excess which we can hardly approve. So warm is the devotion of those simple-minded democrats to the title of lord, that they will not even entertain the possibility of its being falsely assumed. Even the most hardened of rogues must surely shrink from committing such a profanity as to claim alliance to the British peerage without a real claim to the honour. Such, at least, is the only theory which will give a logical justification for the behaviour of the good people of Minnesota to our distinguished countryman. A gentleman, it seems, came to the principal hotel at St. Paul's in that State some three years ago, calling himself G. Gordon. He preserved an aristocratic reticence as to his true character; but it "came to be understood" that he was a nobleman of immense wealth, and that he intended to import a colony of Scotchmen from the family estate. His note-paper was stamped with a coronet; and the Minnesotans darkly whispered amongst themselves that it was the mystic symbol which in England implies an earl's dignity. Though his modesty prevented him from calling himself "lord," he accepted the designation when it was volunteered by his acquaintance. The Northern Pacific Railway Company was thrown into a fine frenzy of enthusiasm. It invited the Scotch nobleman to inspect the territory at its disposal. A party was organized with long trains of waggons, provisions, servants, and French cooks. Champagne flowed freely at every meal; and three months were consumed in a delightful trip through a most interesting country. The expense of the excursion amounted to 15,000 dollars; but it is said that the officials do not much like to talk about it. Lord Gordon returned delighted with his hosts, delighted with the country, and delighted with everything, but then somehow faded away into the dim distance. The Scotch colonists never came, and the lands were never bought.

Such a success was creditable; but Lord Gordon Harcourt Gordon—that appears to have been his full title—meant it to be a mere stepping-stone to further and still more glorious adventures. What follows, indeed, is so amazing that we find it difficult to believe in it, even on good evidence. Of all cities in the world, New York is supposed to possess the keenest speculators. Amongst

all the speculators in New York, few, it may be presumed, can be put beside those skilful gentlemen whose management of the Erie Railroad has become proverbial. Considering, too, what cruel imputations have been made upon their character by the outside world, one might suppose that, if they had any weakness, it would not be that of a too easy credulity. To take in Mr. Jay Gould is an enterprise in the annals of swindling which we can only compare to an attempt to outmanœuvre Moltke, or to impose a modern daub for a genuine Raffaele upon the Director of the National Gallery. And yet nothing less would satisfy this gallant Gordon; who, one would suppose, must have been the object of some suspicions after the performance at Minnesota. And yet he came, saw, and conquered. He trusted in the coronet upon his note-paper, as Constantine trusted in the sign of the cross; and his trust was justified. The talisman of an English peerage has indeed wonder-working powers in America. It is a loss to literature that his lordship has not survived to write his memoirs and give us full details of this most gallant of exploits. All that we are told is that he graciously accorded an interview to Mr. Jay Gould; that he represented himself as in some way empowered by the English shareholders; and that hereupon Mr. Gould placed in his hands 200,000 dollars in cash, 300,000 dollars in shares, and his resignation as President of the Erie Company, to take effect on the appointment of a successor. Besides this, Mr. Gould entrusted Lord Gordon with \$36,000, with which Gordon was to present a farm to Mr. Greeley, as a mark of favour and as an inducement to be favourably regarded by the *Tribune*. And here, alas! Lord Gordon culminated. He was suspected, forced to disgorge much of his plunder, and cruelly cast into prison. He managed, indeed, to escape for a time, but was at length arrested on the complaint of some previous victims in Edinburgh, and ended his career by blowing his brains out. He had lost his Waterloo, but had not the long-suffering of Napoleon. Who can say but, if he had been patient, he might have had another hundred days of glory, champagne, and adulation from railway companies? But no man, however great, is armed at all points. We must pity rather than condemn him too sternly. After all, whatever success might have awaited him in the future, he had probably had the most glorious triumph ever won by a swindler with so few advantages; and to have cheated even the people of Melbourne and Sydney after making the conquest of New York would have been a triumph unworthy of so great a soul.

The story, as it stands, is sufficiently instructive. Why should any disreputable young nobleman stay at home? In England he must of necessity be more or less a drug in the market; and his pretensions can be too easily subjected to a severe scrutiny. In every country town there are some people who know the peerage as well as their Bibles, and would be able to estimate the true value of his relationship to a great man. After taking in a confiding tradesman or two, and living for a few days at a grand hotel, vengeance must inevitably descend upon him. But in the Far West, where a downright cheat can obtain such startling results, what might not be effected by a man who had really some substratum of fact to support his pretensions? If the mere glimpse of a coronet on a sheet of note-paper attracts such offers, what would not be the value of genuine credentials, such as even a black sheep might easily obtain from his family? The mines which have been worked by confiding Englishmen in America have not always turned out to be a great source of wealth to their proprietors. But evidently there is a mine in the unfeigned enthusiasm of the genuine democrat for an English lord from which the most dazzling profits may be extracted by skilful management. We must fear, indeed, that Lord Gordon has rather injured the prospects of his successors. Like the Spanish conquerors of Mexico, he has left but small gleanings for those who shall come after him. Yet there must be many pickings still left in the remoter parts of the country. A man who cannot dig and is ashamed to beg may still find ample employment in the third great department of industry by which fortunes may be realized. Poor Gordon's suicide will probably tend to throw discredit on his trade, but that is only another proof that ambition may aim too high. If he had had the sense to retire at the right moment to some country where extradition treaties are not in existence, he might even now have been living like a prince, and possibly have founded a family from the plunder of Jay Gould. If our modern nobles, as indignant democrats sometimes tell us, owe their origin to piratical enterprises, why should not the nobles of the future trace their descent from the pirates in kid gloves of our days? A century or two hence, moreover, the story might be altered, and the primitive Gordon be supposed to have been a Pilgrim Father or a Revolutionary general. Meanwhile, to use the customary formula, his story will not have been written in vain if it persuades only one outcast from the English nobility to live upon the plunder of foreigners instead of being a burden on his own relations.

Finally, we must say a word for the admirable illustration thus afforded of the truth of the familiar line about the

Fears of the brave and follies of the wise.

We may now add the simplicity of the cunning. It is really pleasant to find that Mr. Jay Gould has some human weaknesses. We have been so much accustomed to look upon New York financiers as a superior order of beings that we are glad to discover that they sometimes fall into traps as well as set them; and we admit that we feel a certain glow of national pride when we think that these acutest of mortals have been taken in by an Englishman. Saratoga and Yorktown are to some extent avenged.

THE "TITLE OF REVEREND."

MEN'S minds have been of late so largely given to ecclesiastical questions that it is not wonderful that, now that the Silly Season has set in, its little showers and breezes have taken an ecclesiastical character. The letter of the Bishop of Lincoln about giving the title of "Reverend" to a Wesleyan minister came at a happy moment for the tribe who, as soon as the Session of Parliament is over, run to show off their small learning in the shape of letters to the *Times*. There can, we think, be no doubt that the Bishop was wrong. No kind of principle is involved in giving the "title of Reverend" to a Dissenting minister. The thing is so wholly indifferent that the man who held the highest notions of sacerdotal power and dignity might do it without giving up one jot of his position. We have heard of a man who was so orthodox that, whenever he passed a place of Nonconformist worship, he used to cross himself and spit. We have heard of another who, being himself the son of a Nonconformist minister, reached that pitch of zeal that he made it a matter of conscience always to direct to his father, not as "Reverend," but as "Esquire." Now we venture to think that in this last case the description of "Esquire" must have been, from any point of view, as inaccurate as "Reverend"; and even the man who crossed himself and spat, if he could have brought himself to do an act of courtesy to such a priest of Baal as he must have deemed the occupant of the tabernacle, might have done that act of courtesy without any damage to his own faith in the exclusive divine commission of duly ordained bishops, priests, and deacons. We can understand a Roman Catholic refusing to give the name of Bishop to an Anglican prelate whom he does not hold to have been validly consecrated; we can understand an Anglican refusing to give the title of Bishop of Beverley or Birmingham to one whom, though he holds him to be a true bishop, he does not hold to have any lawful jurisdiction at Beverley or Birmingham. Few people would see any surrender of principle in giving the mere title; still it is quite intelligible that there may be a real scruple of conscience either way. To call a man bishop or priest whom the speaker does not look on as a lawful bishop or priest may to very scrupulous minds seem like the assertion of a falsehood; but in adding or not adding a mere adjective prefix of "Reverend" to a man's name there can be no question of principle any way. Such an adjective is a mere piece of courtesy which involves no doctrine and no fact. To call a man "Reverend," or worthy of respect, involves no question whatever as to the validity of a man's orders; it does not necessarily imply that he claims to be a minister of religion at all, for we have before now seen such a formula as the "Reverend Judges." If any scruple could arise, it would be about calling a man "Reverend" whose personal conduct did not entitle him to respect, just as the same scruple might be raised as to calling a man "honourable," "learned," or "gallant" who may personally not deserve the adjective which courtesy attaches to all members of his rank or profession.

"Honourable" and "Reverend" are in truth mere adjectives of courtesy, exactly like "learned" and "gallant." It is simply by accident that the one pair of adjectives sticks closer to their bearers than the other pair. In any formal description we always call the peer's son "Honourable So-and-So," and the clergyman "Reverend So-and-So"; but though the barrister and the naval or military officer are in certain formulae spoken of as "learned" and "gallant," we do not in any case speak or write of the one as "Learned John Snooks" or of the other as "Gallant Peter Tomkins." It might have so happened that, as an ordinary clergyman is called Reverend, a Dean Very Reverend, a Bishop Right Reverend, and an Archbishop Most Reverend, so an ordinary barrister might be called Learned, a Queen's Counsel Very Learned, a Puisne Judge Right Learned, and a Chief Justice Most Learned. And if the army had adopted a like ascending scale of gallantry, we might have questions raised whether Volunteer officers were entitled, any more than Nonconformist ministers, to the special adjective belonging to their Volunteer rank. It is mere chance that "learned" and "gallant," though the accepted adjectives for two professions, have not actually become part of the personal style of each member of those professions. "Honourable" and "Reverend" have stuck much closer, and of the two "Reverend" has stuck much closer than "Honourable." No peer's son puts "Honourable," no Privy Councillor puts "Right Honourable" on his card. But every clergyman, as far as we know, puts "Reverend" on his card, and we have even seen so grotesque a formula as "Rev. and Mrs. A. B." Now a man may very properly put "Lord" or "Sir" on his card, because those words are strictly titles which merely mark the fact of his rank; but the adjectives "Honourable" and "Reverend" are strictly, not the description of a certain rank or profession, but the assertion of the virtues which are thought to become that rank or profession. A man may very properly tell another that he is a peer or a baronet, which are simply facts; he should not himself tell you that he is "Honourable" or "Reverend," as that is a point about which there may be a difference of opinion. But, as things now stand, the conventionally "Reverend" man asks us, almost orders us, to revere him, while the conventionally "Honourable" man more modestly waits till we honour him of our own free will. In fact, to the clerical mind at least, "Reverend" has ceased to be a mere respectful adjective like the others; it has got to be looked on as being something even more than the description of a profession; it has almost come to be the assertion of a doctrine. In short, all these adjective titles, or, more strictly, adjective descriptions, from "Most Noble" and "Most Reverend" down to "Reverend," "learned,"

and "gallant," are simply cases of the old fashion of not speaking of any man without some respectful epithet. There was a time when people applied such epithets almost as they pleased, but usage has gradually settled what adjectives are to be given to this or that rank, office, or profession. But all this is simply a matter of usage, not of principle. To use any of them wrong, to leave one of them out where it ought to be used, to put one of them in where it ought not to be used, is at the worst a sign of rudeness or ignorance; it involves no misstatement of fact. Usage settles the whole thing. If usage dictates that the Dissenting minister should be called "Reverend," the man who looks on his claims to the ministry as a mere imposture may still give him the description which usage prescribes, just as he may without scruple of conscience apply the adjective "Honourable" to a peer's son whose personal conduct he knows to have been dishonourable, or the adjective "learned" to a barrister whose stock of legal knowledge he may know to be very small.

The stiffening of all these honorary adjectives, which were once bestowed with a good deal of free choice on the part of the bestower, into mere titular prefixes has necessarily happened gradually, and the stiffening took place in the higher ranks earlier than in the lower. But even in the higher ranks they cannot be looked on as quite settled during the seventeenth century. In the present ordination services the Archdeacon, or whoever else presents the candidates for the orders of Deacon and Priest, addresses the Bishop as "Reverend"—not as "Right Reverend"—"Father in God." But the Bishop who presents the Bishop-elect for consecration addresses the Archdeacon as "Most Reverend Father in God," and it is plain that this same address must be used when, as sometimes happens, the chief officiating Bishop at a consecration is not an Archbishop. We have before us a portrait of Bishop Pearson prefixed to the fifth edition of his Exposition of the Creed, bearing date 1683, in which he is described as "Reverendus in Christo Pater," not "Reverendissimus" or "admodum Reverendus"; but, to show how unfixed the use of adjectives of this kind still was, Pearson himself, in his dedication addressed to his parishioners of Eastcheap, describes them as "The Right Worshipful and Well-beloved." In Wharton's *Anglia Sacra*, printed in 1691, Wharton, writing in 1689, addresses his dedication to Sancroft as "Reverendissimus in Christo Pater ac Dominus," but he begins in the vocative case, "Illustrissime pater," which has never become a formal description of an English Archbishop. It would take a good deal of trouble, more perhaps than the thing is worth, to trace the exact time when each adjective stiffened from a complimentary epithet into an adjective title. Some such epithets have never come into conventional use at all. Thus, in the sixteenth century, a lady was sometimes addressed or described as "right virtuous," but "Right Virtuous" certainly never became a formal title of anybody. Among the clerical descriptions we fancy that those of Deans and Archdeacons, "Very Reverend" and "Venerable," are the most modern of all. "Vir venerabilis" was, at least as late as the sixteenth century, a common way of speaking of any man, clerical or lay, whom the speaker delighted to honour, and we have seen books in the last century, and we think in the present, in whose title-pages an Archdeacon is described simply as "Reverend." The correspondents of the *Times* are doubtless right in the inferences which they make from title-pages and parish registers to show that, all through the seventeenth century, "Reverend," as applied to a clergyman, was simply a complimentary adjective, often coupled or alternating with some other complimentary adjective, the title being Mr. or Dr. according to his degree. We remember two editions of Hooker, in one of which he is described as "that learned and judicious divine, Mr. Richard Hooker," and in another as "Mr. Richard Hooker, that godly, learned, judicious, and eloquent divine." Here we have a number of epithets among which "Reverend" is not found. None of them has stuck to the clerical order as a whole, though one of them has stuck to Hooker himself. "Reverend" doubtless stuck more easily than any other simply because of its vagueness; but it certainly did not become a merely conventional title till the last century, and traces of its earlier use lingered on till our own time. Thirty years back the University preachers at Oxford were always announced as "Rev. Mr. B."; that is to say, the man bore his title as a Master of Arts with the complimentary adjective "Reverend." Now it is "Rev. John B.," the title being lost in the adjective.

As for the correspondents of the *Times*, a seventeenth-century poet bids us not to scorn to "pick out treasures from an earthen pot." Here and there a fact may be learned even from the blunderers, or from that class yet more amusing than the blunderers—those who have got hold of a truth, but who put it in such a way as to show more ignorance than any blunder. This peculiar gift seems to be a special inheritance of those who write the "table-talk" in the *Guardian*. But it comes out also in a very respectable measure in some correspondents of the *Times*. Anyhow we must put on record, as the very first fruits of the present Silly Season, the state of mind of Mr. Brooke Lambert, who writes from Tamworth to explain to the world, with no small degree of triumph, that he does not know the difference between a Nonconformist and a Non-juror. This is a promising beginning, which it will be hard for any later practitioner in the art to outdo. Mr. Brooke Lambert is in such a desperate hurry to be thankful for a very small mercy that he sees a sign of liberality towards the Dissenting brother where the entry, if it marks anything, really marks sympathy with one who claved to the Popish Pretender, and refused the

oaths to the Protestant sovereign. Here is Mr. Lambert, Reverend doubtless, if not learned, to speak for himself:—

I am thankful, for the honour of my parish, to say that it was not withheld even in a case which reminds one of the matter discussed at the Canborno Conference. It fell to the lot of one of my predecessors to bury a Nonconformist. The entry of the burial is as follows, 1736-37:—"10 March, buried ye Rev. Thomas Worthington, a nonjuror of Tamworth." In this he only followed the example of an earlier vicar, who, when "Thomas Flavell, Presbyterian teacher of Tamworth," died, allowed him the prefix of Mr. (Master)—a prefix used with great parsimony in those days.

For Mr. Lambert there may be a possible excuse that the early associations of Tamworth, the mound of Æthelred and the minster of St. Edith, may have so occupied his mind that he felt ill at ease in such modern times as those of Nonjurors and Nonconformists. But what are we to say to the other gentleman, learned doubtless, if not Reverend, who writes from the Temple by the name of "S. P."? He is really worthy of being preserved at full length:—

Sir,—The letter of the Rev. Brooke Lambert in the *Times* of to-day is not only exceedingly interesting, but valuable for the results of labour and research displayed.

One of the instances, however, is scarcely strong enough in itself to support his argument. The term "nonjuror" did not necessarily imply a Nonconformist, and the Rev. Thomas Worthington, dying in 1736-7, might have been entitled to the prefix Reverend as having been an ordained priest of the Church of England, at the same time he would have been properly described as a nonjuror if, in consequence of his attachment to the exiled Royal family, he had declined to take the oaths of allegiance and supremacy to the Hanoverian dynasty. The conjecture—for, of course, it is nothing more—that Mr. Worthington was one of the survivors of the Carolinian and Jacobean clergy is certainly not weakened in its probability by the date of his death, and you will observe his age is not given.

I am, sir, yours obediently,

S. P.

Temple, August 13.

This is really perfect. Mr. Lambert's blunder, as a blunder, is first-rate, and is not likely to be soon outdone. But "S. P." is master of the higher art. Nobody can deny any one of his propositions. The ingenious man who wrote a book to prove that Mahomet never was a Cardinal at Rome hardly gets beyond the learned gentleman who tells us that the term Nonjuror did not necessarily imply a Nonconformist. In short, if the season goes on as it has begun, it will be one of the richest on record.

CASABIANCA-ISM.

OF all the lore which Hodge inhales at the fount of Hemans, there is probably none which makes a deeper impression than the lady's well-known lines on the youthful hero of the *Orient*. There is hardly a school-book series in which they do not figure; hardly an elementary school in which they are not over and over again committed to memory. The secret of the favour which the little poem has met with at the hands of educationists is not far to seek. Youth is inclined to unruliness and indiscipline; it is highly politic, therefore, to enforce the opposite virtue of obedience to order by a shining example, and a story which cannot fail to enlist the enthusiastic sympathy of childhood. The harassed pedagogue has good reason for trying to instil into his pupils a fervent admiration of the "boy on the burning deck," if it induces them to remain steadily at the post or task which he has assigned to them. But there is this inconvenience in teaching by models, that their influence may be too potent and preponderant, and that they may disturb the moral and intellectual equilibrium which it is the aim of education to establish. Obedience is a fine thing for the young, but it is possible to exaggerate its importance as a guide for human conduct. Mere obedience will not fit a youngster for dealing with the various and complicated emergencies of life. Presence of mind, resourcefulness, a capacity for intelligent initiative, are equally necessary ingredients in the formation of character. It is just because Mrs. Hemans's little poem operates as a discouragement, if not as a tacit rebuke, to these much-needed qualities that we are inclined to regret its immense popularity, and that we should be glad if Lord Sandon would signalize his tenure of office by decreeing its exclusion from the school-books on the list of the Education Department.

Let us attempt to define with something like precision the phrase which we have ventured to place at the head of these remarks. By Casabianca-ism is to be understood a blind adherence to the letter of an order, or of an engagement, or to a state of things, when all the conditions under which the order was promulgated, or the engagement entered into, or the state of things came into existence, have essentially altered. Of course it was an act of sublime obedience in Casabianca to remain where his father had told him, to perish in the flames, and in a child such an action was not only magnificent, but perfectly intelligible. But had he possessed the mental flexibility which comes with riper years, he would probably have perceived that the tremendous change in the state of things on board the *Orient*, since his father's order was given, virtually cancelled that order, and restored to him his freedom of action. When the order was given the vessel was intact, and in good fighting condition, and it was presumably for some useful strategic purpose that he was stationed at his post. His father was alive to direct the movements which the occasion required. The case was entirely altered by the course of subsequent events. The ship had caught fire; all but he, as Mrs. Hemans tells us, had fled; the Admiral had fallen in the conflict. In this new aspect of affairs, what he should have done, had he been as quickwitted as he was brave, was to have reconsidered his situation and the duty which had been

assigned to him, from the point of view of the exigency which had supervened, and of his father's wish, had he been alive, in the new crisis, to express it. The last thing his father would have desired was that he should stay to perish in the final explosion. Instead of indulging in that series of appeals to the wind which our poetess has emphasized with so much pathos, he should have flung himself into the waves, and endeavoured to save a life so precious to his family and to France. The annals of heroism would have been poorer by one illustrious example; but, by way of compensation, Mrs. Hemans would not have written her little poem, and the sanction of a most popular lyric would not have been given to the notion that there is no room for the exercise of common sense in the interpretation of an order, that an engagement must be fulfilled to the letter, no matter how radical the change in subsequent circumstances, and that duty does not admit of an intelligent discharge, but is a fetish enslaving the mind, or paralyzing it, like the circle of chalk traced round the silly hen, into imbecility.

Perhaps there is no class who exhibit more signal proof of having laid to heart this lesson of their childhood, and of shaping their conduct by it, than the class of domestic servants. Nothing they like better than for their masters to commit themselves to a string of standing orders for the regulation of household details, which will save them the trouble of thinking, rid them of all responsibility, and reduce them from rational beings into mere machines. What they most shrink from is a discretion, the mental labour of a doubt or a hesitation. They like to have their path made plain to them by clear unelastic rules, to which they may cling with blind unswerving fidelity until they are expressly cancelled. Master has said it, and until he unsays it, come what may, the thing is to be done. You are a man of many books and papers, and have a salutary dread of the matutinal pitchfork wielded by Eliza the housemaid. Of two evils, dust or chaos, you prefer dust. So you promulgate an order that the contents of your library-table, pigeon-holes, and shelves shall be as far as possible respected. But in giving this order you have never meant of course to interdict the intelligent use of the duster. Nevertheless the Casabianca fetich at once operates in the faithful Eliza's mind. She takes her stand mentally on a "burning deck" of her own, and is prepared to see cobwebs overspread your shelves and dust accumulate inch-deep on your writing-table, before moving a finger in contravention of her master's order. Or you are an enthusiast for fresh air, and it is a standing instruction to the housemaid that when after breakfast you leave for chambers, your windows shall be flung wide open. Of course not in all weathers; and had you been by when the darkening heavens gave warning of a tropical downpour, you would naturally have closed them. Not so does your Casabianca in petticoats interpret her duty. She will stick to the order you have given—*rua! calum!* So you return to find your chintz curtains splashed and soiled, and a pool on your pretty Brussels carpet. The mildness of two successive March mornings induces you to order that in future the fire shall not be lighted in the breakfast-room. The third day comes a frost, a nipping frost; you descend to find that your order of yesterday has only been too literally obeyed, and to eat your toast with teeth chattering with the cold. With teeth chattering from the cold you straightway order that the fire shall henceforward be lighted; and lo! on the first balmy, spring-like morning you descend to find yourself roasted like your own toast before a fire which rivals the fiery furnace of Nebuchadnezzar the King. Nor is John Thomas at all behind Eliza in assimilating and acting upon the lesson engraved on his memory by the school-book of his early years. Studious of economy, you issue a ukase against domestic expense. But of course you have never meant to place a veto on the needful repair of your wardrobe. Nevertheless your order is so interpreted by your faithful Casabianca in livery; and, pending its recall, you watch with a melancholy sort of interest the unchecked decay of your boots and the progress of the moth fretting your garments. With the terror of a builder's bill before your eyes, you have forbidden any hasty recourse to that costly functionary. But you are far from intending to expose the inmates of your household to the risk of typhoid fever through the want of a little timely attention to the drains. Yet you find on your return from the sea-side that you have been betrayed into this inhuman attitude by the blind adherence of your Casabianca of the pantry to the letter of his instructions. Anxious for an interval of thorough repose, you desire that no letters be forwarded to your retreat in the country. But a communication on Her Majesty's Service, with the signature of the Minister in the left corner of the envelope, was plainly not intended to be included in this general embargo. It is with dismay that you find on coming back that your prospects are seriously compromised by its having lain unanswered for a fortnight. You issue an order that during certain hours of the day you will be denied to all the world. But of course you never intended it to apply to your cousin the rich Indian nabob, whose rupees you are not without some hopes of inheriting. Yet you learn on inquiry that this important and irritable relative has been turned in dudgeon from your door by the Casabianca who acts as your janitor. An amusing story is told in the *Life of Faraday* which illustrates the excess of fidelity of which the domestic of the Casabianca type is capable. The great chemist had a servant, whose office it was to keep up certain furnaces in his laboratory at an even heat. On the evening the good man was released from this duty. But one night his master, absorbed in thought, retired to bed, without giving his attendant the usual permission

to depart. On entering the room on the next morning he found, to his astonishment, the faithful man still stoking the glowing fires as he had continued to do all the night long. Not having received an express order to retire, he had not ventured to desert his post, although, unless he was a perfect idiot, he must have known that his long vigil was useless, and, by unfitting him for the next day's work, mischievous. We can see nothing to admire, as a gushing reviewer found, in this trait. A much slighter effort of reason than that which the inferior animals exhibit would have led the man to see that his master's retirement for the night implied his own dismissal. Not to have perceived this argued a defect of the imagination and a torpor of the understanding which, one would think, must have led Faraday to avail himself of his future services in fear and trembling, and with the consciousness that he was attended by an Oriental slave, spell-bound by the order of a superior being, rather than by an Englishman of average intelligence.

But Casabiancas are to be met with in plenty out of the ranks of domestic service, and their disastrous action is felt in more serious matters than the small mishaps of domestic life. Not a few unhappy marriages, for instance, may be traced to the stolid fidelity to an engagement when all the conditions under which it was contracted have altered, and when, if the parties thereto were wise, they would suffer it to lapse. In his "young and curly" days the clerical Damon plights his troth to some rustic Phyllis, the cynosure of neighbouring curates. The young couple are too poor to marry, and must wait indefinitely for the college living of which Damon, as Fellow of St. Gregory's, Canford, has expectations. But the vacancy is long in coming. The obstinate longevity of the actual incumbent of the rectory of Monklands-in-the-Fen dooms them to long and weary years of deferred hope. Meantime their tender transports become cooler. Damon consoles himself with Art and Aestheticism, with Long Vacation rambles and Common-Room port. Phyllis has a much harder lot, the monotony of which is broken only by the gleam of excitement with which she studies each morning the obituary of the *Times*. At last the over-ripe plum falls. Monklands is vacant, and they are free to marry. But Damon is no longer the Damon of a quarter of a century ago; he is a confirmed old bachelor with luxurious tastes. Phyllis, too, is sadly altered. Years of waiting have told upon her spirits and temper, and she is now a sour and snappish old maid. If they were wise they would recognize the logic of facts and agree to a mutual release. But no, the Casabiancan pamelito demands its victim. The engagement which Damon contracted at two-and-twenty he must fulfil as a sexagenarian. So they marry, and are wretched for the residue of their joint lives. The sympathy of the British jurymen for the Ariadne of modern life is notorious, and it has been carried of late to somewhat extravagant lengths. But it is impossible for more dispassionate judges not to feel something like admiration for the good sense shown by not a few defendants in actions for breach of promise in retreating from the "burning deck" of ill-assorted wedlock at the cost of swingeing damages.

In public life as well as in the transactions of private and domestic existence Casabiancas abound. Their path through history is strewn with disasters or blunders. What a fine specimen of the type, for instance, is furnished by Charles I., clinging in Puritan times to prerogatives the exercise of which had been possible under the absolute Tudors, and perishing in defence of them on the "burning deck" of revolution; and again by George III., taking his stand on the "burning deck" of Irish disaffection in defence of his Coronation Oath, and refusing at the risk of a civil war to concede Catholic Emancipation. The fact is that there is in the English nature overmuch sympathy with heroic pedantry, and too little with the much rarer quality of wise audacity which discerns the moment for disobeying an order, brushing away an engagement, or breaking with a system no longer entitled to be binding, and which does not shrink from acting on its intuition. Mrs. Hemans has given quite innocently an impulse to the contrary course of action. She has invested blundering fidelity with the halo of lyrical fame, and encourages in her young readers the temper which would rather do the wrong thing under the shelter of authority than the right thing on its own unauthorized initiative. If the poem is to retain its place and its wonderful popularity in the school-book of the period, at least its effect ought to be counterbalanced by that of another short lyric in which some act of brilliant and happily-timed subordination is commemorated; say, a few stanzas on Nelson's refusal to notice his admiral's signal at the battle of Copenhagen.

COMPARATIVE HEALTH OF WATERING-PLACES.

AMONG various causes which lead people to one sea-bathing or water-drinking place rather than another, the statistics of the Registrar-General have doubtless some influence, although less perhaps than the compilers of them suppose. An invalid whose doctor recommends a "bracing" air in August would not be deterred from visiting a place where deaths from throat and chest complaints had been above the average in March. Indeed invalids are so much influenced in this matter by their doctors that they probably derive benefit from particular places as much through the imagination of salubrity as through its reality. To a great extent one place is as good as another, and a fashionable doctor who represents one place as better than another propagates a harmless, or even valuable, delusion. If it should happen that the

doctor is interested in property in the place which he recommends, that fact, although it may bias his judgment, will not greatly prejudice his patients. They believe that the place suits them because he tells them so, and their faith helps to make them whole. The notion that good air prevails in only a limited district may be compared to that which confines the reputation of a particular wine to the produce of a single hill. There are no doubt some instances of special favouritism of nature, but generally she dispenses her bounty with a large and liberal hand. It is at any rate always possible to mark a difference in wine by price; and if air were bottled and imported, we should soon find people ready to pin their faith on some particular seal as indicating a distinct superiority to all other home, colonial, or foreign atmospheres.

The seaside and summer resorts which stand highest in the Registrar-General's list will hasten to advertise their pre-eminence, while those which are placed lower will remark that after all statistics do not prove much. If no living creature goes to a place in winter, nobody can die there; and a low rate of mortality in January proves nothing as to salubrity in July. Again, a place may be badly drained, or not drained at all, and yet during nine months of the year there may be no serious fever, partly because the inhabitants are few and sparse, and partly because they are acclimatized. But in the other three months, with hot and dry weather and crowded houses, there may be much sickness and some deaths from bad air and water. We suppose that even Cologno is not always stinking, or at least not "body and soul stinking," as it is in the ordinary tourist season. Without mentioning names, we may take it as well known that several favourite seaside places in England have altogether outgrown the limited provision which was originally made for draining them, and some have adopted cheap makeshift remedies which tend rather to aggravate the mischief. If sewage be poured into the sea, it washes to and fro and in and out with every tide, and thus perhaps it is more pernicious to health, as well as more unpleasant to the senses, than if it were allowed to percolate the earth. It may perhaps have been an error of recent writers to attach too much importance to the defects which they supposed themselves to discern in sanitary arrangements. At any rate it appears that the theories of these writers are hardly borne out by the Registrar-General's statistics. But it may be answered that the statistics, and not the theories, are wrong, and we must allow that conclusions derived solely from statistics may easily be carried into error. Thus we are told that the mortality of certain seaside towns exceeds, while that of others falls short of, 17 per 1,000. It becomes highly important to know at what time of the year the numbers were taken which form the basis of this calculation. Are they merely the results of the last census with corrections, as we suppose they must be? Assuming that they represent what we will call the regular population of a town, it is obvious that the proportion of transitory to regular population will vary in different towns. Thus one town which we will call A may be a port with a steady trade, while another which we will call B may be a mere health-resort on a beach which cannot be approached even by a small vessel except in calm weather. Assume that A has a population of 5,000, and B a population of only 1,000 during nine months of the year, and that during the remaining three months each contains 5,000 visitors. Assume the rate of mortality to be 20 per 1,000 for the year, or 5 per 1,000 for three months. Then, in A there would die $5 \times 20 + 5 \times 5 = 125$ persons in the year; and in B there would die $1 \times 20 + 5 \times 5 = 45$ persons in the year. Thus the deaths in A would be 125 in 10,000, and the deaths in B would be 45 in 6,000, or 75 in 10,000; and thus it would appear that A, the place of trade, is less healthy than B, the place of pleasure. But this result would be obtained by taking the census in the season. If we took the census at dead winter we should find in A 125 deaths in 5,000, or 25 in 1,000, and in B 45 deaths in 1,000, and it would follow that A is more healthy than B. It will not be forgotten that many seaside places consist of an old town and a new, which are really separated by situation, character, and taste, and yet are treated as one town for registration purposes. Another important consideration is that the Registrar-General supposes all towns to grow at a fixed rate since the last census, whereas some seaside towns have grown from nothing into considerable places in three years.

Let us take the case of Margate, which is selected for special comment by the Registrar-General, and let us observe that the last census was taken on April 3, 1871. In the month of April the season has not begun at Margate. When it does begin, pretty close packing is, we should think, the rule in lodging-houses. We should suppose that, as compared with some other seaside places, the regular population of Margate bears rather a low proportion to the transitory population, and, if so, it follows that the apparent death-rate per thousand will be rather high. This would partly account for the position of Margate in the third class in the health scale, which the Registrar-General ascribes wholly to its imperfect sanitary arrangements. He says that it ought to be one of the healthiest towns on the coast, whereas the description given of it by competent authority in 1873 was "truly deplorable," and "we have no evidence of any efforts to carry out the great works required to restore the town to sweetness and salubrity." The water was not free from fault, the rank drains and the dirt of ages accumulated by neglect were worse even than they had been described. The Registrar-General proceeds to say that Ilfracombe, "in many ways charming," has suffered by neglecting the warning voice of its medical men, and it

stands even lower than Margate in the third class. We have no desire to weaken the force of these reproofs and warnings, but we cannot help remembering that in the autumn of 1871 some pretty strong statements were made as to the sanitary arrangements of Scarborough, which, it was said, were not adequate to the necessities of a large transitory population, and could not easily be made adequate. Yet Scarborough now stands first on the scale of salubrity. We are not surprised, as the Registrar-General appears to be, that "rival Continental watering-places" neglect to supply information corresponding to that which he obtains in England. As regards some of these places, that information manipulated by English statisticians might afford results likely to injure, and perhaps undeservedly, the character of the places giving it. The very excellence of a particular water might cause it to be resorted to in a large number of serious cases, and thus the place which produced it would be credited with a high proportion of deaths. There are places on the Continent where almost nobody lives in winter, but many people live, and some die, in summer. It would be easy to make it appear by statistics that these places are unhealthy, although English doctors send patients to them year after year under a belief, justified by experience, that great good may be derived from them. To some places it is notorious that English invalids go too late, and it is commonly said on an arrival that he or she is come to die. Yet it would be wrong to quote these deaths to prove the unhealthiness of the place.

As the Registrar-General takes so much interest in marriage, we may venture to remind him that courtship is a necessary preliminary, and that the convenience which a seaside place affords for flirtation is altogether irrespective of the completeness or otherwise of its sanitary arrangements. Besides, if *she* is at Margate, that fact suffices to restore sweetness and salubrity to that ill-conditioned town. It is a pity that some record cannot be kept of the number of young ladies who have become "engaged" during a season at each of the places included in this return. The Registrar-General might truly say that such a record would be "full of interest, and might be studied with advantage." He might deduce from it valuable conclusions as to the utility or otherwise of organizing amusements at the seaside. At the majority of English places there are no balls, because, if there were any, everybody would want to go to them, and that would be inconvenient. But we believe that at Margate there is public dancing every night, and at Scarborough there is, or lately was, dancing regularly among the company staying at the hotels. Another subject worthy of investigation would be a comparison of the advantages of boarding at an hotel or taking lodgings. Statistics upon these points, if they could be had, might, under the skilful manipulation of the Registrar-General, be made the foundation of a theory as to the means of promoting marriage. But as regards mortality, figures can only be used with great caution. It necessarily fluctuates from accidental circumstances, and "it may happen that places unhealthy in spring may be healthy in summer." We should prefer facts to figures, and if Margate or any other place is badly drained or watered, let its sanitary authorities be called to due account.

IRISH NATIONAL MONUMENTS.

MOST likely no great degree of attention has been given to a little dialogue which took place in the House of Lords shortly before Parliament was prorogued. The speakers were Lord Carlingford asking a question and Earl Beauchamp answering it. The subject was the ancient ecclesiastical buildings in Ireland which have been handed over to the Board of Works—that is, practically, the buildings on the Rock of Cashel, as the only buildings which as yet have been so handed over. In the short dialogue on the subject the parts which might have been looked for from the two noble lords were in a manner reversed. We had never heard of Lord Carlingford as a professed antiquary or as boasting of more zeal for ecclesiastical monuments than naturally belongs to any man of education and taste. Lord Beauchamp, on the other hand, is known to many as having been an ecclesiastical antiquary from his youth up. Yet here it is Lord Carlingford who appears as the champion of ecclesiastical monuments, and Lord Beauchamp as one who rather snubs them; it is Lord Carlingford who is anxious that proper care should be taken of them, and Lord Beauchamp who thinks that any care or no care is good enough for them. Lord Carlingford "asked whether the Government intended to appoint a competent person in connexion with the Board to see that the duty of keeping the monuments in a proper state of repair was satisfactorily performed." He added that "an impression prevailed among a great many people in Ireland that the Board of Works was scarcely competent with its present staff to maintain in proper condition those venerable buildings." And he further added the obvious truth that "they could scarcely be dealt with satisfactorily unless some skilled person with archaeological tastes and knowledge were appointed to look after them."

Lord Carlingford spoke the language of fact and common sense, language which everything that we have hitherto heard of Lord Beauchamp would have led us to expect that he would cordially echo. But no; Lord Beauchamp the Court official would seem to have become quite another man from Lord Beauchamp the Worcestershire antiquary. Lord Beauchamp now "points out that the buildings in question were necessarily ruins, and that the primary object ought to be to preserve them in their present condition rather than to repair or restore them." So far

so good, except that two of the buildings on the Rock of Cashel, the round tower and Cormac's chapel, cannot be called ruins. Both of these, unless they have been strangely and sadly pulled about since we last saw them, are whole and perfect buildings with their roofs on. There is really no reason why divine service—after what rite we will leave an open question—may not be again said in the chapel, and why bells may not again sound in the tower. To keep them in their present condition certainly does not need "restoration" in the sense in which people, when they have hopelessly destroyed an ancient church, say that they have "restored" it, but it may often need "repair." And the same may be said of several of the other buildings which are not yet put under the care of the Board as national monuments, but which ought to be so. With the later cathedral on the Rock of Cashel the case is different; that is strictly a ruin and needs only careful preservation. All that both classes need is not to be allowed to get into a worse state than they are in now; but the process of saving them from such a worse state is not exactly the same in the case of buildings which are already actually ruined and of buildings which are not. To draw the proper distinction, to do in each case just what ought to be done, neither too much nor too little, is certainly a matter of some delicacy, and a matter which we would have thought that every one would see, and that Lord Beauchamp would be one of the first to see, needs some measure of skill and knowledge. But the rest of Lord Beauchamp's answer to Lord Carlingford is really one of the most amazing things that we ever read:—"The work of preservation, he might add, was one which did not require any great amount of skill, and would, he thought, be better discharged by a surveyor than by a person such as the noble lord had described, possessed of archaeological tastes and knowledge." Up to the moment that we read this we had always looked on Lord Beauchamp as a member of the class described by Lord Carlingford as a person possessed of archaeological tastes and knowledge; but now we know not what to think. The notion that anybody is fit to look after such monuments as those on the Rock of Cashel; that "archaeological tastes and knowledge," that is, knowing about them and caring about them, are rather a disqualification for looking after them; that, in short, they would be better looked after by some one without taste or knowledge, by some one who knows nothing about them and who cares nothing about them, is a notion which we should not have expected to have come into the head of any man, least of all into the head of Lord Beauchamp. Then there is the strange contrast between surveyors and persons of taste and knowledge, the implied assumption that a surveyor cannot be a person of taste and knowledge. Why should he not? We know nothing of the management of the Irish Board of Works, but we can hardly believe that in choosing their surveyors they have made it a *sine qua non* they shall be persons not possessed of archaeological tastes and knowledge. Lord Beauchamp's assumption that a surveyor cannot be a fit man to look after ancient monuments is only less amazing than his other assumption, that an unfit man will look better after them than a fit one. The title of surveyor is that which is borne in various characters by several of our best architects, men of whom Lord Beauchamp cannot approve, as they are certainly not lacking in taste or knowledge. Such surveyors we conceive that Lord Beauchamp would not employ, as being lacking in the needful amount of tastelessness and ignorance. We have it now laid down on Lord Beauchamp's authority that taste and knowledge about any particular matter are to hinder a man from employment in any branch of the public service which deals with that matter. Unskilled labour would seem to be likely to rise in value wherever Lord Beauchamp has his own way. Perhaps we are to see a reaction from the excessive love of competitive examinations; or rather competitive examinations are to be turned the other way. In any department under the care of Lord Beauchamp, especially in any department which has anything to do with ancient monuments, the examination would seem likely to be carried on on the principle of a donkey race. Let a man show any degree of taste and knowledge about the matter in hand, and he will certainly be sent back to his studies till he is in a condition to show the needful amount of tastelessness and ignorance.

So much for the conversation in the House of Lords. Let us now look to the facts of the case. Lord Carlingford is certainly right in saying that an impression prevails that things are not quite as they should be with regard to the Rock of Cashel. That impression is represented in a letter in the *Dublin Daily Express* of August 8th, from one of the best of Irish antiquaries, Mr. James Graves. Mr. Graves refers to an answer given by Sir Michael Hicks Beach to a question of Mr. Mitchell Henry put in the same spirit as the question of Lord Carlingford. Perhaps in our amazement at the answer made by Lord Beauchamp we were too much overwhelmed to see what anybody else said. But Sir Michael Hicks Beach is in this matter a still more important person than Lord Beauchamp, and he, it seems, had given Mr. Mitchell Henry the answer that no inspector such as Lord Carlingford and Mr. Henry asked for was needed, because the Board of Works had no intention of restoring any of the monuments vested in them. Now, according to a report of Mr. Graves, who had been to Cashel and seen things with his own eyes, Lord Beauchamp and Sir Michael Hicks Beach, sitting at Westminster, must have been strangely misinformed as to the state of things on the Rock. Some persons, whether possessed of archaeological tastes and knowledge or not, were, as far back as the middle of June, very busily employed on the Rock, and employed in doing the very things which Lord Beauchamp and Sir Michael Hicks Beach more than a month after said were not to be done. Mr. Graves says that he

"found a very intelligent clerk of the works and a large staff of operatives in possession of the Rock." We are sorry for the clerk of the works, because, if he is very intelligent, that is a quality which comes so near to taste and knowledge that Lord Beauchamp may perhaps make interest to have so dangerous a person sent away. But we will let Mr. Graves tell his own story:—

Mr. Reade, the clerk of the works, kindly gave me every information as to the proposed operations, and I found that besides the works of simple conservation it was intended to restore:—

1. The Bishop's palace or castle.
2. The vicar's hall.
3. The east window of the cathedral.
4. The buttresses of the cathedral.
5. The battlements of the cathedral.
6. The enclosing wall of the Rock.

This is really enough to make every one—every one at least of the class disapproved of by Lord Beauchamp—who has ever been at Cashel stand aghast. Mr. Graves naturally cries out, "Now if this is not restoration, I do not know the meaning of the word." Unluckily we do know the meaning of the word rather too well, and it means something which, as applied to the buildings at Cashel, would be very ugly indeed. It means making them new; it means destroying them as ancient national monuments. None of the buildings on the Rock of Cashel ought to be "restored," even in the best sense of the word "restored." Cormac's chapel and the round tower may very likely need repair; as they are not ruined buildings, it may possibly be needful here and there to put in a new stone to keep several old stones in their places. In the actually ruined buildings we should not like to see even so much as this done; all that is wanted is to keep them from getting worse. And to go and put new battlements where the old ones are broken away, which we take to be the meaning of "restoring the battlements," is simply monstrous. But yet more monstrous is the state of things when all this is actually going on at Cashel, and meanwhile official persons get up in both Houses of Parliament and say that nothing of the kind is even going to be done.

As to "restoration" at Cashel, and indeed at many places beside Cashel, we will again quote the words of Mr. Graves:—

I have had some experience in the conservation of ancient buildings myself, and I feel persuaded that incalculable injury may be done, even in works of simple preservation, unless the workmen are placed under the constant supervision of some one perfectly acquainted with the characteristic features of the various styles in which our ancient churches were built. When it comes, however, to restorations such as those which are in progress, or contemplated, at the Rock of Cashel, the unmitigated oversight of a properly-qualified inspector is absolutely necessary, if the character and authenticity of our "national monuments" are to be preserved.

If there is anything to be said against this, it is that Mr. Graves is a little too mild, that he lets off the notion of restoration of any kind on the Rock of Cashel rather too easily. Mr. Graves, in short, speaks on this head much as, up to his answer to Lord Carlisle, we should have expected Lord Beauchamp to speak. What may be the cause of this change in the noble Earl it is not for us to guess. But at any rate in the next Session both Lord Beauchamp and Sir Michael Beach will do well to take care that the answers which they make to questions in the two Houses of Parliament shall not be the direct opposite of the facts.

THE MODERN SAVAGE.

WITHOUT venturing to pronounce an opinion whether a fight between a man and a dog did take place at Hanley, we may at least say that the locality was not ill chosen for lending an air of probability to such a narrative. Indeed we might go further and say that in Lancashire, which is not far from Hanley, more brutal and barbarous proceedings than this fight habitually occur, and the law has hitherto appeared powerless to prevent them. Dogs delight to bark and bite, "for 'tis their nature to," and it is rather a stretch of language to say that it is cruelty to a bulldog to let him go at a man. Probably both the dog and the man would rather fight than not. It cannot be doubted that such fights have taken place. Many years ago, says a competent authority, dog-fighting was a fashionable pastime in Staffordshire, and hence the selection of Hanley as the *locus* of such a story would be perfectly appropriate. We heard not long since of a man who for a bet would draw a badger as a dog does. It is not more surprising that a man should match himself against a dog. The Mayor of Hanley, while assuming that the fight was "a myth," complains of "reflections upon the character and conduct of the Potteries in general, and Hanley in particular," which, we fear, are not wholly undeserved. Mr. Greenwood answers the Mayor by asserting that "such sport and worse is not unfrequent in the Black Country," and there is reason to fear that Mr. Greenwood is correct. He ascribes to himself a desire to poison "the dirty-white bulldog" which was afterwards one of the combatants, but we cannot see why he should entertain that idea. A bulldog only acts according to his light in pinning another dog or a man, and we are clearly of opinion that he is not the most objectionable creature that the Black Country contains, and might indeed afford a model of good manners to some of its inhabitants. The Correspondent of *Land and Water*, who sought for traces of the alleged fight, confesses that he is "a great lover of bulldogs, and not averse to a good boxing-match," and he thus felt a double interest in Mr. Greenwood's story. He found at Hanley an old man who had lived in that town fifty-one years. Years back, said he, cock-fighting and dog-fighting were very

common, but they were things of the past. He had read "Brumby's" fight with "Phisic," and did not believe a word of it. He had heard a story of a man-and-dog fight in his early days. The Correspondent stumbled upon an old member of the P. R. whom he once saw at work in his palmy days, and this gentleman says, and we incline to believe him, that if there had been such sport he must have seen it or heard of it. He also spoke "in a quiet, earnest way" about the reward of 20*l.*, which the Correspondent thinks would be very useful to him just now. On the other hand, Mr. Greenwood "reasserts, with the utmost emphasis, what he has already written on the subject, and is confident that at no distant date the strict truth of the incident will be fully proved." And thus the matter stands at present.

It is strange that such a question should arise and appear so difficult of solution. Our present object, however, in referring to it is to remark that a considerable number of people think that this man-and-dog fight, even if it did not happen, yet might happen. We do not wish to wound the just susceptibility of the Mayor of Hanley, and therefore, if we use the name of that town, we regard it only as typical of what Mr. Greenwood calls the Black Country, where mines and furnaces abound. We should be glad to believe that Mr. Greenwood's story is a myth and a libel on the district. But even if dog-fighting has gone out, it appears that other and worse things have not gone out, or have come in. There are two music-halls in Hanley, and we believe that other towns of equal importance are similarly provided. Fifty years ago there were no music-halls, and there were dog-fights and boxing-matches in plenty. Now boxing and perhaps dog-fighting have gone out, and undeniably kicking has come in, or at least is in. The Correspondent of *Land and Water* says that "he is not averse to a good boxing-match," and it really begins to look as if the rules of the P. R. might be, in the Black Country, civilization. One of these rules, against hitting a man when he is down, was formerly received almost universally by Englishmen. Thus much at least of manliness the P. R. taught its votaries, and the lesson is greatly needed now. If there was a row in the streets, the passers-by formed a ring and saw fair play. If two or three men set upon one, they would be restrained, and compelled to fight turn and turn about. But now, when the progress of civilization has destroyed the P. R., there seems to be nothing in its place. The papers are constantly giving accounts, most frequently from Lancashire and Durham, of two or three men setting upon one, knocking him down, and kicking him as he lies upon the ground with boots studded with heavy nails or tipped with plates of iron. Some of the cases of kicking which have been lately reported are not only worse than a fair stand-up fight in a well-kept ring, but we had almost said that they are worse than the alleged man-and-dog fight which is such a libel on the town of Hanley. It would be at any rate fair give-and-take between the man and the dog, and the man for himself, and the owner of the dog for him, would have the opportunity of crying "hold enough." Both the man and the dog, too, would be confined, as we understand, to the weapons which nature has supplied; and, although they might cause each other intense pain, they could less easily inflict irreparable injury. Nevertheless, a fight between a man and a dog probably would be, and certainly ought to be, a "sickening spectacle." The description of it, and still more the thing itself, must be shocking to any decent mind. Yet if such a thing occurred anywhere, it would probably be in a country where kicking with iron-shod boots is habitual. It is even said that women have taken to kicking as well as men; and, if this be so, we shall really think that the Black Country is progressing backwards. In the palmy days of the P. R. it was assumed that women fought only with their tongues, or at worst with their finger-nails. The collier who said when his wife beat him, "It pleases her and it don't hurt me," would scarcely perhaps have been so quiescent if she had kicked him and jumped upon him with iron-shod boots.

The frequency of these kicking and jumping cases may lead us to inquire whether, as regards a large mass of mankind, there either has been or can be anything that deserves the name of civilization. Macaulay instances several points in which he thinks that, comparing the time when he wrote with the beginning of the eighteenth century, there has been a softening of manners. But if the common people kick in a state of civilization, what must they have done in barbarism? This week a woman has been charged with "cruelly assaulting and stamping upon" her daughter of eight years old. The child stated that her mother was very angry because the place was in a mess, and she first slapped her, and then knocked her down and jumped upon her and kicked her while she was upon the ground. A medical witness found the body, legs, arms, and shoulders of the child nearly covered with bruises. The mother was sent to prison for six months, declaring that "she would not forget" the witnesses who had appeared against her. This case, which was brought forward at Worship Street Police Court, is really more alarming than the man-and-dog fight, supposing it to have occurred at Hanley. At the worst there is only one "Brumby," but women capable of misusing children seem to be numerous, and the propensity for what may be called "kicking murder" has become epidemic. The hour for closing public-houses is specially productive of this sort of violence, and although the Black Country enjoys a bad eminence in these outrages, they are not confined to it. A publican wishing to close his house used such force as was necessary to expel a man who had been drinking there. The man having been pushed out returned, and, taking a reaping-hook with both hands, made a chop with it at the publican's

head, of which the effect, as described by an eyewitness, was that "the back of the victim's head hung down his neck." Fortunately the wound was not mortal, and the man is likely to recover. This case occurred recently in an agricultural county, and rivals in brutality the worst of those kicking cases which have been lately so frequent among the puddlers of the North. We may add that the ploughman's boots, if he took to using them in the same way, would be quite as formidable as the puddler's. It appears like, while such cases occur, to suppose that among the bulk of the mining, manufacturing, and rural populations any real progress in civilization has been made. Probably many of our readers will by this time be of opinion that, if such a thing as a man-and-dog fight has not, it easily might have, happened at Inverley. Indeed we do not think that this fight, assuming that it did occur, would be by any means the worst thing that has occurred in the Black Country during the present year. Both the man and the dog would obey the impulse of their savage natures; but it cannot be alleged that a man who is knocked down and jumped upon with heavy boots is other than an involuntary sufferer. The knife of Southern Europe is a terrible weapon always ready for use at the dictate of passion, and this is exactly what may be said of the iron-shod boot of Lancashire. It is in fact impossible that any people of any country or period could carry brutal violence further than it has been carried in the kicking cases lately reported from the mining districts of England.

All orders of society, and especially the lower orders, have derived, says Macaulay, important benefits from "the mollifying influence of civilization on national character." Recent experience inspires a doubt whether these important benefits may not be imaginary. Indeed, almost the only point on which we feel sure is that at the time of which Macaulay writes barbarity was expressed by punishment, and if the barbarity remains the same punishment ought to be applied to it. The most recent example of "ruffianism" which has ceased to be "extraordinary" comes from Birmingham. Three men assaulted a married woman as she was standing at her door with her husband. The husband remonstrated, whereupon he was set upon and kicked. He retreated, and the gang followed him, knocked down an aged woman and jumped upon her, and throw her down a flight of stairs. After they had committed more violence the police arrived, and the "roughs" defended themselves against arrest with a poker and a ole. Imprisonment is not an adequate punishment for such an outrage as this, and it begins to appear necessary to resort to the method of the seventeenth century, by which the "roughs" of the period were brought summarily to a whipping-post.

A DAY OUT OF TOWN.

THE third-class excursions indicated in the daily papers by the title of "days out of town" have of late years become quite as much a recognized institution as the press of Parliament. The excursionists are to be met with everywhere at this season. They are the terror of elderly ladies who, having paid for first class tickets, justly expect their full share of a first-class carriage to be reserved for them. They are the recognized prey of railway accidents, and are excuse for all deviations from the published time-tables. In picturesque neighbourhoods they are the thorn in the flesh of the regular residents, who find, where every prospect pleases, that not only men, but women and children, and especially infants in arms, are vile. They are the subjects of many a pathetic appeal in the *Times*: they are the joy of country public-houses, and will empty an ordinary beer-shop at a draught. To the railway porter, whom they defy, they are the scum of the earth. To shunt a luggage train into a large party of them he cannot be persuaded to regard as anything worse than an accident. They strew broken glass over the fairest valleys in England; they litter Bushey Park with orange-peel, and whiten the graves of Cistercian abbots with old newspapers. Where archaeologists go, they go, but they do not revere; where landscape-painters paint they sing. They eat pork-pies on the upland lawn, and dance merrily round the aged thorn. They stare vacantly at Hampton Court beauties, and listen unmoved to the words of housekeepers in show places. They thirst much and perspire much, but on the whole seem to enjoy themselves. Their hearts are light, if only for one day, and, since two score of them are an ordinary load for a pair of horses, it is to be hoped, in the interests of humanity, that their bodies are light too.

A little guidance and sympathy might sometimes be well bestowed on these nomadic hordes. There is a humanizing influence in fine scenery and venerable associations to which they are not wholly insensible. But the feeling needs to be called into play. They cannot apparently awaken it for themselves. The people who are most capable of instructing them without tiring them are too much given to despising ignorance, and have no idea of coming to meet it. Yet when, by chance, a party of excursionists hear a stirring address on the history of some old ruin or the field of some great battle, the speaker has never to complain of any want of attention. This sort of thing is left too much to clergymen. The very fact that it is their duty to do it makes it distasteful to excursionists who have come away from duty and all connected with it for the day. The difference may be seen when a party of operatives, a working-men's club, with its committee to organize, is compared with a school treat, where a very different system of management prevails.

It is very easy to give school children a feast of buns and tea.

The daughters of the squire feel that they look their best as, in artistically simple costumes, they hand the bread and butter or fill the overflowing cups. How becoming it is to play ball with the little ones, or minister tenderly to the consolation of some chubby darling who has broken his knees in a race! These offices are their own reward. They combine in sweet proportions the beautiful and the good. Mamma for once overlooks a little flirtation with the curate or some other ineligible. Her face beams with motherly kindness as she looks towards the human creatures who at other times are so very far off. It is much the same when the village choir visits the rectory. In the country the clergy are the great levellers, and at a church luncheon or a harvest festival the old woman from the almshouse is helped to chicken by the county member, and the bishop's wife is indebted to the schoolmaster for the salt. But in the great manufacturing towns, and above all in London, such social amenities are impossible. So at least most of us think. The lady who can organize a Christmas-tree for the Sunday scholars of her country village, who can call together mothers' meetings and arrange all the details of a bazaar for the restoration of the church, would stand appalled before the prospect of entertaining a hundred dock labourers from the East-end, and would succumb altogether to the effort of receiving their wives and children. From them, notwithstanding her most elaborate blandishments, she will receive no pretty courtesies, nor will a single forelock be pulled upon a single head. They cannot sing, or, if they could, her hair would stand on end at their songs. They cannot distinguish between grass and gravel in the garden, and will lie at full length upon her mignonette. The children cannot play in the sunshine which they have never seen so bright before. They cannot run races, for they have never run in town. Two of them will be found plotting in a corner the surreptitious concoction of a mud-pie from the contents of a new flower-bad. Two more will be detected in imprudent investigation of the beehive. The women will shock her susceptibilities even more. Their shabby finery, their loud voices, their rough language, their fear and contempt for their husbands, their chastisement of their children, their nourishment of their babies, all the coarse and suchlike things will horrify her. But above all she is surprised at their want of reverence, their complete insensibility to her exalted dignity. They take no notice of her presence, or they ask personal questions with simple directness, and contradict her with prompt readiness. When she gives them her strongest tea and bestows upon them her sweetest buns, they openly hint at a preference for beer, and even insinuate the addition of a drop of gin. When at length they are gone she vows that her efforts in this direction must cease, and that henceforth she will content herself with the enjoyment of such charity as her own neighbourhood permits.

The Lady Bountiful's disappointment, however, would be mitigated did she know that her kindness was not quite thrown away, that the day at her house is long remembered with pleasure, that her guests were wholly unconscious of their own deficiencies of manner, and quite ready to pardon her haughty deportment. If the same party came back to her a second year, she would find them improved; improved from her point of view, that is. The mollifying influence of gratitude would show itself in a less shy reserve on the part of the men, and a little more delicacy on that of their wives. They would greet her with a smile, if not with reverence, and would perhaps address her with something akin to respect. Perhaps in the long run she might even discover that they were subject to like passions with herself, that they were not altogether exempt from tender feelings, and could be softened by the exercise of sympathy. Without some bond of the kind it is hopeless to attempt any intercourse between the poor and the rich which will not do more harm than good. The experiment has been tried with success. There are houses in London, nay, even in the fashionable squares of the West, where it has succeeded. Parties are given now and then. The streets and lanes of a crowded district, in Westminster or Soho furnish the guests. The silk and velvet hangings of the drawing-room and the picture-gallery are uncovered. The family plate is on the supper-table. Flowers are everywhere, and a nosegay is provided for every guest. Young gentlemen come too, and read a ballad from Tennyson or a chapter from Dickens. Young ladies sing "Annie Laurie" and "Home, Sweet Home," and the hard look dies out of stony faces, and tears run down from bleared eyes; the long-forgotten days return, the vows made years ago at some country confirmation, the advice of parents dead and buried, the love of hearts and the sound of voices long silent, rise up like incense and perfume many a weary day afterwards. The servants are seldom unwilling to enter into the spirit of such occasions. They too may be benefited, incredible as it may seem to their lofty minds, and a little of the contempt of their race for the vulgar crowd may be removed.

There are, however, great difficulties in the way of such efforts as these. If you have a few acres of grass in the country, or even a large back garden in the suburbs, you may manage with more ease. Something of the kind has been done by bringing a party from Lambeth or Rotherhithe up the river in a steamboat. The tea is laid in the garden, and the grass is abandoned to the tramp of heavy feet. The men are allowed to smoke their pipes, and cigars are offered to those who prefer them. An extempore booth is constructed, and a play performed by the young ladies of the family. It represents some domestic story calculated to interest and move the feelings of the audience—the loves of the two servant-maids, perhaps; the rival fascinations of the shopboy and the baker's man; the joys and sorrows of home; the evil effects of

excessive alcoholism; the man who beats his wife, and the woman who scolds her husband, with the old moral of Hogarth's apprentices, and not too much sermonising to point it. It is not given to every one to be able to accomplish such things. But something of the kind may be done; and when, as the evening wanes, an orator is chosen by the party and mounted on a form to deliver himself nervously of a string of words, chosen more for their magnificent length and sound than for their absolute appropriateness, he yet conveys unmistakably the hearty thanks of self and mates for the entertainment, and it is easily perceived that something has been done, not without the attainment of a measure of civilizing influence.

The great difficulty and drawback about excursions from London is their eleemosynary character. The appeals in the daily papers are for subscriptions from the wealthy to take the schools or clubs of some poor district for a day in the country. We cannot help thinking that this might be better managed. One or two clergymen and organisers at the East-end have tried a different system with success. A small monthly subscription throughout the year, or a small payment by tickets at the time, suffices to cover the expense of chartering a steamer or a excursion-train, or to pay for a few vans. What is then wanted from the wealthy is leave to visit a park, or to walk through a great house, with a gift of fruit and flowers, and perhaps the loan of a tent for dinner. These are things which money cannot buy, and for which subscriptions are subscribed in vain. Shady trees, many banks, a limpid spring, a few hampers of cherries or gooseberries, and a few baskets of roses are worth more to excursionists from London than anything they can buy at home to take with them.

GREAT ADELPHI DRAMAS.

THE genuine old Adelphi drama holds its ground against all the frivolities of the modern stage. The only fault that can be found with the *Prayer in the Storm* as a work of sensational art is that the grand effect occurs at the end of the second act, or less than half way through the piece. There is, indeed, a good deal of talk about skirmishing with Indians in the third act, and we even hear the sound of firing, but, as a sentry in uniform walks the stage composedly throughout, we are not greatly disturbed by that which he so manifestly considers unimportant. The play begins on the deck of a ship belonging to the French navy, about the year 1708. An adventurer named Pedro persuades part of the crew to mutiny, while part remains faithful. In a scuffle on deck the captain gets Pedro down, and is about to kill him, when an ally of Pedro seizes the captain's little daughter, and by threatening to throw her overboard obtains a reprieve for Pedro. There is, of course, a grand tableau. The captain stands over Pedro threatening death, a repulsive-looking scoundrel holds the child in his arms, the mother rushes screaming upon deck. Pedro, having escaped, turns the tables upon the captain, who is now disarmed, and placed with his wife and daughter and a faithful follower, who has a talent for being funny under difficulties, in an open boat, and turned adrift to encounter harrowing perils in the Arctic Sea, amid which the comic follower delights the audience by lamenting that he cannot go back to Putney. This simple species of drama flourishes irrespectively of hot weather and the assumed captivity of London. The operas are closed, and a French manager is performing the last scene of all in the Court of Bankruptcy; but still the familiar spectacle of a combat with cutlasses and pistols on a ship's deck at sea suffices to win applause from full pit and galleries at the Adelphi. The newspapers have lately passed severe criticisms on M. Hervé's "Ashantee Symphony" at Covent Garden Theatre, in which, however, the clever composer knew quite well what he was doing. His work is—to use the only suitable word—"bosh," and he never meant it to be anything else. Whether he has rightly gauged the taste of London in the autumn may perhaps be doubtful. There must be many thousands of persons still left within two miles of Covent Garden who think that sufficient fuss has been already made about the Ashantee war. Sir Garnet Wolseley could hardly decline the dedication of this "heroic" composition, which we think, but are not sure, is slightly too heroic for English taste. It is only natural that M. Hervé, like other imitators, should go a little beyond his model. There is a story of a Frenchman, who valued himself on being a citizen of the world, telling an assembly of Heads of Houses and Dons at Oxford that "when he was in England he said 'Goddam' with the English." There was a picture by the lamented John Leech in which an English huntsman shouts after an excited French gentleman in faultless coat and top, "Hullo! there, you Sir, do you think you can catch a fox?" and the Frenchman answers, "I do not know, mon ami, but I will try." In both these instances the foreigner is slightly more English than the English themselves, just like the hotelkeepers in Belgium and Germany, who give us much more roast beef than we should get at home. In the same way we suggest that the patriotic self-complacency of Englishmen at the glorious result of the Ashantee war has perhaps been in a trifling degree exaggerated by M. Hervé. We say "perhaps," because we thought so before seeing the *Prayer in the Storm*, and our opinion has been rather shaken by observing the success which an artist too modest to give his name has there attained by laying on colour thickly. There has surely been no prayer so successful as that upon the stage since the *Crucifix* was produced, and we fully adopt the opinion of Mr. Puff that "in great emergencies there is nothing like a prayer." The captain,

with his wife, daughter, and faithful follower, are encamped upon ice which is expected to break up when summer comes. The faithful follower describes in his comic vein adventures with Polar bears; while the captain breaks up his boat to furnish fuel to his shivering family, and thus destroys their only hope of safety, when amid a tremendous storm the ice divides and sinks beneath their feet, giving place to billows which are worked with tremendous energy by the machinists. A glorified vision of the mother is seen floating into eternity on a block of ice. Both parents perish, but the daughter and the comic servant escape to suffer adventures through three more acts, which are necessarily tedious after the excitement of the first two. The daughter, who has been brought up by Indians, is attracted by the sound of a half-remembered language to a French settlement in California, where she encounters her aunt and cousin, and also the adventurer Pedro, who has become immensely rich by the discovery of gold. The whole party find their way back to France in the time of the Regent Orleans, and the comic servant, notwithstanding his ardent desire to return once more to Putney, has managed to make himself tolerably well at home in Paris. There is a noble lover of the cousin, between whom and Pedro there had been talk of a duel in California, and Pedro himself professes to be in love with the girl (now reclaimed from Indian feathers and paint, and dressed in the highest Parisian fashion) whose parents owed their death to him. Ultimately Pedro's ill-gotten wealth fails to secure his influence with the Regent. Crime is baffled and virtue is rewarded, as is necessary in all plays which appeal to the unfashionable multitude for its patronage.

Another "great Adelphi drama" holds possession of the Princess's Theatre. Both as actor and author Mr. Webster has had considerable success, and in both capacities he is preferable to his imitators. His well-known play of *Janet Pride* contains no grand sensational scene, and there is a suitability to recent circumstances in the arrival of an adventurer under an assumed name from Australia. A convict desiring to return home could scarcely, however, assume a more dangerous alias than that of an ex-sergeant of a line regiment, which part would be even more difficult to sustain than that of a retired officer of carabineers. Whatever else may be obliterated by time or art, we may be tolerably sure that the habit acquired by twenty years of being drilled and drilling would be indelible. But we must allow something to the necessity of getting Richard Pride back to London in order to begin the play, in which he steals a watch, and so contrives that his own daughter, whom he does not know, is accused, upon apparently conclusive evidence, of the theft. In the last scene, which represents the Old Bailey, Janet Pride is tried for this theft before the Recorder, in whom the majesty of the law is sustained by a sufficiently red nose. As several modern dramas introduce a court of justice, we must suppose that the curious travesty of legal proceedings which they represent is interesting, and we are justified in assuming that the reality of such proceedings is more interesting still. An average trial at the Old Bailey would afford more entertainment than the last act of this play, and would be as well attended. The play, of course, has a moral of the clearest type, as all plays of its class have. Drink brings Richard Pride to ruin. He has committed his first crime and has escaped to Paris with his wife and child. While the party are starving in a garret, he abstracts from a drawer the last little hoard of money that his wife has, and spends it upon himself and some jolly companions at a tavern. His wife, hopeless of the child's welfare, determines that it shall be brought up as a foundling, and falls dead at the moment of accomplishing, with abundance of despairing gestures, its deposit at the gate of a hospital. A woman in rags staggering and falling in the snow is probably a more common incident in Paris than a drunken Englishman leading a party of drunken Frenchmen in a chorus of "We won't go home till morning." However a play of this kind requires strong effects, and Mr. Webster and Mrs. Mellon are eminently qualified to produce them. Richard Pride recognizes his dead wife, and is at the same moment arrested under an extradition treaty and carried back to England to be tried and transported. It is not the least of the difficulties of the modern dramatist that he can no longer transport his hero, as could be done when Mr. Webster wrote this play. Richard Pride escapes from the penal settlement, assumes a picturesque costume of skins, takes a partner, and sets up in business as a bush-ranger. Sergeant Grey, who has just taken his discharge from the army and received arrears of pay, and is going home to England, is treacherously murdered by Pride's comrade, whom Pride thereupon shoots for violating that sense of honour which prevails among all right-minded convicts. It is clear that, if Western Australia had known of the existence of Richard Pride, that colony would have applied to have allotted for its service a felon of such elevated principles. He possesses himself of the papers and money of the murdered sergeant, assumes his name, and returns to England.

Thus far is only prologue. The regular play opens at the lodging of a French watchmaker in Greek Street, Soho, where Richard Pride, under the name of Grey, has somehow become domesticated, while his daughter Janet, who was brought up at a foundling hospital in Paris, and whom he does not know, is living with the watchmaker as a servant. A customer calls upon the watchmaker, bringing for repair a valuable watch, and Richard Pride sees in him the master whom he robbed twenty years ago, and he fears that the recognition will be mutual. He determines to quit London, and to steal the watch to obtain the necessary money. Burglary

to low slow music is an ordinary incident of these plays, but this burglary in Greek Street is delightfully complicated by somnambulism. An apprentice who is Janet's lover, and does the comic business of the piece, is set to guard the valuable property in his master's workroom, and of course goes to sleep. Richard Pride enters burglariously by window with dark lantern, and extinguishes rushlight. Janet Pride enters walking in her sleep, and indicates by pantomime anxiety for the safety of the valuable watch. Exit Richard Pride by one door, and enter the watchmaker, who fancies he has heard a noise, by another. The result of this ingenious jumble is that Janet Pride is accused of the theft which has really been committed by her father. She is taken to prison, where her father visits her, and she is tried at the Old Bailey, with one learned gentleman in a wig to prosecute, and another learned gentleman in a wig to defend, and the Recorder in a bigger wig to sum up. At the moment when the jury are about to give their verdict, Richard Pride shoots himself in the purlious of the Court, and enters it with faltering steps to declare his own guilt and his daughter's innocence. The Recorder and the Bar form a sort of chorus to his last dying speech and confession, upon which the curtain falls. The audience, it is to be hoped, are duly impressed with the moral of the play, that drinking leads to crime. Mr. Webster, who seems to be now making the first of a series of last appearances, has doubtless chosen this as a part in which he has conspicuously shone. His unquestionable talent has usually exerted itself in rather a barren field. But, although we find the "great Adelphi drama" a small and poor affair, it is at any rate equal to keeping two London theatres going in the month of August. Both as actor and author of this sort of drama, Mr. Webster has attained whatever eminence it could confer.

REVIEWS.

BIRKS ON MODERN UTILITARIANISM.*

WHEN we reviewed Mr. Birks's first volume of lectures last winter, we expressed a faint hope that he might show himself less incompetent when he came to examine the opinions of other teachers in moral science than when he attempted to give an account of his own. That hope, such as it was, is now wholly disappointed. We have to say, as we said before, that were it not for Professor Birks's official position at Cambridge, his treatment of moral philosophy would not be worthy of serious notice. The faults which we then censured are now repeated with little or no amendment. Professor Birks appears to be a well-meaning but short-sighted theologian who is thoroughly frightened and angry at the whole course of modern thought and speculation, and cannot make up his mind either to welcome new things with such men as Mr. Kingsley, or to stand up and fight against them with such men as Archbishop Manning and Father Dulguais. His attitude is more like that of the people in the *Water-Babies* who spent their lives in crying "O don't tell us" and running away. Professor Birks is filled to overflowing with wrath against the wickedness of utilitarian morality. He cannot consider with any calmness the opinions of those who differ from him, and the clear stream of reason is swallowed up in hopelessly troubled outpourings of *odium theologium*.

The plan of this work is to examine and compare the three modern types of utilitarianism as presented by Paley, Bentham, and J. S. Mill. By fixing these limits Mr. Birks has gained two things. One is the rhetorical antithesis between Cambridge (meaning Dr. Whewell and other opponents of Mill) as the head-quarters of truth, and Westminster (meaning the founders of the *Westminster Review*) as the head-quarters of falsehood, which antithesis is the chief grace of Mr. Birks's chapter of historical introduction. The other is a greater matter. This limited plan enables Mr. Birks, both in the introduction and throughout the lectures, to take no notice whatever of Mr. Herbert Spencer or Mr. Darwin. This of course saves a great deal of trouble, and will make Professor Birks's defence of what he calls objective morality much more plausible and complete in the eyes of students of moral philosophy, if any such there be, who are not aware of the wholly new strength given to the empirical theory of morals by Mr. Spencer's and Mr. Darwin's work. What Mr. Birks may think of it of course we cannot tell. Perhaps he really does not know that he has yet more enemies to speak with in the gate after he has excommunicated Bentham and Mill to his heart's content. Perhaps he thinks Mr. Spencer and Mr. Darwin are such abominable heretics that it is a shame even to speak of them in a University chair. Perhaps he means to do battle with them also in due season, and is now only trying his arms. We can find only one phrase that gives any clue, and that is a doubtful one. Professor Birks speaks of "some reasonable regard to the accumulated and inherited experience of mankind." Can he possibly be ignorant of the meaning now borne by those words? Or does he obscurely hint that he is willing to seek even such dangerous allies as Mr. Herbert Spencer against the teachers he specially abhors? We cannot tell. Subject to these doubts, however, the course Professor Birks has so far taken seems to us much as if the engineer of a place besieged by modern artillery should spend his time in "examining and comparing" the

battering powers of catapults and mangonels. There are one or two other odd things in this same introduction. Professor Birks claims the support of Mr. Hutchison Stirling and Mr. Lecky, but misspells both their names in doing so. He does not notice the short but weighty restatement of the questions at issue and the utilitarian answers to them which has lately been made by a Cambridge man—we mean Mr. Fitzjames Stephen's *Note on Utilitarianism* at the end of his recent book. To be sure it is on the wrong side, and so might spoil the antithesis of Cambridge and Westminster. But the oddest thing of all, if indeed we should not use a stronger word, is that Professor Birks actually charges J. S. Mill with having been afraid of publishing his real opinions in his lifetime:—

His *Autobiography* has placed in clear relief what nearly all discerning and intelligent readers must have suspected before, that his sensationalism in metaphysics, and utilitarianism in ethics, were really connected with an early formed and deep-seated antipathy to all the distinctive features of the Christian faith. It is well that the veil should at length be withdrawn. It is no sign of that heroism, the want of which in Paley he has condemned with extreme severity, that it should have been permitted to rest upon his true opinions on these subjects so long.

Mill was certainly not wont to err on the side of caution in expressing what he felt on most subjects, and if he never made any statement in positive terms of his belief or unbelief on theological subjects, it was because he wrote as a philosopher and not as a theologian; but that is just what Mr. Birks cannot abide. Besides, it is idle to talk of a veil having been withdrawn. The opinions in question could be no matter of mere suspicion to any reader of ordinary knowledge and judgment. It would be hard to find a more unfair or ungenerous charge against the memory of a man who was notoriously so far from being given to dissimulation that he was incapable of it even in cases where it is commonly thought right and wise. As for the "sensationalism in metaphysics" of a thinker one of whose latest essays was an admirable exposition of Berkeley's immaterialism, it may serve as a specimen of Professor Birks's accuracy in the use of philosophical terms.

It would be an unprofitable task to follow the Knightbridge Professor through all his carpings and chidings. For reasons already hinted at, we hold it a matter of great indifference whether more holes can be picked in the system of Paley or of Bentham, or whether J. S. Mill was wise or unwise in treating Paley with so little respect as he did; nor has Mr. Birks dealt with these topics so as to invest them with any peculiar interest. The thing that comes out most clearly is that Professor Birks has yet to learn the rudiments of controversial civility. J. S. Mill has said in effect that the value of Paley's work is much lessened by a presumption, arising from inspection of the work itself, that he set out, "consciously or unconsciously," to prove foregone conclusions. Now Professor Birks treats Paley with comparative tenderness, considering that he was a Cambridge man and had a "sincere faith in a diluted Christianity." So hereupon he falls into a mighty rage and talks (notwithstanding the saving words we have cited) of indirect calumny, imputing corrupt motives, and the like. There is, in fact, no attack on Paley's personal character except in Professor Birks's imagination. The fault J. S. Mill rightly or wrongly found in Paley is not moral, but intellectual, and is one from which hardly any man can hope to be entirely free. The power to form a wholly unbiassed judgment on any question other than a question of fact in which one has no interest is a rare and difficult excellence of mind. But it is natural that Professor Birks should impute to others the sort of personal feeling which he himself brings to the discussion. In the same way he cannot be content with saying that he thinks Bentham's comments on the "ascetic principle" unfair, but must needs pass a solemn moral censure upon Bentham for bearing false witness against his neighbour. Bentham on the whole fares the worst of all the three heretics at the Professor's hands, as having been the most plainspoken and aggressive. Mr. Birks is not satisfied with demolishing his morality. Early in the book he makes a grudging acknowledgment of Bentham's "partial merit as a jurist," but later he takes much pains to say that, although he does not profess to be a competent critic of Bentham's jurisprudence, it is nevertheless his "deep and settled conviction" that when a man's ethical speculations are so shocking his legal speculations must be very nearly as bad. It is suggested in one place that Bentham's influence has been much overrated, and in another that it may be answerable for the present troubles of France and Spain. To crown all, Mr. Birks assures us that he does not remember "in the course of forty years to have met with any one who professed himself indebted to Bentham for a single important idea." We can only suppose that during that time Mr. Birks has employed a skill and diligence worthy of a better purpose in confining his conversation to persons of his own way of thinking. In the midst of these amenities the reader will be agreeably surprised to learn that Professor Birks disapproves of "reckless abuse of celebrated writers whose religious creed or political leanings displease us." Bentham and Mill are celebrated writers whose religious creeds and political leanings displease Professor Birks; but either they are too bad for any abuse of them to be reckless, or Mr. Birks has different notions from most people as to what amounts to reckless abuse. Besides these personal attacks, there are a great many metaphorical flowers of speech designed to set forth the meanness and wickedness of utilitarianism. The system is compared to the bridge built by Sin and Death in *Paradise Lost*. We are also told that it "will swiftly land its disciples in a blind, dark, and gloomy fatalism." A favourite image is the contrast between the "low marsh-lands" of utilitarian morality and the "lofty mountain-tops"

* *Modern Utilitarianism; or, the Systems of Paley, Bentham, and Mill Examined and Compared.* By Thomas Rawson Birks, Knightbridge Professor of Moral Philosophy. London: Macmillan & Co. 1874.

which Professor Birks says he was especially disappointed at not finding in Locke, and which, we presume, he finds in himself. We are as much in the dark as ever as to what these mountain-tops of the true objective morality may be. For we still find only vague phrases about a kind of moral geometry—a metaphor the danger of which we formerly pointed out—and “an ideal standard of humanity . . . conceived as prior to the actual conditions of human life.” As we happen to live in the actual conditions of human life, we are low-minded enough to ask only for a rule by which we can govern ourselves under these conditions. The lofty mountain-tops are too high for us.

We ought perhaps to give a specimen or two of Professor Birks's reasoning. He tries to retort on utilitarians the charge of deserting the inductive method, and he does it on this wise:—

Utilitarianism, again, is so far inductive, that it refers to experience to decide what things are pleasant or painful, and also in what cases, or to what extent, pleasure may lead to pain, or pain to pleasure. But in its main and fundamental principle, that the rightness or wrongness of actions is to be determined by their tendency to the greatest sum of pleasures, diminished by the smallest amount of pain, and by that alone, it is plainly intuitive first, and then deductive, and deserts the path of induction altogether.

Mr. Birks does not see that the object of the utilitarian theory is not to set up a new test for the presence or absence in actions of a mysterious quality called rightness, but to find out and express in terms fitted to lead to scientific prediction what people really mean when they call actions right or wrong; and this is done by a strictly inductive process—namely, by comparing the kinds of actions which people have in fact called right or wrong at different times and places. This is well brought out in Mr. Fitz-james Stephen's tract which we have already mentioned. Again, Professor Birks quotes the passage in which Mr. Mill seeks to show how virtue comes to be loved for its own sake, though at first desired not as an end but as a means, and illustrates this by the familiar case of the love of money for its own sake. On this Mr. Birks triumphantly asks, Is not the love of money for its own sake a bad thing? And “If the Utilitarian creed be correct, why should not the acquired love of virtue for its own sake, however conceivable as a fact, be equally worthy of blame?” Such a question is almost childish. Of course the answer is that, on the whole, the welfare of mankind is helped by the habit of loving virtue for its own sake, but hindered by that of loving money for its own sake. We pass over lesser blunders, such as the statement that utilitarians define happiness as the summation of “momentary pleasures,” and we do not say that Mr. Birks's remarks on points of detail may not sometimes be right. Still less do we undertake to defend Bentham or Mill against all comers. But we do think they have earned the right to be criticised with competent understanding and decent respect.

It must be allowed that this book contains about three consecutive pages of good sense—namely, Bentham's observations on the principle of sympathy and antipathy, which serve as a text for one of Professor Birks's bitter homilies. We may fitly conclude by quoting from these the paragraph which seems most applicable to Professor Birks himself:—

Another man says that there is an eternal and immutable rule of right; that that rule of right dictates so and so; and then he begins giving you his sentiments upon anything that comes uppermost, and these sentiments, you are to take for granted, are so many branches of the eternal rule of right.

SOCIETY AT MADRID IN THE SEVENTEENTH CENTURY.*

THE Countess d'Aulnoy, hitherto best known, at least to English readers, as the inventor of lively fairy tales, is presented to us in this reprint of her travels in Spain as an equally lively observer; not, however, an observer of the same things that excite the attention and raise the enthusiasm of the modern traveller, for the subject-matter of travels has changed in the last two hundred years, and what a modern authoress would expatiate on in her finest manner excites very little of Mme. d'Aulnoy's attention. But the reader is, in our opinion, no loser by the difference; for men and manners reproduce themselves on paper much more easily than the charm of rocks, mountains, and sunset effects, which make very dull reading in all but a poet's hands. The Pyrenees are with her things to be got over, not described. She misses on their heights the *beaux châteaux* which make the banks of the Loire fairyland; and though she admits that nature in those regions, in spite of its horrors, has “quelque chose de très beau,” she spends much more time in describing the tapestries of a castle, when she does find one, than in noting the particulars of this impression. In fact, eager sight-seer as she is, she finds so little to tell on her way to the capital that she has recourse to imaginary adventures to give interest to her letters. Crossing the Pyrenees in February (1669) was, however, no trifle for a Frenchwoman of the period. It gives us a high idea of her spirit and enterprise. She travels in state with a large attendance and ample means, and everywhere is received with distinguished attentions. What the motive was for such a journey, or whether it had any other motive than to visit a relative of high consideration at Madrid, does not appear. Her style is easy, and entirely free from the formalities which encumber the letters of that noted politician the Princess des Ursins, written from the same capital some five-and-twenty

years later. We do not find her apologising to her friend, “I cannot do myself the honour of dwelling longer on these gloomy topics.” What she laid herself out to describe were the habits and manners of the Spanish Court and great world, which she had every opportunity of observing, for her vivacity, good humour, and knowledge of the world must have made her everywhere a welcome guest. We might also add her tolerance, but probably there was no idea of anything to tolerate in the lofty sphere open to her inspection. She sets down what she hears and sees without the scruples and with none of the circumlocution which would have been indispensable in these days. She sees what is wrong, but her line is rather to note it as a Spanish variety of wrongdoing than from the general moral point of view.

No picture of manners can be more strange than that here presented to us. Most people sin to amuse themselves, but amusement seems with a Spanish grandee of that day scarcely to enter into his calculations. Decorum and etiquette reign, nay tyrannize, everywhere, and religion exacts its tribute in the most unlikely scenes, and from professors the furthest possible from doing it credit. For example, not only was the King's queen compelled on his death to enter a convent, but his mistresses were under the same obligation. In fact a great deal that we read can only be explained by the hold which Moorish manners and ways of thought still had on society and family life. The men had learnt to sit like Christians, but the ladies still sat on the ground, to the infinite inconvenience of their visitor, who made the experiment till she could bear the uneasy position no longer, when her pretty hostess was prevailed upon for the first time in her life to sit on a chair. The separation of the sexes was maintained with almost Mahomedan strictness. On one occasion sixty ladies assembled for a visit of ceremony, “without one poor solitary hat among them,” their attendants being dwarfs. But not the less were their heads entirely full of the subject which it was the great aim of fathers, husbands, and duennas to keep out of sight and thought. On this all their ingenuity and a surprising patience exercised themselves. Mme. d'Aulnoy is constantly struck by their charm of manner and grace of expression, and also by the spirit and constancy with which they conducted love affairs, which were the absorbing interest, the prevailing topic, and almost the only occupation of lives with little else to interest them.

Everything tended to make the life of a Spanish grandee dull and difficult. Nothing but pride and an overpowering idea of consequence, and probably the “pitiable idleness” in which they were trained, could have made men submit to the enormous inconveniences which rank entailed upon them. The higher the rank the more intolerable the trammels of etiquette, till they reached their height in the King's person, whose movements were so ruled by it that custom, quite apart from his wishes, regulated them. On this head our author tells the celebrated story of Philip III. dying of erysipelas because the right nobleman to move the brazier further off could not be found. One of the first things that struck a stranger was the enormous number of useless servants in great houses under the titles of domestics, pages, and gentlemen. When a great man died, if he had a hundred servants, his son was bound to keep them all without diminishing his previous establishment; if his mother died, all her women must be adopted by his wife:—

J'ai été chez la duchesse d'Osone (c'est une très-grande dame). Je demeurai surprise de la quantité de filles et de duennas dont toutes les salles et les chambres étaient pleines. Je lui demandai combien elle en avoit. “Je n'en ai plus que trois cents,” me dit-elle, “mais il y a peu que j'en avais encore cinq cents.”

And with all these hundreds of servants the law did not allow a nobleman to be attended by more than three lackeys, one of whose business it was to walk by the side of the horses that they might not entangle their feet in the long traces, a privilege of rank cherished in proportion to its inconvenience. The sense of distinction and of possession was enough for the grandee; to use and to enjoy what he possessed was a vulgar satisfaction which he left to his inferiors and creditors. Thus he had magnificent carriages which he never used, and astounding services of plate, consisting of hundreds, nay thousands, of dozens of plates and dishes, and was content to dine by himself—being however served by the page on his knees—on two eggs and a pigeon, if indeed these came safe to table; for the servants so pillaged the dishes on the way to table that Mme. d'Aulnoy recommended to her hosts the precaution of the Bishop of Burgos, who had on one occasion presented her with a ragout locked into the dish by the cook, the second key being usually in the keeping of the master of the banquet, though forgotten in this particular instance. It was wholly inconsistent with a great man's dignity to look after his affairs, or to question his agent's accounts, or even to visit an estate that was not colossal. A man or woman of quality, says our author, who was of another temper herself, would rather do than bargain with a shopkeeper or receive change out of a piece of gold. The idea of making the most of their money was intolerable to men whose glory and highest ambition was to sit covered in the presence of the King, and some other equally fantastic privileges and immunities. This indifference to money and to personal luxury is, however, the redeeming point of the character brought before us. Mme. d'Aulnoy, whose *embonpoint*, as seen in her portrait, does justice to the good appetite she owns to, remarks on both men and women being small eaters, which accounts for the excessive thinness of the women, valued by them as a beauty, but far from such in her eyes; as she observes on “cette petite peau noire collée sur des os.” To the Temperance Society every Spaniard

* *La Cour et la Ville de Madrid vers la fin du XVIIe siècle.* Par la Comtesse d'Aulnoy. Édition nouvelle, revue et annotée par Mme. B. Carey. Paris: E. Plon et Co.

of that date ought to be a hero. The national sobriety is always impressing their foreign observer, and the horror of drunkenness was such that to be called a drunkard justified, as it always ensured, assassination.

The women in these spheres were equally victims to the penalties of greatness. We have always heard that the Queen of Spain has no legs, but the saying ought rather to have been that neither she nor any Spanish lady of rank has feet. All the sex's delicacy gathered round this member. The Queen of Philip V. hunting with the King fell from her horse with her foot in the stirrup. Don Alonzo Mariquo, St. Simon tells us, had the address and hardihood to disengage her foot in time to save her life, but, at once remounting his horse, he galloped to the nearest sanctuary, knowing that to touch the Queen's foot was death. Our author, being present at the toilet of a Spanish beauty (to which she remarks, in distinction from France, no men were allowed admittance), observed the lady at one point lock the door, take out the key, and draw the bolts, and, being asked the reason for these precautions, said she knew there were gentlemen in the house, and she would rather die than they should see her feet; which, it is observed, were of the *petitesse* of a child of six or seven. The dress was made so long in front for the purposes of concealment that walking was a difficulty. In fact, except that Mme. d'Aulnoy remarks on the singular grace of their movements—"more flying than walking," "elles serrent leur coude contre leur corps, et vont sans lever les pieds comme lors d'un glisse"—it would seem to have been the aim to prevent women of distinction from walking at all; for the Court dress required them to put on "chapius," a sort of shoe which raised them high from the ground, but which required that the wearer for security's sake should be supported on each side. The restraints to which women were condemned have been the source of thousands of comedies and romances. Our author, relating the arrival of the French bride of Charles II., which happened during her residence in Madrid, writes:—

C'est une chose digne de pitié que le procédé qu'a cette vieille camarera avec elle (la reine). Je sais qu'elle ne souffre pas qu'elle ait un seul cheveu frisé ni qu'elle approche des fenêtres de sa chambre ni qu'elle parle à personne.

And with regard to the natural curl, which was among things forbidden, a touch of barbarism is noted of which there are other indications:—

Elle nous dit que la reine avait été bien plus émue de l'incivilité de la camarera mayor, qui voyant quelques-uns de ses cheveux mal arrangés sur son front, avait craché dans ses mains pour les unir.

It may have been the extraordinary dominion exercised by old ladies which gave rise to a singular habit here recorded, and verified by another authority. The Spanish ladies devoted themselves quite as much to the cares of the toilet as the ladies of any other country, rousing to such an excess that their critic had in one instance seen boiled lobsters less brilliant. Not only the cheek, but the chin, the tips of the ears, the shoulders, and the hands were all tinged; but to these heightened charms they added a pair of spectacles:—

Je demeurai surprise, en entrant chez la princesse de Monteleon, de voir plusieurs dames fort jeunes avec une grande paire de lunettes sur le nez attachées aux oreilles, et ce qui m'étonnait encore davantage, c'est qu'elles ne faisaient rien où des lunettes leur soient nécessaires. Elles causaient et ne les ôtaient point. L'iniquité m'en prit, et j'en demandai la raison à la marquise de la Rosa, avec qui j'ai lié une grande amitié. C'est une jolie personne, qui sait vivre et dont l'esprit est bien tourné; elle est Napolitaine. Elle se prit à rire de ma question et elle me dit que c'était pour la gravité, et qu'on ne les mettait pas par besoin, mais seulement pour attirer du respect. "Voyez-vous cette dame," me dit-elle, en me montrant une qui était assez proche de nous; "je ne crois pas, que depuis dix ans elle ne les ait quittées que pour se coucher." Sans exagération elles mangent avec, et vous rencontrerez dans les rues et dans les compagnies beaucoup de femmes et d'hommes qui ont toujours leurs lunettes.

Passive endurance of inconvenience is a universal trait, down to the cherished dirt, mud, dust, and intolerable nuisances of Madrid—which a German writer said you could smell six leagues round, and any attempt to purify which raised almost a riot. The inhabitants even considered them necessary to health:—

Quand il meurt un cheval, ou quelque autre animal, on le laisse dans la rue où il est, fût-ce devant la porte du palais, et le lendemain il est en poudre. L'on est persuadé que si l'on ne jetait pas ainsi ces ordures dans les rues, la peste ne serait pas longtemps sans être à Madrid, et elle n'y est jamais.

Into the excessive corruption of manners which is often indicated by our author we need not enter. Idle and ignorant, married at sixteen or seventeen, and henceforth freed from all restraint, and never quitting Madrid unless for some great employment for which he was unfit, the Spanish nobleman started in life with no chance. Two passions swayed his life, and furnished at once his business and his recreation. The strange love of blood and horrors, which every memoir of the time dwells on as a national characteristic, mixes itself equally with his amusements, his love, and his religion. Assassinations were not so much a scandal as a duty where honour had been attacked or impugned. The only blood that was willingly spared was that of criminals. The Countess is present at a bull-fight of extraordinary magnificence, where one man is killed on the spot, and two others were mortally wounded:—

Cependant ils disaient tous que la course n'avait pas été fort belle, parce qu'il n'y avait guère eu de sang répandu; que pour une telle fête il y aurait dû avoir au moins dix hommes tués sur la place.

Among the preparations for the marriage of Charles II., whose bride she saw enter in procession, was an *auto da fé*. Whether her curiosity would have led her to assist at it she does not say.

but she gives the ceremonial, as it was reported to her, as a pious and splendid spectacle. The tone quite explains what excites Horace Walpole's wonder in speaking of an insurrection in the Madrid of his day against the ordinance commanding hats to be cocked and cloaks shortened—"A nation that has borne the Inquisition cannot support a cocked hat!" Nobody objected to see a Jew or a Protestant burnt. But her account of the disciplinants in the Holy Week is the strangest in relation to this subject:—

C'est une chose bien désagréable de voir les disciplinants. Le premier que je rencontrai pensa me faire évanouir. Je ne m'attendais pas à ce beau spectacle qui n'est capable que d'effrayer; car enfin figurez-vous un homme qui s'approche si près qu'il vous couvre tout de son sang; c'est là un de leurs tours de galanterie. Il y a des règles pour se donner la discipline de bonne grâce, et les maîtres en enseignent l'art comme on montre à danser et à faire des armes.

Then follows a description of the dress concealing the face, having two great holes at the back, baring the shoulders, with ribbons hanging to the sleeves:—

Ils en mettent aussi un [ruban] à leur discipline; c'est d'ordinaire leur maître se qui les honore de cette faveur. Il faut pour attirer l'admiration publique, ne point gesticuler des bras, mais seulement que ce soit du poignet et de la main; que les coups se donnent sans précipitation, et le sang qui en sort ne doit point gâter leurs habits. Ils se font des écorchures effroyables sur les épaules, d'où coulent deux ruisseaux de sang; ils marchent à pas comptés dans les rues; ils vont devant les fenêtres de leurs maîtres, où ils se fustigent avec une merveilleuse patience. La dame regarde cette jolie scène au travers des jalouses de sa chambre, et par quelque signe elle l'encourage à se courber tout vit, et elle lui fait comprendre le gré qu'elle lui fait de cette sorte de galanterie. Quand ils rencontrent une femme bien faite, ils se fustigent d'une certaine manière, qui fait ruisseler le sang sur elle. C'est là une fort grande honnêteté, et la dame reconnaissante les remercie.

Returning from this extraordinary exercise, the penitent first has his shoulders rubbed with salt and vinegar, and then sits down to supper with his friends, each one assuring him that in the memory of man no one had given himself the discipline with such grace. "Do not think," she concludes, "that I embellish my story to amuse you; it is all true to the letter, and any one who has been at Madrid will tell you the same." We conclude for want of space, though we could willingly have given some good stories and dwelt longer on her estimate of character and on the good qualities which, in spite of these grave faults and strange eccentricities, engaged Mme. d'Aulnoy's admiration and sympathy. She evidently liked the Spaniards—men and women—with whom she associated, and was liked by them.

MISS WORDSWORTH'S TOUR IN SCOTLAND.*

IN the year 1803 Wordsworth, who had then been settled at Grasmere for some time, made a tour with his sister in Scotland. Miss Wordsworth kept a journal, some fragments of which were prefixed to the poems suggested to her brother during the tour. Principal Shairp, who edits the journal now for the first time published entire, is of opinion that lovers of Wordsworth's poetry will have learnt these sentences by heart. Though we feel the danger of the avowal, we must confess that the test thus suggested is rather too stringent. We hope that it is possible to be a very sincere lover of Wordsworth and yet not to be blessed with so retentive a memory. Miss Wordsworth's journal, however, is not only very excellent in itself, but is interesting as an illustration of her brother's poetry. We have been rather spoilt of late years by many descriptions of scenery pitched in a much higher key than that journal. Every scribbler thinks it right to be in an ecstasy on the sight of a mountain; and, if we were confiding enough to take their own words for it, we should suppose that modern tourists are incomparably more sensitive than their grandfathers. Yet people who have had an opportunity of watching the tourist on the spot, and of afterwards reading his descriptions, are inclined to be slightly sceptical. To all outward appearance, a gentleman has passed his half-hour or so on the top of a hill in grumbling at the quality of the luncheon supplied by the last hotel; and has at most shown due homage to the view by getting up a smart geographical controversy with his companions. When he comes home and puts his remarks on paper, we find that underneath this frigid exterior he ought to have been filled with poetic rapture; and perhaps it is not uncharitable to suppose that some of the rapture was concocted in cold blood. Even where there is genuine feeling, few people dare to express themselves naturally. Nobody can doubt, for example, Mr. Ruskin's intense enjoyment and delicate appreciation of high mountain scenery; and yet in some of his really eloquent passages we feel that there is a little too much self-consciousness and foregone determination to be striking. In Miss Wordsworth's journal there is a complete absence of any such questionable ornament. She is writing down her impressions as faithfully and briefly as she can. If she happens to think a mountain view ugly, she says so in plain terms without having the fear of guide-books before her eyes. So little had been said about Highland scenery in 1803—two years, that is, before the appearance of the *Lay of the Last Minstrel*—that as yet there was no temptation to hypocrisy. No tyrannous public opinion had marked out the particular spots where you were to shed tears, and the others where you were to be annoyed by some evidence of bad taste. When an expression of delight in the scenery comes we feel that it is absolutely sincere, and are moved to sympathy ac-

* *Recollections of a Tour made in Scotland, A.D. 1803.* By Dorothy Wordsworth. Edited by J. C. Shairp, LL.D. Edinburgh: Edmonston & Donald. 1874.

cordingly. At the same time we perceive that the descriptions, though very plain in expression, are made with something of a purpose. In some cases they are brief notes of scenery and impressions which Wordsworth afterwards turned into poetry. But even where they have not actually been turned to account in this way, we can see the marks of the habitual practice. As a painter jots down rough memoranda in a sketch-book which may give him hints for future composition, Miss Wordsworth is always accumulating possible suggestions for her brother's work. The intention may not be consciously entertained at every moment, but the habit has been acquired with a view to such purposes. The result is to impress a peculiar character upon the journal. As Principal Shairp says, there is very little fine writing; but those parts are selected for notice which would tell in poetry. We constantly come upon little vignettes of scenery or brief anecdotes of character which might have served as a text-book for characteristic poems. Frequently the material has been used, and the editor has given in an appendix the poetry which was suggested by the prose. Elsewhere we must fancy for ourselves what would have been the treatment. A quotation or two may best illustrate the character of these notes for poems. Here, for example, is a passage which suggested a well-known poem:—

The sun had been set for some time, when, being within a quarter of a mile of the ferryman's hut, our path having led us close to the shore of the calm lake, we met two neatly-dressed women, without hats, who had probably been taking their Sunday evening's walk. One then said to us, in a friendly, soft tone of voice, "What, you are stepping Westward?" I cannot describe how affecting this simple expression was in that remote place, with the Western sky in front yet glowing with the departed sun.

And here is another evening scene, which has not been put into verse, though it dimly recalls a number of passages in Wordsworth's poetry which are almost identical in sentiment:—

At that time of the evening when, by looking steadily, we could discover a few pale stars in the sky, we saw upon an eminence, the bound of our horizon, though very near to us, facing the bright yellow clouds of the West, a group of figures that made us feel how much we wanted in not being painters. Two herdsmen, with a dog beside them, were sitting on the hill, overlooking a herd of cattle scattered over a large meadow by the river-side. Their forms, looked at through the fading light, and backed by the bright West, were exceedingly distinct, a beautiful picture in the quiet of a Sabbath evening, exciting thoughts and images of almost patriarchal simplicity and grace.

We need not inquire whether, as the editor thinks, these and other passages in Miss Wordsworth's writings indicate original powers which might have fitted her to take an independent place in literature. Sometimes the poetic version adds but very little to her plainer prose, but it must be also remembered that in that very little often lies the whole indefinable charm of poetic treatment. In one particular case where the brother puts into verse a sentiment common to the two we cannot affect to admire the result very warmly. When at Dumfries they heard some remarks about the temptations to which the sons of Burns were exposed, Wordsworth gave them excellent advice in some stanzas, one of which we may quote, as our readers are not likely to know it by heart. He tells them to be watchful:—

For honest men delight will take
To spare your failings for his sake,
Will flatter you, and fool and rake
Your steps pursue;
And of your father's name will make
A snare for you.

The question which these verses suggest is whether it would be better to be sober and never do anything better, or to drink and write some of Burns's lyrics. Luckily Wordsworth could rise into loftier regions; and his sister's journal is full of suggestions for his most characteristic vein of thought. The homely life of the Scotch peasantry, and the noble scenery of their hills, are touched with equal tenderness of feeling. Miss Wordsworth's taste in mountains is a little coloured by her natural prejudice in favour of the English lakes. The editor indeed says, in his pleasant introduction to the journal, that the Wordsworths did not look upon the Scotch hills with a sense of rivalry, but of brotherhood; and he adds that they were free from the vulgar habit of comparing. It is creditable to his freedom from Scotch prejudice that he should take this view. There is only one place in which his patriotism is a little too much for him, and that is where Miss Wordsworth innocently remarks that the herrings of Loch Fyne are superior to "those which we got in the North of England." "I should rather think so" is the indignant comment excited by the bare suggestion that some possible scale of comparison could be arranged with whatever advantage to the Scotch commodity. There are, however, a good many comparisons between English and Scotch scenery, not of course according to the vulgar fashion of the modern tourist, who likes to have mountain peaks arranged in precise order of merit. And we must add that, as a rule, Miss Wordsworth inclines to assert the superiority of the English scenery more frequently than we should have expected. She seems to have been more struck than a modern tourist would think right by a painful sense of the savage and barren character of the Scotch hills. Neither Wordsworth nor his sister took the misanthropic or Byronic view of scenery; they liked to see the smoke of a cottage chimney, or a flock of sheep, or a cluster of trees round a farmhouse in the foreground of their landscapes. Nor is it to be forgotten that Scotch travelling was then a very different thing from what it is now; and that the hardships to be endured were sufficient to be really trying to the health. Miss Wordsworth seems to have been a very good traveller; but Coleridge, who had rashly joined them,

apparently had enough of roughing it after a visit to the Trossachs, and deserted his over-hardy companions. The tourists who this autumn visits Loch Katrine, Inverary, Loch Awe, or the pass of Killiecrankie, may add to his comforts by taking this volume with him and comparing his luxurious hotels with the smoky huts and taverns in which the Wordsworths had frequently to take refuge. When he compares the bill presented to him with such charges as seven and sixpence for a day's board and lodging for brother and sister, with a horse and carriage, he will perhaps reflect that there are two sides to the question. It is, however, worth remarking that the tide of tourists had already set in, though Scott's poetry had not yet increased the returns of duty on post-horses. Principal Shairp quotes two or three publications which show that the Trossachs in particular were beginning to attract notice about the year 1790; and, in more accessible places, we find from Miss Wordsworth's journal that the tourist was already a recognized variety of the human species, and that Scotch innkeepers were learning how to turn him to account. Indeed we are generally accustomed to assign too modern a date to the recent taste for mountain scenery. The Alps had already attracted a large number of tourists during the generation which intervened between the Seven Years' War and the French Revolution. When English travellers were confined to their own island by the outburst of the new war, the Scotch mountains naturally received a greater share of attention, and it is probable that the Trossachs would have been soon advertised by some innkeeper even if the *Lady of the Lake* had never been written. Few travellers, however, either at that period or at any later time have enjoyed that favourite spot more keenly than the Wordsworths, who visited it twice and found it difficult to express their warm admiration.

We may add one trifling remark. The Wordsworths are surprised by hearing a Scotchman call the weather "gay and dull," and by other similar usages. Principal Shairp explains that "this is none other than the well-known Scotch word 'gay'—indifferently, tolerable, considerable." He is of course quite right, but it strikes us as odd that the Wordsworths should not have recognized it, inasmuch as we have constantly heard it used in precisely the same sense in the English Lake district. It would be easy to make a plausible argument showing how this inattention is characteristic of Wordsworth as compared, for example, with Scott, who could never have missed such a phrase. But we leave the task to our readers.

* HUNT'S SCHOOL HISTORY OF ITALY.*

ON glancing over this compact little History of Italy, which forms one of the series of school-books now appearing under Mr. Freeman's editorship, one cannot but reflect how happily, speaking from a purely literary point of view, the course of modern Italian politics has run. It is not so long since the history of Italy was a melancholy tale of freedom lost for lack of knowledge how to use or keep it, of a people with noble gifts crushed and degraded under the yoke of priests, despots, and aliens, and the chronicler could speak of unity and freedom only as matter for patriotic dreams. Had our historian written only just before the late war, he might indeed have spoken in tones of triumph of what had already been done, and of hope for what yet remained to be done, but his story would still have been like a novel with the third volume lost. The hero would still have been seeking the heroine who was to reward his labours; the King of Italy would still have been outside the gates of Rome. As it is, the author is enabled to drop the curtain on a dramatic *dénouement*, leaving Rome, shorn indeed of her somewhat hollow grandeur as the capital of the world, but rejoicing in the truer, if more modest, dignity of being "the seat of a liberal and enlightened Government, the head of free and united Italy." We have only quoted a few words, but they are enough to show that Mr. Hunt goes heartily along with the Italian King and people, and that consequently, wherever his work may be adopted as a text-book, it will not be where Archbishop Manning has influence. The Italian Government, on the other hand, might find it to their advantage to have it translated into their own tongue, and used in all the schools of the country, so well does it tell the tale of the triumph of the Liberal cause and the accomplishment of Italian unity. It is not often that contemporary history is made clear and even interesting in a short compass, but this feat the author has performed, showing himself able to do justice alike to the brilliant achievements of Garibaldi, and to the less romantic but more statesmanlike work of Cavour. No theological animosity is displayed, nor indeed are religious questions, as such, entered upon at all. But it is impossible to tell the history even of quarrels long gone by, of the strife of St. Anselm and William Rufus, of St. Thomas and Henry II., much more that of Pius IX. and Victor Emmanuel, without hurting somebody's religious or political feelings; and the most conscientious attempt to be impartial inevitably ends in giving the advantage to the secular side of the dispute. Mr. Hunt is able to dwell upon the mysterious, half-religious reverence with which men of the age of Dante regarded the Emperor, because the Empire and all the lofty visions connected with it are gone for ever; but he cannot bring out so clearly the well nigh divine position which the Pope still holds in the minds of many, because the question is too "burning" a one to be handled with safety. There is perhaps

* *Historical Course for Schools. History of Italy.* By William Hunt, M.A., Vicar of Congresbury, Somerset. London: Macmillan & Co. 1874.

something almost *naïf* in his remark that "Pope Pius, by uttering curses and complaints against the policy of the King and his Government, has made it difficult for the King's Ministers to deal with him on those terms of cordial respect which they would wish to observe." In the ears of one of the faithful this must sound much as if Robin Hood and Little John had represented that the Bishop of Hereford, by uttering curses and complaints against them for abstracting three hundred pounds from his "portmantua," had made it difficult for them to deal with him on those terms of cordial respect which they would have wished to observe. And we may be sure that no Roman Catholic instructor in this country will consent to let his pupils hear, in place of pathetic rhapsodies about the "prisoner of the Vatican," the simple and unromantic facts that the Pope's "personal comfort and dignity were carefully considered by the King," that "he was even allowed to keep his guards, and an ample income was secured to him." As for the statement that "the loss of Rome and of all temporal dominions in no way changed the spiritual title and power of the Pope," the Ultramontane reader may perhaps retort that, if by spiritual power is meant the ability to consign one man to heaven and another to hell, the information is unnecessary; for this power, if it exists at all, would remain the same whether the King of Italy were to throw the Pope to the lions, or himself to come a bare-footed penitent to the door of the Vatican. Those who are not Ultramontanes will probably, like ourselves, be well content with Mr. Hunt's account, and wish for no alteration, save that the time may come when the last section, "Italy since 1870," will have to be re-written, and when "the work of regenerating a country which has suffered more than any other from a long bondage, both mental and physical," will be spoken of, not as a difficult task still to be completed, but as an accomplished fact.

When we turn to past times, the interest of the narrative is less, though not altogether by the fault of the author. There is no leading idea, such as that of Italian unity, to connect the narrative, which of necessity skips to and fro among the various States—Rome, Florence, Milan, and so forth; and the charm of character or of picturesque detail is denied by the stern requirements of brevity. Mr. Hunt's epitome has a great deal of information crowded within its narrow limits, and is throughout the work of one who has a firm grasp of his subject, and an interest in and love for the country whose history he writes; he has arranged his materials well, and wound his way skilfully through the maze of Popes, Emperors, Kings, Grand Dukes, Republics, tyrants, and what not. The name of the editor alone would be enough to guarantee the careful bringing out and explanation of one complicated and puzzling subject—the relations between Italy and the Emperor. Nothing can be plainer than the following account of the position of the German potentate who was also rightful sovereign of Italy:—

The crown of the Italian kingdom or of Lombardy, and that of the Empire, which latter brought with it rights over Rome and the Lombard Duchies, were now again worn by a German King; and from this time the belief began to grow that he who was chosen King by the Germans had a right to be crowned King of Italy at Milan and Emperor at Rome. The coronation of Otto was a great revival of the Empire, for the Italian Emperors had been no more than Kings of part of Italy with a high-sounding, but in their case a meaningless, title. But from that time the great armies of the German Kings made the title of Augustus again venerable. If the Imperial dignity had remained in the hands of Italian Princes, it would certainly have lacked the vast and splendid theories which clustered round it, but possibly the Italian King, aided by so great a name, might have formed a free and united Italy. As it was, the Empire gained in strength by being joined to a great power like Germany; but as the German King thus became rightful Emperor and King of Italy, it thus strangely happened that the lawful Sovereign of the land was of another nation.

Kings of the Romans, Emperors-elect, and Emperors, all receive their proper titles in this volume, instead of being, as usual, jumbled together under the misleading name of Emperors of Germany; and the Emperor of Austria—a potentate whose title is a sufficient crime to make him odious in the eyes of the champions of the Holy Roman Empire—is not allowed a chance of decking himself in the plumes of the successor of Augustus. The Empire, says Mr. Hunt, "consciously and decidedly," "was founded by Augustus, it was renewed by Charles the Great, it was restored by Otto, and it came to an end by the abdication of Francis II." We doubt, however, whether clearness is gained by refusing to allow Francis the title which he gave himself, and putting him off with that of "Austrian Emperor," which might equally well denote a Roman Emperor of Austrian birth. However, *Cæsar*—meaning the genuine *Cæsar*, and no Austrian or Corsican counterfeit—certainly has here all that is his rendered unto him, and perhaps a little more respect than is due to one of the many forms assumed by that curse of the world, the Grand Regulator who is to put everything right. Mr. Hunt truly remarks of the Italians of the age of Dante, "The study of the literature and the law of Rome in early days strongly implanted in men's minds reverence for the Emperor, a feeling often to be disappointed, and at last crushed by a nearer acquaintance with the bearer of this mighty title." That is to say, the Empire was a chimera, and required the enchanting effects of distance to make any one take it for a reality. The relations between the spiritual and the temporal Head of Christendom are equally well treated, and indeed almost all the political parts of the book are excellent, though, as a matter of language, we protest against being told that the Pope's "position as a temporal prince made his existence as much a given point in Italian politics as the existence of a king in Naples." This piece of modern jargon will probably sound as

mysterious to the youthful student as Mazzini's assertion that Rome—we quote Mr. Hunt's version of his words—represented "the eternal gospel of oneness to the people." Like epitomes in general, the book as a whole fails to be entertaining, although now and then the narrative becomes interesting, and sometimes even spirited. Besides the modern parts, of which we have already spoken, some of the incidents of Florentine history, particularly the conspiracy of the Pazzi, the ordeal and death of Savonarola, the siege and fall of Florence, and the death of her gallant defender Francesco Ferruccio, are among the best told in the book. The famous interview of the dying Bayard and the traitor Bourbon is given simply and impressively; but it might be asked why, when there was so little room to spare, the author chose to commemorate a scene between two Frenchmen, which might fairly have been left to French history, and did not rather devote the space to some incident more properly belonging to the Italians. In speaking of the havoc made among the French nobles and captains at Pavia, he gives a line to the memory of an Englishman who perished with them—Richard de la Pole, whom he erroneously describes as "grandson of our George Duke of Clarence." Here there has evidently been a confusion between the De la Poles who were nephews of Clarence, and the Poles who were his grandsons. The sections on miscellaneous subjects, such as the arts, are good, and architecture in particular is treated at more length, and in a more appreciative and interesting fashion, than is usual in a book of this class. The characteristics of the great schools of painting are well given in few words, although a slip has been made in describing the Cartoons of Raffaele as "designs from the Acts of the Apostles"—a description at least inadequate, seeing that the Miraculous Draught of Fishes and the Charge to St. Peter are both subjects taken from the Gospels. Mr. Hunt traces the fortunes of the Cartoons from Flanders to Hampton Court—perhaps, to be quite up with the march of modern events, it should have been added that they have now found their way to South Kensington—and he duly records Cromwell's good deed in saving them for England. Literature is rather capriciously treated. There is much about Dante, but Ariosto is only mentioned as a poet who wrote in Italian instead of in Latin, and Bojardo and Tasso are not so much as named, although Manzoni, by virtue of being a Liberal and writing with a political motive, gets a comparatively long notice.

The chief fault of the book is its frequent carelessness of style. Mr. Hunt writes in a calm and quiet tone, and avoids long words, but his language is often poor and awkward, and sometimes obscure. The iteration of "very," "great," and "but," three favourite words with this author, is vexatious both to ear and eye. "A great number were enlisted at Venice, both of those who had fled from the tyrant's cruelty, and many citizens of the Republic, which was endangered by Eccelino's great power." "But the Guellic party chose Otto, the son of Henry the Lion, who had been Duke of Saxony and Bavaria, but who had lost a great part of his dominions." When the Duke of Wellington put four *ands* into one paragraph, Cobbett remarked, "Never was this poor conjunction so worked before, except, perhaps, in some narrative of a little girl to her mother." Here, however, the conjunction *but* is worse treated, for it does duty seven times in one page. As for reckless employment of pronouns, take the following sentence:—"The armies of the Italian cities were no longer composed simply of citizens, for the different lords chose rather to hire heavy-armed cavalry, who were entirely dependent upon *themselves*, than to trust arms to *their* subjects which might be used to regain *their* freedom." Taking another sentence, we read:—"The cruelty, lust, and avarice of the conquerors brought very great evils upon the cities of South Italy, which were enriched by commerce, and offered *them* a tempting bait. *They* called the Emperor Lewis to help them, and he undertook the siege of Bari." It is only by attention to the statements which precede and follow that the reader can discover that the Emperor came to the aid of the afflicted cities, and was not, as the grammar implies, called in by the Saracen conquerors to lend a hand in the plundering. Then we are told:—"King Lewis and Ludovico both offered to help the Florentines against the Pisans, but *they* could not but remember that both parties had been the cause of their having lost the city in the first place, and *they* stood neutral." After reading this sentence over with the utmost attention, we are still in the dark as to who could not but remember, who stood neutral, and who "both parties" were. It is the more pity that there should be such blemishes as these, because Mr. Hunt can and often does write well, and because the matter is so good that it would have been worth the author's while to have bestowed some pains in making the manner more worthy of it. The very passage which is so thickly studded with *buts* contains an excellent account and comparison of the Italian and French systems of warfare in the fifteenth century, and might with little trouble have been made a readable piece of composition. A school-book, of all books in the world, ought not to contain sentences which would scarcely pass muster in a schoolchild's exercise. However, setting aside these faults of style, Mr. Hunt's work will no doubt be found of much use. The art, and to a certain extent the literature, of Italy are familiar subjects, but her political history is little known or understood by ordinary English people; and this book cannot fail to be welcome to many who wish to learn something of the fortunes of the land which in our own days has risen from a geographical division into a living nation. We will conclude with the suggestion that a chronological list of the Popes and Emperors should be added in

the next edition. This would be a great help to the reader, who at present is liable to be confused by the rapid succession of the spiritual potentates—sometimes two of them at once—and the passing and re-passing of Cæsars across the scene.

LONGEVITY.*

THE case of the Tring centenarian, Betsy Leatherland, as lately stated in the *Times*, is only another proof of the ascertained fact that human life in these days may occasionally exceed the centenary barrier supposed by some to be its *ne plus ultra*. Betsy Leatherland is said to have been baptized on the 24th of April, 1763, at Olinnor, Oxon; married twenty-two years later at St. James's, Dover; left a widow in 1816 at Carrick-on-Shannon; and to be now living in her 111th year under the roof of friends at Tring, occupied during the winter with net-making, and in the harvest-tide toiling in the wake of the reapers. It appears from Mr. Piggott's letter to the *Times* that the few facts of her long life with their dates and vouchers are forthcoming in their order and sequence, though they could hardly escape the ordeal of Mr. Thoms's scrutiny, especially as Mrs. Leatherland's years have so exceptionally overleaped the barrier; but the real interest of this and similar cases—which are now too numerous established to admit of a wholesale negative—is not so much in the bare fact that human life is sometimes prolonged beyond a given limit, as in the help they offer towards the discovery of the causes conducive to such prolongation. If we accept the plausible calculation of Flourens that natural life is capable of extension to five times the period of growth, and if maturity is a variable quantity ranging from eighteen to twenty-one years, it follows that man's life is capable of reaching to ninety or from that to a hundred and five years. Whether much would be gained to the world by the frequency of such an exceptional prolongation of life is perhaps as questionable as the advantage of it to the persons themselves, who, we are told, are mostly loud in professing their readiness to depart. But not the less is it desirable, both on public and private grounds, to ascertain how far the effects of age can be mitigated or retarded, and to discover what conditions make for longevity or the contrary. The belief is common that the term of human life has increased in England and in other countries during the present century, and it is not impossible that it may be susceptible of greater and more general increase. In satisfaction of a natural and widely-spread curiosity on this subject, we have to offer a few crumbs of information and inference picked out of the most recent literature of longevity—namely, a volume by Dr. John Gardner, on the *Means of Prolonging Life after Middle Age*, which has just reached a second edition, and a paper read by Sir George Duncan Gibb, before the Anthropological Institute, on the Physical Condition of Centenarians. In many points the two writers will be found to agree, and the design of the one to examine the physical troubles incidental to advanced age with a view to their mitigation or avoidance is supplemented by the observations of the other with reference to a given number of examples of healthy and vigorous longevity.

An eminent physician once went so far as to maintain in his anatomical lectures that, "as far as he could observe, the human body, as a machine, was perfect; that it bore within it no marks by which we could predict its decay; that it was apparently calculated to go on for ever, and that we learned only by experience that it would not do so." Whether from enthusiasm in their subject, or from a confidence strengthened by research and inquiry, this belief is but a somewhat strong expression of that of many medical men. Dr. Gardner, for instance, seems by no means to despair of the eventual discovery of an "elixir vite," and argues for its probability from the analogy of anaesthetics, so long deemed visionary, but now so largely multiplied and so generally accepted. We cannot follow him into the consideration of the specific medicines derived from the vegetable kingdom or found among the products of the chemical laboratory, which he anticipates will at no distant period be found to arrest the ravages of time on the human constitution. One of these is a vegetable remedy known by the name of Podophyllin, on which he relies to relieve the gouty constitution from its pervading poison. It is a resinous extract from the rhizomes of a herb of the Ranunculaceæ order, much used by American practitioners as a substitute for mercurials, and recommended to European use as entirely innocuous. Another on which Dr. Gardner sets great store is a patent medicine, in which the chief ingredient is the winter cherry (*Physalis Alkekengi*), said to be very useful as a diuretic, and reputed to be of decisive efficacy against gout. In like manner, "mullein" (*Thapsus verbascum*) is commended in cases of bronchitis, and "digitalis" or preferably "veratrum viride" (another importation from America), for rheumatism in the region of the heart. But the only part of the advice as to these remedies which we should venture unreservedly to endorse is the caution not to dabble in any of them except under the direction of a trustworthy medical practitioner. Indeed we should be disposed to look for typical cases of longevity amongst persons less artificially kept alive than

by such a course of corrective and restorative medicines. Possibly the French writer who said "Men don't usually die, they kill themselves," may have allowed a fair margin for those who killed themselves by physic. We are much more inclined to go along with Dr. Gardner in attaching efficacy in retarding the inroads of old age to (1) mental tranquillity; (2) moderate sobriety; (3) warmth and good temperature. Fretting and fuming will wear out the best-constructed human machine; yet it is easier to prescribe than to practise on one's pillow "a determined direction of the thoughts to some subject as remote as possible from the ordinary and habitual currents, or one which can be entertained without the least admixture of emotions of a disagreeable kind" (p. 138). Nor indeed is it a great encouragement to the earnest seeker after the "elixir vite" who has secured a livelihood, but not a retiring pension, at threescore, to be told that rest ought to come at sixty at the latest. That a moderate use of wine is beneficial in advanced age, and that it, as well as the diet, should be regulated with a reference to former habits, is a position which needs no argument to support it. Light and frequent meals, due attention to clothing and ventilation, and moderate habitual exercise, must needs tend to secure the physical system against sudden disorder or the incidence of fatal interruption of functions. As Dr. Gardner sums it up:—

A tranquil mind, well-selected diet, moderation in the use of wine and other stimulants, exercise short of fatigue in favourable states of the weather, confinement to a warm house in cold and wet weather, well warmed and ventilated sleeping apartments, clothing adapted to the seasons, maintenance of the annual heat of the body, particularly of the lower extremities, careful avoidance of external influences tending to produce disease, malaria, and the like; judicious bathing, to secure a healthy skin—these are the principal points claiming the attention of aged persons, even when enjoying the best health.

Now these are just the points upon which Sir Duncan Gibb's personal examination of six ultra-centenarians, two of them male and four female, especially bears. It would seem that each and all of them were born with a capacity for long life, and, through favourable circumstances, conditions, and accidents, cultivated and did not impair that capacity. Luning, one of the men, a Hanoverian naturalized in England, died at Morden College, Blackheath, in 1870, at the age of 103, and is one of the admitted centenarians of Mr. Thoms's narrow list. The other, Eldritch, was alive and hearty, though just beginning to fail in intelligence, in 1872, at the age of 104. Sir D. Gibb, in comparing the two, observes:—"Luning had the appearance of one of the oldest men I ever saw, and just such as I could fancy in a person of his age; but it was completely eclipsed by that of Eldritch, who was a veritable patriarch, with locks of silvery grey hair reaching to his shoulders, and a beard of similar colour." His face wore a remarkably sweet expression, and there was no mistaking his great age. But the facts which came out most prominently in this examination were that in the case both of the males and females there was perfect integrity of the lungs and heart, especially of the former, perfect respiration and regular chest-expansion, and also, in four out of the six cases, good "bellows-power," to judge from the firmness and sonorous clearness of the voice, and the measured breathing during conversation. The epiglottis, or cartilage at the top of the windpipe, was in each vertical, as in its natural state, and not pendent, so ensuring the freest admission of air through the openness of the upper part of the larynx. The appearance of the countenance in all is described as a sort of silvery expression with great toughness of skin. The action of the heart in each was moderate and quiet, but not feeble, that organ itself being in no case enlarged or fatty. What is still more to the point, all had perfect digestion, and all a perfect composure of mind. In almost every particular the special senses—sight, smell, &c.—and the mental faculties were unimpaired; and as to condition of mind and body there was an absence of those changes which Dr. Gardner and Sir D. Gibb agree in looking for in persons approaching the allotted period of threescore years and ten.

Dr. Gardner, it would seem, attaches much importance to a keen watching of the human framework, as it approaches the grand climacteric of sixty-three years, with a view to the timely "stitch in time"; and has his own special correctives and preservatives to suggest. There is doubtless much truth in his remarks upon the effects of impure water in hastening premature decay, and we observe that Sir Duncan Gibb coincides with him in the opinion that the question of climate is unimportant as regards the attainment of longevity. As to travelling, he arrives at the prudent and comfortable conclusion that "the majority of persons who have passed the line of demarcation between adult and old age would do best by making judicious arrangements at home for warmth, pleasing occupation, exercise, and diet." Doubtless, also, food and regimen have a great deal to do with length of years, and here, rather than in medical nostrums, is the true use of a professional advisor. What to eat, drink, and avoid are questions oftener solved in theory than in practice. And it is only approximately that such typical longevitarians as Sir Duncan Gibb's little band can assist us in this matter, inasmuch as they seem to have been born to live long, and must have come into the world with a manifest predisposition that way. It would not do, of course, to indulge in raw cucumber, gooseberries, and the like up to the age of a hundred because Miss Wallace did so with impunity, even if it were safe to imitate her seven meals in the twenty-four hours. But it is safe to infer that frequent and moderate meals are better than to combine the extremes of fasting and gorging, after the

The Physical Condition of Centenarians. By Sir G. Duncan Gibb, M.A., &c. *Journal of Anthropological Institute.* Vol. II. No. 1. London: Trübner & Co.

manner of persons who bring upon themselves what Dr. Marshall Hall used to call the "temper disease" by total abstinence from food between breakfast and dinner. Perfect composure of mind can no more consist with such a trial to the morale of the best-tempered human being than perfect digestion. Thus much, however, is established in the examples cited by Sir D. Gibb, that in all the diet was simple and plain, and that the habits of all were temperate. If, as in the case of five out of the six, the teeth were quite equal to their office, and in one of the five as good as new, this may be an argument for taking more care in youth of those important functionaries, which exercise so vast an influence over health and digestion. On the whole, perhaps, we should be safer in accepting Sir D. Gibb's conclusion, that to reach the age of a hundred requires a naturally healthy constitution and an unimpeded performance of the great vital functions, than in believing with Dr. Gardner in the possibility of arresting decay with such precision as to prolong life to an extent yet unrealized. The former writer so far agrees with the latter as to believe that simplicity of regimen and avoidance of starch of potato, malt liquor, and cheese, which in their assimilation lead to changes in the bloodvessels that close life at the ordinary period, may ward off the predominance of an element most antagonistic to longevity; but he stops short of the proposal of Dr. Gardner to submit the whole question to public experiment, and to test the capacity for long life of a dozen men and a dozen women in a kind of Prytæneum, where they are to be subjected to treatment specially calculated to promote longevity. "Let them," writes this fond enthusiast, "be placed under careful and strict supervision: protected against all known external agencies capable of causing disease; supplied with clothing, allowed exercise, and a table furnished with every necessary and wholesome food." It must be added that these two dozen centenarians *in posse* are to be selected from "among the inmates of Unions," and this after ascertaining the history and antecedents of themselves and their ancestors, with a view to eliminating any element of hereditary disease. Further, they are to be instructed as to the aim and object of their being thus gathered into a sort of college of health, and lectured on the enormity of waywardness and indocility. But, to say nothing of the difficulties of making a satisfactory selection—especially out of the average workhouse—is not this notable plan fraught with failure in its minor details? Betsy Leatherland has, we are told, reached her 111 years by having led from youth to age more or less the gipsy life to which she was born. Sir D. Gibb's centenarians, for the most part, have their old age cheered by the care and kindness of descendants, perhaps in two or three generations. It is one secret of long life to live, when old, with the young. Lonely old age realizes the adage, "Obit anus, abit onus." But such a race for long life as Dr. Gardner suggests would break down through sheer weariness. To say nothing of the intolerable constraint and tedium, and the sense of being cooped and fatted for a purpose, at least a third of the twelve would be pretty sure to die of the prosings in the chimney corner. Perhaps, in any case, it is just as well that such schemes are likely to be abortive, for an increase of centenarianism might sadly disarrange the existing order of succession, and complicate, by overcrowding, the struggle for life.

MANUALS OF LITERATURE.*

IT is said that Mme. Necker, having convinced herself that everything could be learned by profound study, set to work to acquire the art of conversation by rule. Of course she failed utterly in her attempt. Now, though there are few people who would not at once smile at the idea of talking well by rule, there are a great many who apply Mme. Necker's principle to the art of talking on paper, and who imagine that in order to become a good writer one has nothing to do but to study an English grammar and to learn by rote certain rules which they look upon as the laws of composition. Mr. Minto clearly belongs to this class of persons. In the introduction to his *Manual of English Prose Literature* he offers to students of the English language many pages of rules for the formation of style, and talks a great deal about the "elements of style" and the "qualities of style" and the "elegances of style." Indeed he gives so many directions as to the way in which everything must be said, that we feel sure any unfortunate being who tried to remember them all would be certain to forget, by the time he got to the end of them, what it was that he meant to say.

Mr. Minto seems to think that the great secret of success in literature lies in imitating the style of somebody else. He therefore sets to work after the fashion of children who, having got a speaking doll or a running mouse, or any other new and curious toy which they long to imitate, pull it to pieces to see how it is made, and find to their sorrow that seeing how it is made is very different from being able to make it. Mr. Minto, when he finds a piece of writing of unusual beauty, pulls it to pieces too, or analyses it, as he calls it, and then expects his students to produce something as good or better; for Mr. Minto always finds something to amend in the style of the best authors. In some respects this "Manual" differs from

the many other "Manuals of English Literature" which are published year by year without effecting that marked improvement in the style of written English which they all declare to be the aim of their existence. Mr. Minto deals with prose-writers alone; but, before entering on the consideration of prose-writers of an earlier date, he devotes a third part of his book to the examination of the merits and claims to admiration of the three men whom he looks upon as the greatest among the prose-writers of the nineteenth century. These three are De Quincey, Macaulay, and Carlyle. Of the first and of the last of these Mr. Minto is enthusiastic in admiration. To be sure he does say that the works of De Quincey are only a profitable study to the student who knows what to imitate and what to avoid. But surely the student who knows so much has got beyond the stage at which copying any one's style can be of use. Whatever the merits of Mr. Carlyle's style may be, it certainly cannot be recommended as "Standard English"; but this Mr. Minto has not yet found out. With Lord Macaulay he has much fault to find, and he takes the liberty of altering several of his sentences and paragraphs, and, as might have been expected, he alters them in every instance very much for the worse. Mr. Minto's power of appreciating Lord Macaulay may be best judged of from his telling us with solemn gravity that Lord Macaulay "kept up an acquaintance with such books as the *Pilgrim's Progress*, *Gulliver's Travels*, and the *Arabian Nights Entertainments*, chiefly for the purpose of drawing upon them for ornamental illustrations." Has Mr. Minto no faith in human memory? Has he himself contrived to sweep clean out of his head all the fairy tales and funny rhymes that first taught him what the world was like beyond the four walls of his nursery? or does he think that every man who by chance may quote these friends of his childhood keeps a small library of picture-books for private study? As for one of the books from which Lord Macaulay is thus supposed to have read daily lessons, Mr. Minto is as blind to its beauties as he is to those of Lord Macaulay's own style. We mean the *Pilgrim's Progress*, the book which perhaps has had the longest spell of popular favour of any book in the language, which has triumphed over all prejudices of social, political, and religious sects, and which still has a fascination for readers of all ages and of every class. In Mr. Minto's opinion this famous book has been vastly overrated. He tells us, somewhat to our amazement, that although Bunyan's "language is homely, it is not the language of everyday life, but rather that of the Church, of the Bible, of Foxe's *Book of Martyrs*." Does Mr. Minto really think that the translators of the Authorized Version and the author of the *Book of Martyrs*, books which were specially designed to gain a hold upon the people, set to work to invent a language as unlike the "vulgar tongue" of their day as Mr. Carlyle's style is unlike the English of our own?

Mr. Minto, however, has views of his own about excellence of style. We had hitherto held that the best style was the style which most clearly conveyed the thoughts of the writer to the mind of the reader. Mr. Minto, it would seem, thinks otherwise. He scoffs at the notion that the difficulty of a subject can never be pleaded as an excuse for want of clearness, and that if an author's own ideas are clear, he should always be able to make them clear to others. Mr. Minto boldly asserts that "want of simplicity is not an absolute fault." He considers that "abstract subjects such as science or logic cannot be treated of in simple words, and that, though such words may make the subject clear to the unlearned, they only confuse the learned and scientific reader." If this were so, it would seem that the study of science must have a very bad effect on the brain, since it makes its followers incapable of understanding plain English. But the fact is quite the reverse of this. Those who have thoroughly mastered any science find no difficulty in imparting their knowledge to others in the simplest words. It is only semi-ignorance that loves to conceal its lack of light behind the veil of scientific slang. Men of real power know that if they wish to be understood they must find their words in the world. No words are so clear as common words; therefore, as clearness is the greatest characteristic of truth, if their thoughts be true, they must clothe them in familiar words. It is, indeed, only by the use of these familiar words that they can ever make their thoughts pass current as acknowledged truths.

Such a book as Mr. Minto's, painstaking as it is, is practically useless. It is impossible to make a book as one might make a pudding, by mixing up a variety of ingredients according to a carefully prepared recipe. It would be as hopeful a task to set to work to make a fine picture by grouping a given number of objects in strict accordance with the laws of perspective and of colour. The art of writing well may be learnt, but it can never be taught. The various devices which Mr. Minto suggests as "useful school exercises" remind us of the task of "turning Chaucer into good English," which is, we believe, much in favour in certain ladies' schools. The plain truth is that it is impossible to give a strict definition of style. The charm of a happy style is easily felt, but it is hard to understand, and harder still to explain. Southey said that to write well men have only to write as they speak; but Southey was wrong, for the words that sound very well when warmed by the expression of the speaker's glance and tone are often found to fall far short of his meaning when they are set down in black and white. Hence it comes that many a good speaker is a very poor writer, and that others again, like Goldsmith, can "write like an angel," yet speak "like poor Poll." Our greatest writers have been for the most part men of desultory reading who certainly never attempted to form their style by adhering closely to any fixed

* *Manual of English Prose Literature*. By William Minto. London: Blackwood & Sons.

Lost Beauties of the English Language. By Charles Mackay, LL.D. London: Chatto & Windus.

Introduction to the Language and Literature of England. By G. B. Abernethy-Mackay. Calcutta: Wymann & Co.

rules of composition, still less by imitating the style of another author.

The title of Dr. Mackay's book, *Lost Beauties of the English Language*, gives us no inkling of the nature of its contents. It is merely a collection of words picked up at random, but many of them are not "beauties," and many more are not "lost." It is by the author's introductory essay that we must judge of his fitness for carrying out the difficult task he has undertaken of winning back a place in the popular speech for words which have dropped out of use. Dr. Mackay begins by announcing that "Many learned and interesting works have been written on the origin, growth, and present state of the English language." It is perhaps just as well that he gives his readers this information at starting, as they might read through the whole book without guessing that any learning or research had ever been brought to bear on the subject. Whatever these "learned and interesting books" may be, Dr. Mackay heeds them not, but trusts solely to the light of his own inspiration. In his first page he tells us that all the languages of antiquity have passed through their several stages ending in their death, and that "after death has come the apotheosis or burial in books." But by the time he has got to the next page it seems to have struck him that, after all, perhaps modern languages did not spring up like mushrooms, but must have a root somewhere, as he talks of "the languages of modern Europe that have sprung directly from the Sanskrit and the Celtic." Unfortunately he does not tell us whether English has sprung from the Sanskrit or from the Celtic. Whichever it sprang from, however, Dr. Mackay is very hopeful about English, and thinks that it will one day be the all-pervading language of the civilized world. We are quite willing to believe in Dr. Mackay's prophecies about the future of English as long as we are not required to agree with his notions about its past history. Dr. Mackay says, "The English and Scotch languages are both mainly derived from the Teutonic; and five or six hundred years ago may be correctly described as having been Anglo-Saxon and Scotch-Saxon." Again, we are told that the "Old English words derived immediately from the Dutch and following the Dutch rules of pronunciation are exceedingly numerous." Dr. Mackay, it is clear, cannot get rid of the notion that when the English of Northumbria changed masters they somehow changed tongue too, and forgot how to speak English. He tells us that Anglo-Saxon is derived from Low German, and that Scotch-Saxon is derived from Dutch, Flemish, and Danish. The philology to be found in the explanatory notes appended to the words in the vocabulary is very much such as we should expect to find from the tone of the introduction. Whenever Dr. Mackay lights on a word in a foreign tongue like an English word, he at once takes it for granted that the English word is derived from the foreign one, though the former may bear unmistakable signs of being the elder born. He thus derives "beck" from the German "bach," "starve" from "sterben," "thorp" from "dorf," "weldin" from "wolken," "sheen" from "schön," "wort" from "wurz," and so on. With strange inconsistency, in illustration of the use of some of these very words to which he ascribes a German parentage, he gives quotations from Chaucer, Gawin Douglas, Shakespeare, and other writers who can hardly be supposed to have reckoned a knowledge of High Dutch among their accomplishments. Some of Dr. Mackay's derivations from the Gaelic are wondrously ingenious. "Quick," he tells us, is from the "Gaelic coig, five, applied to the five senses, thence to one in possession of his five senses—living quick." We had thought that seven senses was the number which it was supposed one would lose on seeing anything very startling. But doubtless Dr. Mackay discerns a mystical meaning in the rhyme "One, two, three, four, five, catching fishes all alive."

In his title-page Dr. Mackay calls his book "An Appeal to Authors, Poets, Clergymen, and Public Speakers." There is, we grant, great room for improvement in the English preached by popular preachers; but we fear that, should one of their number address some of the words to be found in this collection to his fashionable admirers, he would only succeed in sending them away "all amot" at the unvoiced sounds, and convinced that their idol has lost some of his senses, seven, or five, or whatever number they may consider him to have been possessed of. If Dr. Mackay wishes to be a real reformer of the English of the present day, he should remember that example is better than precept, and should abstain from the use of foreign words when English ones will do quite as well. Why should we be told that a "ship-master is a mere *employé* in the mercantile marine, and ought not to be called captain, which is a military title, and only allowable in the case of an officer in the naval service of the sovereign." Of course "master" implies employing much more than being employed, and captain carries us back to those days before the existence of "Cheeks, the marine," when Monk shouted "Left wheel" to his ships, and when land troops had to fight as best they might on shipboard. But Dr. Mackay seems to have forgotten a better word than either captain or master, a word which has been in use both before and since the days of Sir Patrick Spens. Does not the old song tell us that

The King sat in Dunfermline Town
Drinking the blood-red wine.
O! whaur shall I find a skeely skipper
To sail this ship o' mine?

Whereby we learn that the king himself applied "skipper" even to "an officer in the naval service of his sovereign."

The next book on our list is *An Introduction to the Language and Literature of England*, by G. B. Aberigh-Mackay. Whether

this Mr. Mackay be derived from Dr. Mackay or not we are not told, but we should think that, according to Dr. Mackay's theory of derivations, the whole clan Mackay must, somehow or other, be derived from one another. On turning over Mr. Mackay's pages, however, we see at once that what he knows about the English language has certainly not been derived from his namesake, and that he seems to have read and partly understood some of those "learned and interesting works" of which Dr. Mackay has only heard. From these works he has found out that the English people could not only speak their own language, but also knew that it was called English, and that it did not signify in what part of the island they lived, for they spoke English just as much north of the Tweed as they did south of it. Still he seems to think this simple truth too startling to be allowed to pass without some explanation, and forthwith he tries to explain it away, and to perplex his readers by talking about "Original English," "Semi-English," "Middle English," "Broken English," and so forth, thus needlessly filling up many pages of a book which strikes as being much too small to do justice to so large a subject. The Historical Sketch indeed takes up more than a third of the whole book, and this seems the more to be regretted when we find what sort of history it sets forth. We learn from it that the Normans under Rollo the Changer (freely rendered "Freebooter" by Mr. Mackay) obliged the Franch King to give up to them a "province on the coast of France." Shortly afterwards, we are told that none of the Norman "or Angevin kings of England, with the exception perhaps of Richard II., ever could or did speak English." Now every one knows that Edward I. could not only speak English well, but that he could jest in it too, a liberty which no one ventures to take with a foreign tongue unless he is quite at home in it. The King who could write bidding his son "win his shoes and boots worthily" in putting down the rebellious Scots must have felt very much at home in the language he was using. The rest of Mr. Mackay's little book contains short notices of English authors, small and great, from Caedmon down to Keats. They are much like other notices of English authors in other small books of the same class; that is to say, they are made up of a pair of dates and a list of the author's books, the name of the place where he was born, and of the school he was sent to. Sometimes Mr. Mackay ventures on an opinion as to the author's merits, as when he tells that "Hume's *History of England*, though abounding in error and prejudice, must ever remain a standard historical authority." If we may judge of Mr. Mackay's powers of criticism by this sentence, we cannot regret that he had not more space for displaying them.

A BOOK ABOUT BRISTOL.*

THE title-page of this volume is in no respect a misnomer. It describes exactly what may be expected in the work which it introduces. No other designation could so accurately describe the miscellaneous nature of the contents of the book. If the author occasionally travels beyond his brief, his digressions at least admit of the defence that they have some indirect connexion with the city of his residence. He is evidently a person who has thought it his business to make himself familiar with all that concerns the place, and whose pleasure has been to hunt up all the archives of Bristol, not only in the volumes under his care at the Bristol Library, but also in parish registers and ancient documents which have perhaps not been read for centuries. Mr. Taylor has a right to describe his work as he does, as being derived from "original research"; and the evident amount of pains and trouble bestowed on that research makes us much regret that the result should appear in so unsystematic a form. The book is partly a guide-book for strangers, partly a handbook for antiquaries; it contains several interesting little bits of historical information which do not lie exactly on the high road of English history, and many anecdotes of celebrities which are amusing enough, but which do not fit into any well-concerted plan or purpose in writing. It looks as if the writer had dotted down little bits of information as they came to hand, and had crammed them in where he could without regard to arrangement or system. There are even repetitions of parts of the same story in different parts of the work. From the whole we gather that the author has a considerable amount of knowledge of various subjects, but, we must add, very little power of presenting that knowledge in an interesting manner. Mr. Taylor is just the kind of writer whom we should like to encourage, for we are sure he may do better service to the cause of history and literature than he has yet done. But he must not again attempt to unite the penny-a-lining of a guide-book with the more accurate style of writing adapted to a work which aspires to a higher class of readers. We do not mean that the style of writing in which Mr. Taylor sometimes indulges would meet our approbation even in a professed guide-book; indeed he sometimes uses words and expressions in a sense which cannot be justified; but we are glad to see these blemishes almost entirely disappearing towards the end of his book, which is the most business-like part of it, when he is describing the destroyed churches of the city.

The volume may be divided roughly, but certainly not with logical precision, into four parts, the first of which contains historical notices, the second is devoted to the description of old

* *A Book about Bristol: Historical, Ecclesiastical, and Biographical; from Original Research.* By John Taylor, Librarian of the Bristol Museum and Library, Author of "A Guide to Clifton," "Tintern Abbey, and its Founders," &c. London: Houlston & Sons.

churches, the third gives some details about Bristol in mediæval times, and the last professes to be a guide to the streets and principal buildings. The historical notices, which run over a period of eight or nine centuries, are brief, and as they are almost wholly taken from printed books, we may pass them by without further notice. When the author comes to the description of the churches he is more in his own element. His previously published guide to Tintern shows what are his natural tastes, and how he has turned them to good account by his knowledge of photography, which he has used with good effect in that volume, though he has not embellished the present volume in the same expensive way. This part of the work exhibits both the strong and the weak points of the writer, who is both learned and ignorant—that is to say, he knows so much of all the miscellaneous subjects of which he treats that we are surprised every now and then to find him quite ignorant of common things. This part also exhibits occasional instances of a stilted style of writing which he ought to be on his guard against. The Cathedral naturally leads the way, and here we have very properly inserted (p. 51) Mr. Street's description of the Abbey Gateway, in which that architect gives his opinion that it is original, and not, as has been supposed, a copy of the fifteenth century; but instead of saying here all that was to be said on the subject, Mr. Taylor recurs in another part of the book a few pages later to the counter theory, giving Mr. Godwin's opinion, which we can scarcely think to be correct. Here, too, we find instances of the use of fine language—*re-edified* for *rebuilt*, and so on; and the writer has not quite come up to his work as guide to the Cathedral. We should, for instance, have expected a fuller description of the east window, the whole tracery of which consists, appropriately to a church dedicated to the Holy Trinity, of a most elaborate representation of the idea of Three in One. The historical notices range from the time of the first abbot down to the present, or at least to the last generation, when Sydney Smith held a prebendal stall. Under the sub-section, "Knightly Names of the First Minor Canons," we have the names and the salaries, with a note added to the effect that the prefix of "Sir" is clerical rather than baronial; the author seems to forget that this was the common designation of a priest, and had nothing whatever to do with baronial rank. Again, the impeachment of the Protestantism of Day, Bishop of Chichester, is quite out of place, as he never was or professed himself a Protestant, a name he probably would have abhorred, having been deprived by Edward VI. for adhering to the old learning, and kept in prison nearly till his death. Again, there is something amusing in the idea of Cardinal Wolsey's correspondent being spoken of as "one Hannibal." So important a functionary as the Master of the Rolls need not have been described as if no one had ever heard of him. Such mistakes, taken in conjunction with the amount of learning and original research which the volume displays, are the more provoking as they puzzle a reviewer on what principle to account for them. Nor probably is there any better account to be given of them, or more honourable excuse for the writer, than to say that we suppose he is a self-taught person. If this is so, he is a remarkable instance of combined ability and perseverance. How industrious he has been may be gathered from many of his researches, and especially from his notices of St. James's Church, Bristol. The vestry accounts belonging to this church go back to an early period, and some interesting extracts have been made from them. Everything seems to show that this parish has had an almost continuous succession of Puritan ministers from the early days of Elizabeth up to the present time. We doubt whether anywhere else in England a penalty for Sabbath-breaking could have been enforced in 1679, such as it appears, the minister and churchwardens of the parish procured in a sentence against four persons for exceeding the ordinary length, whatever that may have been, of a "Sabbath day's journey":—

So strict observers of the Sabbath were the people of this parish no longer ago than 1679, that at a vestry then held here four persons were judged guilty of a most heinous crime, and were cited into the spiritual court for purloining the Lord's Day in travelling to Bath on foot, to the great dishonour of Almighty God and true religion, for which they confessed their sins in the said Court and paid 20s. for the use of the parish.

The Puritan spirit, however, had existed from an earlier date than the reign of Elizabeth at Bristol. Amongst the anecdotes scattered so thickly through this volume we have one relating to the mayoralty of John Stone, who, Mr. Taylor tells us, had four wives; but what is more to the point, he enables us to add another example to the two hundred and odd martyrs of Mary's reign:—

When he was at Mass there came a weaver out of a little door in the weaver's chapel, and exclaimed, "Fie upon the idolatrous worship!" upon which this John Stone caused his serjeant to apprehend him, and being convicted he was burnt for the offence on St. Michael's Hill, near the turnpike, where the four roads meet.

Nothing seems to come amiss to Mr. Taylor. His anecdotes range from Pickwick to Puritanism, from murders to ghost stories, from Harold the Danutless to the poet Southey, from the ninth to the nineteenth century, and the subjects occur somewhat in the helter-skelter way in which we have here arranged them. His fondness for differences of religious belief and anecdotes connected with them makes us almost wonder and regret that he has not inserted a tradition, which we remember to have heard, of the difference between the General Baptists who assembled at Broad Mead and the Particular Baptists who worshipped at the Pithay, of whom it was said that the former believed that the latter would be lost, whilst the Pithay congregation,

it was said, feared that the others would attain this fate. We do not guarantee the truth of the story, which must be judged of by antecedent probabilities.

At the end of the volume we come to some scattered notices of some of the sixteen destroyed churches of the city. Bristol has been called the city of churches, and they still stand very close together in the older parts, forming in this respect a striking contrast with the additions which have been of late years made to the streets and buildings of the old city. Mr. Taylor has had access to the documents of St. Ewen's which have not shared the fate of the church itself, and reach back to the fourteenth century, or perhaps earlier. He has given several interesting extracts. We wish he had printed many more. The last set belong to the year 1548, and bear upon subjects which have been more or less before the public during the last few months. It furnishes a somewhat curious illustration of the meaning of the much-disputed Ornament Rubric that at the very time when the churchwardens were paying for the use of the axe and the hammer in demolishing rood-lofts and images, and buying the newly-compiled Homilies and Injunctions, three items of the account are for mending a cope, placing an embroidered green stole, probably a frontal, before the high altar, and for bringing the holy oil. And this, unfortunately for the Church Association, belongs to the second year of the reign of King Edward VI.

There is an Appendix which modestly occupies only a single page, and which contains a valuable piece of information which has never before seen the light. And here Mr. Taylor has made good use of the MS. stores of the library which is under his care. It relates to the founding of the see of Bristol. No historian has noticed the fact that the Pope in Mary's reign gave his sanction to the existence of the see which was one of the six founded by Henry VIII. without the approbation of the Apostolic See after the severance of this country from its dominion. After the resignation of Paul Bush, who was made the first bishop of Bristol by Henry VIII. in 1542, John Holyman was appointed to the see, and was consecrated in 1554, but by some mistake of Cardinal Pole's, his original appointment took place before the see had been properly recognized by the Pope; and the document in question, which we wish Mr. Taylor had printed at length, is intended to remove all objections that might be taken on the score of informality, and to place Holyman in the firm possession of his see, just as if no mistake had been made as to the original foundation of the bishopric. It is very remarkable that so important a Bull should never have found its way into print, and should not even have been copied for the Vatican Transcripts in the British Museum. We hope that before long, not only this, but several other manuscripts from the Vatican Library may be copied and made accessible to English students of political and ecclesiastical history. In the present instance, we are indebted to the zeal of a Bristol citizen for the existence of the transcript, Mr. Harford, a gentleman who bears a time-honoured Bristol name, having procured it when residing at Rome nearly half a century ago.

LIFE OF T. T. LYNCH.*

WE have no doubt that if the good man some passages of whose life are here recorded by Mr. White could have anticipated the posthumous honour that was in store for him, he would have deprecated it as heartily as did a more eminent minister of the same religious communion, Dr. Thomas Finney. Yet we cannot wish that this little book had never been written, true as it obviously is that "the materials for an adequate and attractive biography do not exist" in the case of its subject. It is interesting and very instructive to turn over these meagre pages, wherein is enshrined by loving hands the memory of a man not at all obscure within his own circle, who passed a life of fifty-three years in London, but was scarcely known to the general public. Yet Mr. Thomas Lynch, the Congregational (or, as he rather liked to style himself in his old-fashioned way, the Independent) preacher, was, in his way, a remarkable man; one who by example, as well as by precept, taught those around him to suffer bravely and cheerfully some of the sorest ills our nature is heir to—pain, detraction, anxiety, poverty, and this enduring from the cradle to the grave. Throughout his whole career, indeed, Mr. Lynch could hardly have known what prosperity meant. Born at Dunmow in Essex in 1818, when but two years old he lost his father, a surgeon in that little town (famous as the scene of the periodical farce of the *bacon-bitch*), who sacrificed himself by rising from a sick bed to attend a patient seized by sudden illness. The widow, with a burden of eleven children, settled at Islington, and fought hard to gain them bread. She is described as "a woman of great energy, and most genial disposition—artless, affectionate, cheerful, attracting the love of all that knew her"; pious, and rejoicing over the pious thoughtfulness of her son; but doubtless a Nonconformist, for Thomas, while only in his twentieth year, spoke of himself as a "Dissenter," though he did not formally join the Congregationalist body till three years later. With the English Church and its clergy we may charitably presume that he formed no real acquaintance at any period. Happily he seldom speaks of them, but when he does, it is with a bitterness of spirit which mere ignorance will best account for. "A haughty arch-priest" and "a hard sea-monster"

* *Memoir of Thomas T. Lynch.* Edited by William White. London: Isbister & Co.

(p. 265) are the convertible terms of his playful moments. In his more earnest moods he writes:—"As I stand in a cathedral, I say, 'Ah, how glorious you would be were it not for the clergy'; and then I add, 'You are grand enough to rest patient for a century or two; you are a tomb now, you will be a shrine by and by; you wait for worshippers, and shall not wait vainly'" (p. 178). But in truth a century or two were long to wait for such a blessed consummation. "I believe in justice," he writes quite near the end of his life, "and Anglicanism is injustice. The Established Church could not remain as it is for a twelvemonth, but for the superstition of Respectability, and out of that fetid mist we must all keep our heads lifted up clear and high" (p. 290). Elsewhere, "Episcopalians, Unitarians, Catholics" (sic), are included in the same category of evil.

It is not our design, however, to exhibit Mr. Lynch as a narrow bigot, still less as a mischievous demagogue; we rather aim at noting the sad influence of perverted training and inveterate prejudice even over an ingenuous and reflecting disposition, as beyond question his was, in spite of the rabid outpourings we have just quoted. *Omne ignotum pro odioso* is a ruling principle with too many persons, and one ought rather to grieve over than to condemn the blind aversion which was the natural result of antecedents such as we have now to detail. His mother sent the boy, of lively vigorous intellect, with an eager thirst for knowledge, to some school at Islington, in which he was afterwards employed as usher. He came to read a little of the Septuagint and Greek Testament with a fellow-assistant, who valued him so much (so he called to mind long afterwards) that he bought himself a Hebrew grammar, lexicon, and Bible, on purpose to help the youth by learning the sacred tongue with him. At eighteen a sudden affliction overtook him. Whilst sitting at dinner he was seized with a constriction of the throat, which for the rest of his life, except at a few intervals, hindered his swallowing solid food, but did not touch the voice or any vital organ. His appetite continued good, and he had thus often to endure the pangs of semi-starvation. This strange affliction set its mark upon Lynch's whole career. Study and business being necessarily suspended, he sought for recreation in botany, in verse composition, and in music, in which last pursuit he found exquisite satisfaction, his favourite composer being Purcell, who, as he justly thought, has never received the appreciation that is his due. After a while he resumed the teacher's work, of whose responsibilities he had formed grand ideas, as also of the qualifications, particularly the moral qualifications, that are required of him. Feeling the effort of a fresh experiment at tuition to be beyond his strength, he was compelled to fall back again on retirement, which he beguiled by trying to make up for the defects of a shambling education by private reading and attending a few lectures at University College. Meanwhile his inclinations were gradually tending to the ministerial office. He took his part in Sunday-school work and cottage lectures to the poor, and even joined for a brief time the College at Highbury as a day student, though he was soon led to withdraw by his nervous weakness. In spite of all his infirmities, his cherished purpose was carried into effect, though not till his twenty-ninth year, that in which he lost his mother. In 1847 he became known to the Independent community at Highgate, which was then in a dwindling condition. Such as it was, he accepted the invitation of the congregation and became its pastor. "There are here," he writes, "nightingales and cuckoos, as many as one could wish; but Christians and Dissenters are by no means so plentiful" (p. 71). The Dissenters may be estimated by the average number of Mr. Lynch's hearers—about six men and twelve grown women; those who know the pleasant village of Whittington and Sir Roger Cholmely, of Coleridge and the nightingales, will surmise that there may perhaps have been a few Christians there who were not Dissenters. But a twelvemonth sufficed for dreary work like this. To borrow his own language in his farewell sermon, "The feathers of the sitting bird become worn and her breast sore, but when life appears she is rewarded with the joy of parentage. But what if her eggs were but chalk egg-shaped, or have lost vitality. . . . Poor bird! feathers worn, breast sore, but no young. And poor minister! if he spends and grieves himself, and no hopeful results."

With this appropriate metaphor on his lips he came down from the hill of cuckoos and nightingales to a concert-room in Mortimer Street, there to tend a few stray sheep who had wandered from the fold of Dr. Leifchild, and with whom, and with others whom he gathered round him, he subsequently removed to a larger place unassouly situated in the Mews behind Fitzroy Square. His highest translation was from a room in Gower Street to an iron chapel near the Hampstead Road, not very commodiously erected over a railway tunnel. The twenty-four years of his humble ministry were constantly interrupted by paroxysms of illness which enforced upon him vacations, sometimes of more than a year in length, and were embittered by a dispute whose miserable details take up a full third of Mr. White's volume, and which is dignified by him with the name of "The Rivulet Controversy"; the *Rivulet*, as appears from his description, being a little rill of holy song set running by his hero over the parched desert of orthodox Congregationalism, whose assemblies had long recognized but one divine poet, dear old Isaac Watts. Since no church or minister was obliged to use Mr. Lynch's hymn-book unless it seemed a good one, it is hard to see how the simple attempt to enliven the public exercises of religion in this way could be deemed a profane use of the unwelcome leisure imposed by sickness on its

author. But the new hymns were vigorously attacked by certain religious newspapers—the *Morning Advertiser* in particular—and by these ruthless critics the *Rivulet* was proclaimed to be absurd, unspiritual, pantheistic, and was characterized by other choice epithets which mean much or nothing according to the habits and powers of those who use them. If, as we rather fear to be true, the new hymnologist was "not even at the bottom of the scale as Post," that fact might surely have settled the whole matter, and spared the poor invalid a world of pain. For Mr. Lynch took seriously to heart all the harm he read about himself. Even time failed to bring to the hapless rhymist its wonted assuagement. From 1855, the date of the publication of the *Rivulet*, down to 1871, when his long disease came somewhat sharply to an end, he never ceased to regard himself as an injured, maligned, and smitten man. A loving wife and son were the only earthly solaces of his weary, uneventful pilgrimage. His portrait, which faces the title-page, reminds one for a moment of Liston's expression when he acted Mawworm; but a second glance dispels the illusion, and the deep lines of the countenance speak of days and nights of anguish as well of body as of soul.

Mr. White declares that those who knew Lynch, whether through his ministry or his writings, were urgent to have some account of his career, however imperfect. "If there is not much to tell," they say, "at least let us have what there is." The result may disappoint them if they expected much in quantity, for his extant letters are few, and of his fresh and genial conversation almost nothing is preserved. What they will find is, however, interesting and instructive. We do not believe that Lynch ever consciously gave up any one of the drier dogmas of his denomination, but he habitually breathed a free and pure atmosphere in a higher region of thought. His view of life in the abstract was a cheerful one. "I am inclined to think," he wrote early, "that there is more sweet than bitter mingled in man's cup—that there are more happy persons in the world than sad ones—that the joyous moments of human life, of every individual life, outnumber those of pain." Nor did he abandon this faith in his later years; almost his last words were, "Now I am going to begin to live." Without professing to be an exact scholar, he had maturely weighed the best thoughts of many of the profoundest thinkers; and in public lectures he delighted to impart the literary knowledge he had diligently stored up. Of his pleasant humour we will give just one specimen, not remarkable in itself, nor the best we have met with, but as a convenient mode of introducing what little we have further to say. A case of wine is sent to him in sickness from the shop of a Mr. Oliver:—

I must send you, according to the adage, a Roland for your Oliver. Roland was, I believe, a knight who could give stroke for stroke, and if he could not pay one kindness by another, no doubt he at least gave thanks promptly and heartily, as I do.

Your wine came with curious timeliness. The last glass of a last bottle had just been poured out, and I had said, "Now we must go to the dogs," meaning we must accept one of two evils, a pulse too low for the want of wine, or a pulse too low through procuring it. "To the dogs," said my wife. "No," said I, "though there is a vine enough there, doubtless; to the dogs," which she said was wicked. But could it be wicked, when, five minutes afterwards, as I was sipping a cup of coffee, "a case of wine" was announced?

This is something in the tone of Cowper, and to our mind is quite as edifying as the practice of Mr. Müller of the Bristol Orphanage, who, in his day of small things, used to draw by prayer upon the Bank of Faith. But is poverty such as we have here a glimpse of a whit the less deplorable because it is borne without complaint or ostentation? No doubt the gulf seems wide enough which yawns between the village minister dismissed from his pulpit for buying tea at the wrong shop (and we have actually known such an instance), and the mighty Beecher who makes his church an auction mart, or the mighty Spurgeon who has triumphed over lordly deacons; but they all alike owe the bread they eat to popular acceptance, and to be long popular a man must follow general opinion, not presume to lead it. Those who cannot bow the neck will fare like the subject of our memoir, and many a worthy and able man besides; they will not suffer absolute want, perhaps, but the fear and the near prospect of it will ever be upon them to damp their energies and fetter the free exercise of their nobler faculties. Poor Lynch kept a "Raven's Book," wherein he recorded such seasonable chance gifts (if, indeed, there be any chance in the matter) as his case of wine, but he had to complain that out of ten whom he had striven to benefit by his counsel, nine went away and made no sign (p. 275). Is he too feeble to preach oftener than once on Sundays? Then he feels himself compelled to say to his flock, "You will have to provide for the evening elsewhere. Let all feel free then to lessen their subscriptions" towards his maintenance. Is he so fortunate as to receive presents from his hearers, once of 70*l.* (p. 90), once of the vast sum of 200*l.* (p. 270)? "A sincere and faithful man" writes to tell him he is not pleased, that he envies neither pastor nor people, and fears they will be "ultimately ruined" (p. 278). The donee addresses the donors with sense and manliness:—

No directions have been furnished to me as to how I am to dispose of my two hundred pounds. It is a free gift, for my free use. But, as a free man, I shall feel bound so to spend and to save as may best enable me to make more efficient the spiritual service it is my duty and honour to render. Money is vile or precious according to the getting or the using. The having it is no sure heaven, the want of it may be a sharp purgatory. It

is a minister of sin and of righteousness; never the most, and sometimes the least, servicable of things; but usually a capital servant if it has even a tolerably sensible master.

If the getting up a testimonial is often a presumption that something has gone wrong (p. 91), it certainly was not so in this instance.

Would it not be well if wealthy Nonconformists, whose consciences or tastes force them to withdraw from communion with the National Church, would take more care than they do that pious and deserving men who labour among them should not come to poverty merely because they lack in their ministry just those qualities which are the least valuable and deserve the least esteem? Noisy and worldly-minded pastors will pursue their own interests keenly enough, and, if cast down from one position, will contrive to fall on their feet in another. "I do not want to go into the wilderness," says Lynch on one trying occasion, "but if I must, I have been there before, and perhaps an angel may meet me, bearing a pitcher of water, and I may find manna on the ground." To provide that in time to come such men as he should not have before them a prospect thus dreary when they have reached near fifty years of age, were surely a more worthy and Christian enterprise to spend zeal and strength upon than the poor endeavour to bring down the whole body of the English clergy, *per fas nefasque*, to the same forlorn and humiliating predicament.

ONE ONLY.*

IT has often been lamented, and with good reason, that while there exist schools of painting, of sculpture, of music, in every direction, there should be no recognized school of writing. The man or woman whose ambition it is to succeed with brush or chisel, with voice or instrument, finds the means of education ready of access. For those whose desires tend towards the skilful handling of the pen there are no such means provided. This is the more to be regretted because almost every one is in the habit of thinking himself capable of writing a book, although it might never occur to him that he was fitted by nature to excel in any other artistic line. A high authority on the subject, Dr. Wendell Holmes, has indeed delivered his opinion that every man has it in him to write one good novel; but this is one of those half-truths of which the repetition is somewhat dangerous. Those who quote this dictum in self-defence forget that its author has stopped short at saying that every man has it in his power to write one good novel. He has not added that every man can do this without taking pains to cultivate his power; still less has he said that the power of writing one book implies the power of writing many. It is curious that the same delusion which seems to prevail as to the existence of a universal gift for writing is applied almost to the same extent to the art of acting. Both these beliefs are in their nature singularly unreasonable. It is common enough to hear this kind of advice given to one in want of money or employment, or both, "Oh, write a novel. Anybody can write a novel." What the speaker really means is that he himself could write one. It is unfortunate that, in spite of this, the advice is frequently acted upon. As a matter of fact there are probably no callings which involve more hard work for the attainment of real success than those of the actor and the writer. We had occasion not long ago to point out some of the disastrous results which follow from the want of literary education. While such results are observed to follow frequently from the want of a school, some credit is due to writers who make for themselves a school by the imitation of models which are recognized as good. And this credit is due to the writer of *One Only*, which we may take without much danger of mistake to be the work of a woman. What model the author has selected will be easily discerned from one of the opening passages of the book:—

Thirty years ago the beauty of Aldersham was Miss Rose Camden, the only daughter of an old major, who lived in a small house half-way up the hill behind the town, and was employed as his agent by a nobleman in the neighbourhood. This young lady was standing one morning—it was a market-day—at the end of the bridge near the water-mill, talking to a gentleman who had dismounted from his horse, and was stroking and gazing at it absently, while he gave her his full attention. It was May-time; the pear-tree on the end of the mill was a mass of blossom, and so was an orchard higher up the lane; a blue sky was over their heads, birds were singing, and merry sounds came from the street. The gentleman who was talking to Miss Camden thought her prettier than all the flowers in May. She was fair, small, delicate, and certainly very pretty, with the complexion of a lady in Sévres china, and blue smiling eyes, "like Wedgwood saucers," as they were described by one of her rivals.

The influence of Miss Thackeray is here readily perceived in the accumulation of undefined details of scenery. It is a favourite device with the author of the *Village on the Cliff* to describe birds singing and merry sounds coming from the street without more particularly stating what are the birds and what the merry sounds. In this way a pleasant dreamy impression is produced upon the reader; his imagination is gently stimulated to fill up for itself the details which are only suggested by the writer. From this happy medium between too great and too little elaboration of description, as well as from many other causes, Miss Thackeray's books are always pleasant to read. The writer of *One Only* may be congratulated on having chosen a good model to follow; but imitators should not forget the maxim, "*Decipit exemplar vitis imitabile.*" It must be said also that in the present case the disciple has not

always paid sufficient attention to the method of the master, and therefore the work produced presents in parts an incongruous appearance.

It will be easily imagined that the gentleman who is introduced in conversation with Rose Camden is not the only one of her admirers. He is a young man named John Atherley, the banker of Aldersham, good-looking, and rich. But there is another young man named Charles Fenwick, who is rich beyond the dreams of avarice. He is not particularly good-looking, and is particularly strange. He is a dreamy, sentimental creature, full of old-fashioned fancies and formalities. Much may be allowed for the influence of a wholly retired life spent in the company of an invalid mother and brother; but it is scarcely conceivable that even under these circumstances a young man of the present age should invariably address the girl with whom he is in love as "My dear young lady." Apart from a few trivial mistakes of this kind, however, the character of Charles Fenwick is neither ill conceived nor ill executed. It is no doubt true to nature that such a man should concentrate his whole power of affection on "One Only," that one being a girl like Rose Camden. Soon after the scene of which we have quoted part, Major Camden and his daughter pay their first visit to Mrs. Fenwick, and Rose, while walking through the garden with Charles, confides to him that she has a trouble from which he might possibly extricate her, and promises to consider the possibility of asking his help definitely. The reader has been given to understand that Rose is not really so good or so charming a person as she appears in the eyes of John Atherley and Charles Fenwick. Still it is a little surprising to find that the help which she decides to ask for is the loan of fifty pounds, for which Fenwick generously substitutes a hundred. It is true that she exhibits a certain shame in making her request, and, considering the object for which, as afterwards appears, it has been made, she could hardly do less. This is the beginning of an intimacy with Charles Fenwick and his family which Rose fosters and encourages in every way. The invalid mother and brother find a new interest in the prospect of Charles's happiness, and the old lady presents her with a bracelet valuable as well from associations as for itself. To the acceptance of this gift Rose exhibits an almost invincible repugnance, but it is forced upon her, and is regarded as a kind of seal set upon her unexpressed engagement to Fenwick. The hopes of all the people who are looking forward to the completion of this engagement are defeated, as the reader has conceived that they would be, in an unexpected manner. There is a garden party given by Lord and Lady Aldersham, the magnates of the county, at which there is much talk over the marriage which is supposed to be impending between Fenwick and Rose. In the midst of the party, however, Rose is found to have disappeared suddenly, and inquiry leads to the discovery that she has eloped with an Oxford undergraduate named Dupuis, paying the cost of the post-horses, the licence, and other necessities with the money which she borrowed from Fenwick. We called attention just now to the gift of a bracelet from Mrs. Fenwick to Rose Camden, because it is dwelt upon at some length by the author, and leads to a curious blunder on her part. It is not credible that so courtly an old lady as Mrs. Fenwick is described to be should, on hearing the news of Rose's elopement, think of the loss of her bracelet before the destruction of her son's happiness, and spend her time alternately in calling the woman whom he has loved a thief, and abusing him for not instantly recovering her property.

With the elopement of Rose Camden the best part of *One Only* is concluded. Although it contains many improbabilities and mistakes of treatment, such as the introduction of a number of entirely superfluous characters, it contains some promise. The writing is often pretty, and is commendably free from faults of grammar. It is unfortunate that this should be matter for commendation at all, but as the presence of bad grammar is a crying fault in the novels of the day, it is only fair to notice its absence in the work of a new writer.

The marriage of Dupuis and Rose is followed by the return from India of a brother of Charles Fenwick's, who has been mentioned at intervals in the course of the story. There is no kind of reason why he should appear at all, as he only returns in order to die almost at the same time as his mother. There is a sort of passion for the introduction of death scenes in novels of the present day. The fashion was set some time ago by a writer who in her first attempt undoubtedly displayed power enough to warrant her handling the subject. But it is a fashion which it is ill to follow, and it would certainly be difficult to find a scene of the kind more out of place than the death of the mother and son in *One Only*. It possesses neither dignity nor pathos, and is evidently dragged in merely because the subject is supposed to be attractive. Gerald, the invalid brother who has been mentioned before, is killed off soon afterwards, and after this wholesale massacre the author introduces us to a new generation. Atherley the banker is married and prosperous, and possesses a fascinating daughter: Mrs. Dupuis is living in wretched poverty with her husband, who has developed into a cross, peevish, elderly gentleman. Harry, her favourite son, a young man of the honest and athletic type, has just been thrown out of an employment for which he was but little fitted, by the breaking of a bank in which he held a clerkship. He goes to Aldersham with a letter to Atherley from Mrs. Dupuis, appealing to her former lover to do anything that he can for her boy. He is taken into the bank as a clerk, and visits at Atherley's house. As a natural consequence he falls in love with his employer's daughter, and is prevented from revealing his love by the consciousness of

* *One Only*. By E. C. P. 2 vols. London: Sampson Low & Co. 1874.

his poverty. It is perhaps needless to add that during his stay at Aldersham he rescues Charles Fenwick, now a broken-down old man, from a robbery with violence, and that Charles Fenwick dies conveniently soon afterwards, leaving all his vast wealth to Harry. About this time Mrs. Dupuis also dies. These frequent deaths are extremely tiresome, and are, moreover, out of keeping with the tone of the book, which is in the main quiet and pleasant enough. Indeed, the author would do well to remember that the step from a certain sort of quietude to dulness is not very long. If she contemplates writing more novels than *One Only*, she will do well also either to study more accurately, as we have before suggested, the model which she chooses to imitate, or to strike out a line for herself. Meanwhile, it must be remembered that a copy of some merit is better than an original of none.

few minutes' walk from the terminus of the North-Western, Midland, and Great Northern
Railways.

August 1874.

JOHN ROBSON, B.A., Secretary to the Council.

THE WESTERN COLLEGE, BRIGHTON.

Principal, Dr. W. PORTER KNIGHTLEY, F.R.C.P.

The Pupils of this long-established School enjoy the highest Educational advantages in
connection with the University of London, and the University Matriculation, the Civil Service, the Military
Colleges, or other Commissions, in all of which Dr. KNIGHTLEY's Pupils have taken high
places in the Honours List. In addition to the intellectual and moral training superior
health conditions are secured by all the appliances of a well arranged residence in this
favourable watering-place. Prospectuses of terms and Class-lists may be obtained by applica-
tion to the Principal, personally or by letter.

LEAMINGTON COLLEGE BOARDING HOUSE.—The

NEXT TERM commences on September 22. Inclusive Terms from 70 to 90 Guineas.
For Sons of Professional Men 4 Guineas less. There is a special Tutor and separate Dormi-
tory, &c., for small Boys. For particulars apply to the Rev. J. WOOD, Head-Master, or to
the Rev. J. S. RICHARD, Chaplain and House-Master.

FULLANDS, TAUNTON.—ONEFOLD MATRICULATION

and RE-EXAMINATIONS, and CAMBRIDGE PREVIOUS EXAMINATIONS, PRI-
VATE TUTORING, by Graduates of Oxford and Cambridge for the Universities, the Indian
Civil Service, Woolwich, and other Examinations generally. The next Term will begin on
September 21. For Prospectuses apply to the Rev. the SECRETARY.

FULLANDS SCHOOL, TAUNTON.—The aim of Fullands

School is to provide for the SONS of GENTLEMEN a thoroughly good Education,
similar to that given at the Public Schools, but at a moderate cost.

Principal.

Mr. REED, Fellow of the College of Preceptors, London.

Vice-Principal.

HEAD MATHEMATICAL MASTER.—Rev. WILLIAM REED, M.A., St. John's College,
Cambridge; 16th Senior Optima, Tripos, 1869.

HEAD CLASSICAL MASTER.—FRANCIS REED, Esq., B.A., Exeter College, Oxford.

There are Three School Terms in the year, of an average duration of Thirteen weeks each.
The Michaelmas Term begins on September 21, 1874.
Prospectuses may be obtained on application.

ABINGDON SCHOOL (Six miles from Oxford).—NEXT

TERM begins on September 19. Another Dormitory is now ready for occupation. A
Public School Training. Moderate and inclusive charges. University and Entrance Scholar-
ships.—Address, Rev. E. ST. MARTIN, Head-Master.

PRIVATE TUTORING FOR ARMY, COOPER'S HILL, CIVIL

SERVICE, WOOLWICH, and UNIVERSITIES.—Rev. Dr. HUGHES (Worcester, Cam.)
has moved over 300, and occasionally has VACANCIES. Also quite distinct young Boys.
Eding, W.

FOR COOPER'S HILL, WOOLWICH, and MATHEMA-

TICAL SCHOLARSHIPS.—For List of Honours already gained, address Rev. F. R.
DREW, M.A., Senior Master on the Modern Side, Malvern College, Great Malvern. Terms
for Boarding, 50 to 90 Guineas including Tuition.

INDIAN CIVIL ENGINEERING COLLEGE, Cooper's Hill.

CANDIDATES for Admission are specially PREPARED by the Rev. Dr. WHITFIELD,
M.A., M.D., F.R.S., formerly Professor of Mathematics, Addiscombe and late Examiner of
Candidates for Appointments in the Indian Civil Engineering Service and Indian Telegraph.
Address, 67 High Street, Cheltenham, N.W.

FOLKESTONE.—Mr. W. J. JEAFFERSON, M.A., Oxon.

formerly Principal of the Folkestone High School, Romney, with the Assistance of
a Cambridge Honorary Man, prepares PUPILS for the Universities, Indian Civil Service
Woolwich, and all Competitive Examinations. Terms and References on application.

A MARRIED CLERGYMAN, Incumbent of a Small Parish

near Oxford, formerly Tutor in several Families of Distinction, and late Master in a
Public School, receives Three or Four PUPILS to prepare for the University. Terms £200.
References given and required.—Address, Rev. M. A. OXON, care of Messrs. Masters & Co., 78
New Bond Street, London.

ARMY, CONTROL, CEYLON WRITERSHIPS, INDIAN

FORESTS, and ALL DEPARTMENTS of CIVIL SERVICE.—Mr. W. M.
LUTHERTON, late Examiner for Competitive Examinations, has for many years
successfully PREPARED CANDIDATES for the above.—Address, 9 Rathbone Place,
Oxford Street.

DELICATE and BACKWARD BOYS.—A GRADUATE

(Married) of Trin. Coll. Cam., an Old Englishman, has Vacancies for TWO PUPILS for
his next Term. He offers Classics, Mathematics, French, and thorough German, and every
care and home comfort for delicate Boys, and if desired, Hunting, Shooting, and Fishing.
Terms, 50 to 80 Guineas, according to age.—Address, Rev. H. R. L., Holdgate Rectory, Much
Wenlock, Salop.

AN OXFORD GRADUATE, in Honours, an old Marlburian,

and late Scholar of his College, receives PUPILS.—Address, Rev. W. EMMA, Great
Blakenham, Ipswich.

LADIES' SCHOOL, TAUNTON, for the DAUGHTERS of

GENTLEMEN.—The Education given is a thoroughly sound one, and the assistance of
experienced Masters is procured in the study of those branches of learning which are often
omitted in the Education of Ladies. The real work done is tested by that of the Preceptors,
and the Oxford Local Examinations, and by Examinations in the School itself. 7 Pupils passed
the Senior Oxford, and 6 the Junior, in the June Examinations, 1873-74; and at the Christmas
Examinations of the College of Preceptors, 17 Third-Class, 14 Second-Class, and 5 First-Class,
including Special and Honour Certificates, were gained by the Pupils, and the College First
Prize for English Subjects at both Examinations. Prospectuses forwarded on application to
the Head, Mary Street House, Taunton. The next Term will begin on September 21.

UNIVERSITY COLLEGE, London.—The PROFESSOR-

SHIP of GERMAN is VACANT in consequence of the death of Dr. HANMAN.
Candidates for the appointment are requested to send their Applications and Testimonials on or
before Saturday, October 3, to the undersigned, from whom further information may be
obtained.

August 17, 1874.

JOHN ROBSON, B.A., Secretary to the Council.

455, 457, 459, 461, 463, 465, 467, 469, 471, 473, 475, 477, 479, 481, 483, 485, 487, 489, 491, 493, 495, 497, 499, 501, 503, 505, 507, 509, 511, 513, 515, 517, 519, 521, 523, 525, 527, 529, 531, 533, 535, 537, 539, 541, 543, 545, 547, 549, 551, 553, 555, 557, 559, 561, 563, 565, 567, 569, 571, 573, 575, 577, 579, 581, 583, 585, 587, 589, 591, 593, 595, 597, 599, 601, 603, 605, 607, 609, 611, 613, 615, 617, 619, 621, 623, 625, 627, 629, 631, 633, 635, 637, 639, 641, 643, 645, 647, 649, 651, 653, 655, 657, 659, 661, 663, 665, 667, 669, 671, 673, 675, 677, 679, 681, 683, 685, 687, 689, 691, 693, 695, 697, 699, 701, 703, 705, 707, 709, 711, 713, 715, 717, 719, 721, 723, 725, 727, 729, 731, 733, 735, 737, 739, 741, 743, 745, 747, 749, 751, 753, 755, 757, 759, 761, 763, 765, 767, 769, 771, 773, 775, 777, 779, 781, 783, 785, 787, 789, 791, 793, 795, 797, 799, 801, 803, 805, 807, 809, 811, 813, 815, 817, 819, 821, 823, 825, 827, 829, 831, 833, 835, 837, 839, 841, 843, 845, 847, 849, 851, 853, 855, 857, 859, 861, 863, 865, 867, 869, 871, 873, 875, 877, 879, 881, 883, 885, 887, 889, 891, 893, 895, 897, 899, 901, 903, 905, 907, 909, 911, 913, 915, 917, 919, 921, 923, 925, 927, 929, 931, 933, 935, 937, 939, 941, 943, 945, 947, 949, 951, 953, 955, 957, 959, 961, 963, 965, 967, 969, 971, 973, 975, 977, 979, 981, 983, 985, 987, 989, 991, 993, 995, 997, 999, 1001, 1003, 1005, 1007, 1009, 1011, 1013, 1015, 1017, 1019, 1021, 1023, 1025, 1027, 1029, 1031, 1033, 1035, 1037, 1039, 1041, 1043, 1045, 1047, 1049, 1051, 1053, 1055, 1057, 1059, 1061, 1063, 1065, 1067, 1069, 1071, 1073, 1075, 1077, 1079, 1081, 1083, 1085, 1087, 1089, 1091, 1093, 1095, 1097, 1099, 1101, 1103, 1105, 1107, 1109, 1111, 1113, 1115, 1117, 1119, 1121, 1123, 1125, 1127, 1129, 1131, 1133, 1135, 1137, 1139, 1141, 1143, 1145, 1147, 1149, 1151, 1153, 1155, 1157, 1159, 1161, 1163, 1165, 1167, 1169, 1171, 1173, 1175, 1177, 1179, 1181, 1183, 1185, 1187, 1189, 1191, 1193, 1195, 1197, 1199, 1201, 1203, 1205, 1207, 1209, 1211, 1213, 1215, 1217, 1219, 1221, 1223, 1225, 1227, 1229, 1231, 1233, 1235, 1237, 1239, 1241, 1243, 1245, 1247, 1249, 1251, 1253, 1255, 1257, 1259, 1261, 1263, 1265, 1267, 1269, 1271, 1273, 1275, 1277, 1279, 1281, 1283, 1285, 1287, 1289, 1291, 1293, 1295, 1297, 1299, 1301, 1303, 1305, 1307, 1309, 1311, 1313, 1315, 1317, 1319, 1321, 1323, 1325, 1327, 1329, 1331, 1333, 1335, 1337, 1339, 1341, 1343, 1345, 1347, 1349, 1351, 1353, 1355, 1357, 1359, 1361, 1363, 1365, 1367, 1369, 1371, 1373, 1375, 1377, 1379, 1381, 1383, 1385, 1387, 1389, 1391, 1393, 1395, 1397, 1399, 1401, 1403, 1405, 1407, 1409, 1411, 1413, 1415, 1417, 1419, 1421, 1423, 1425, 1427, 1429, 1431, 1433, 1435, 1437, 1439, 1441, 1443, 1445, 1447, 1449, 1451, 1453, 1455, 1457, 1459, 1461, 1463, 1465, 1467, 1469, 1471, 1473, 1475, 1477, 1479, 1481, 1483, 1485, 1487, 1489, 1491, 1493, 1495, 1497, 1499, 1501, 1503, 1505, 1507, 1509, 1511, 1513, 1515, 1517, 1519, 1521, 1523, 1525, 1527, 1529, 1531, 1533, 1535, 1537, 1539, 1541, 1543, 1545, 1547, 1549, 1551, 1553, 1555, 1557, 1559, 1561, 1563, 1565, 1567, 1569, 1571, 1573, 1575, 1577, 1579, 1581, 1583, 1585, 1587, 1589, 1591, 1593, 1595, 1597, 1599, 1601, 1603, 1605, 1607, 1609, 1611, 1613, 1615, 1617, 1619, 1621, 1623, 1625, 1627, 1629, 1631, 1633, 1635, 1637, 1639, 1641, 1643, 1645, 1647, 1649, 1651, 1653, 1655, 1657, 1659, 1661, 1663, 1665, 1667, 1669, 1671, 1673, 1675, 1677, 1679, 1681, 1683, 1685, 1687, 1689, 1691, 1693, 1695, 1697, 1699, 1701, 1703, 1705, 1707, 1709, 1711, 1713, 1715, 1717, 1719, 1721, 1723, 1725, 1727, 1729, 1731, 1733, 1735, 1737, 1739, 1741, 1743, 1745, 1747, 1749, 1751, 1753, 1755, 1757, 1759, 1761, 1763, 1765, 1767, 1769, 1771, 1773, 1775, 1777, 1779, 1781, 1783, 1785, 1787, 1789, 1791, 1793, 1795, 1797, 1799, 1801, 1803, 1805, 1807, 1809, 1811, 1813, 1815, 1817, 1819, 1821, 1823, 1825, 1827, 1829, 1831, 1833, 1835, 1837, 1839, 1841, 1843, 1845, 1847, 1849, 1851, 1853, 1855, 1857, 1859, 1861, 1863, 1865, 1867, 1869, 1871, 1873, 1875, 1877, 1879, 1881, 1883, 1885, 1887, 1889, 1891, 1893, 1895, 1897, 1899, 1901, 1903, 1905, 1907, 1909, 1911, 1913, 1915, 1917, 1919, 1921, 1923, 1925, 1927, 1929, 1931, 1933, 1935, 1937, 1939, 1941, 1943, 1945, 1947, 1949, 1951, 1953, 1955, 1957, 1959, 1961, 1963, 1965, 1967, 1969, 1971, 1973, 1975, 1977, 1979, 1981, 1983, 1985, 1987, 1989, 1991, 1993, 1995, 1997, 1999, 2001, 2003, 2005, 2007, 2009, 2011, 2013, 2015, 2017, 2019, 2021, 2023, 2025, 2027, 2029, 2031, 2033, 2035, 2037, 2039, 2041, 2043, 2045, 2047, 2049, 2051, 2053, 2055, 2057, 2059, 2061, 2063, 2065, 2067, 2069, 2071, 2073, 2075, 2077, 2079, 2081, 2083, 2085, 2087, 2089, 2091, 2093, 2095, 2097, 2099, 2101, 2103, 2105, 2107, 2109, 2111, 2113, 2115, 2117, 2119, 2121, 2123, 2125, 2127, 2129, 2131, 2133, 2135, 2137, 2139, 2141, 2143, 2145, 2147, 2149, 2151, 2153, 2155, 2157, 2159, 2161, 2163, 2165, 2167, 2169, 2171, 2173, 2175, 2177, 2179, 2181, 2183, 2185, 2187, 2189, 2191, 2193, 2195, 2197, 2199, 2201, 2203, 2205, 2207, 2209, 2211, 2213, 2215, 2217, 2219, 2221, 2223, 2225, 2227, 2229, 2231, 2233, 2235, 2237, 2239, 2241, 2243, 2245, 2247, 2249, 2251, 2253, 2255, 2257, 2259, 2261, 2263, 2265, 2267, 2269, 2271, 2273, 2275, 2277, 2279, 2281, 2283, 2285, 2287, 2289, 2291, 2293, 2295, 2297, 2299, 2301, 2303, 2305, 2307, 2309, 2311, 2313, 2315, 2317, 2319, 2321, 2323, 2325, 2327, 2329, 2331, 2333, 2335, 2337, 2339, 2341, 2343, 2345, 2347, 2349, 2351, 2353, 2355, 2357, 2359, 2361, 2363, 2365, 2367, 2369, 2371, 2373, 2375, 2377, 2379, 2381, 2383, 2385, 2387, 2389, 2391, 2393, 2395, 2397, 2399, 2401, 2403, 2405, 2407, 2409, 2411, 2413, 2415, 2417, 2419, 2421, 2423, 2425, 2427, 2429, 2431, 2433, 2435, 2437, 2439, 2441, 2443, 2445, 2447, 2449, 2451, 2453, 2455, 2457, 2459, 2461, 2463, THE BRUSSELS CONFERENCE.

AS the representatives of the different Powers at the Brussels Conference have determined that their deliberations shall be private, it is not known, except by imperfectly authenticated rumours, that they have made any considerable progress in their undertaking. The English Government has taken ample precautions against the risk of any alteration in the laws of war or of any interference with the practices of maritime warfare. In answer to a formal inquiry the Russian Government assured the English Ambassador at St. Petersburg that there was no intention of discussing any matters not included in the original programme. "Consequently it is understood that neither maritime operations, nor naval wars, nor the relations of belligerents at sea, nor in general the recognized principles of international law will be entertained by us [the Russian Government] or brought forward for discussion." Notwithstanding the explicit assurance which is thus given, Lord DERBY adheres to his refusal of plenipotentiary powers to the English delegate at the Conference. Sir A. HOBBSFORD is to refer every point to his Government, which is not prepared to assent to a scheme for the regulation of military operations without considering it in all its bearings. The reservation is justified by the indefinite language of some parts of the Russian scheme. It is possible that the English Government might regard as involving questions of international law proposals which, in the judgment of the majority of the Conference, might only affect the details of military operations. The provisions for the military occupation of an enemy's territory may or may not be calculated to diminish the evils of war; but it can scarcely be doubted that they would largely modify the rights and duties of belligerents. The prudent firmness of the FOREIGN MINISTER may probably have been exercised in consequence of recent experience of grave difficulties arising from hasty attempts to alter international law. The timid precipitancy of the late Government in adopting the Three Rules of Washington resulted first in the adverse judgment of the Geneva arbitrators; and since that time it has been found impossible to agree as to the manner of submitting the Rules in accordance with the Treaty for the approval of other nations. The Government of the United States wishes that the Rules should be communicated without note or comment, although it is notorious that some of them admit of two opposite interpretations. The first attempt to substitute in international jurisprudence statutory legislation for the judicial interpretation of principles originally established in practice has not been fortunate. Lord DERBY is fully justified in declining beforehand to discuss new projects of law which might be consciously or unconsciously influenced by other interests than those of England. It is not desirable to interfere with the existing rights either of belligerents or of neutrals without a clear understanding of the possible effects of innovation.

The answers of the Governments now represented at the Conference to Lord DERBY's Circular are generally satisfactory, though they are not all equally explicit. The Duke DE CAZES, on behalf of France, remarks that the Russian programme includes no reference to maritime operations, and that therefore the French representatives could only deal with such questions "incidentally, in order to oppose, should occasion arise, the assimilation of operations of maritime warfare to those of warfare on land." The French delegates will be instructed to oppose any such extension, and in assuming the possibility of the discussion the French Minister is perhaps scarcely consistent with his

previous limitation of the business of the Conference to the express terms of the Russian proposals. It had been supposed, from the language used by the Minister in the Assembly, that the French Government entirely assented to Lord DERBY's opinion; and perhaps the comparative vagueness of the Note addressed to Lord LYONS may be merely accidental. The Spanish Government not only objects to any change of international law, but specially protests against the suppression of privateering, and the abolition of the right of capturing goods in enemies' vessels. It had been forgotten that Spain was not a party to the Resolutions appended to the Treaty of Paris in 1856, by which the parties to the Congress renounced the right of issuing letters of marque. The illusory nature of the change was illustrated during the American Civil War, in which neither belligerent equipped a privateer, though the United States had refused to agree to the Resolutions of Paris. It is perfectly easy to give a public commission to cruisers, instead of relying on private enterprise. Privateers were at all times useless to the State from which they received their license to plunder, except for the purpose of injuring an enemy's commerce. An armed vessel which will on occasion fight, as well as capture merchant vessels, is more useful than an old-fashioned privateer. The Swiss Government has not unnaturally taken the occasion of the Brussels Conference to propose the adoption of certain Additional Articles to the Geneva Convention, of which the consideration has been delayed by the war of 1870. The President of the Confederation assures the English Government that the Swiss representatives will not raise, directly or indirectly, any question relating to naval warfare. The further undertaking that no such discussion should be admitted perhaps becomes unnecessary in consequence of the guarded policy of England. The other minor Powers for the most part assent to Lord DERBY's proposals; and on the whole it is nearly certain that the attention of the Conference will be confined to its proper objects.

The form of the answers returned by some of the Powers throw a certain light on their political relations. The table of contents which is, as usual, prefixed to the despatches is not strictly accurate. A document forwarded by Sir A. BUCHANAN is described as "Answer of the Austro-Hungarian Government giving required assurance." The English Government had asked for an assurance that the Austro-Hungarian delegates should be instructed to confine themselves to the consideration of details of military operations of the nature of those dealt with in the project of the Russian Government, and also that they should entertain no proposals affecting maritime warfare. Count ANDRASSY replies that nothing is to be done with respect to maritime law, or any point in the law of nations which is not included in the programme of the Russian Government. Lord DERBY has from the first consistently refused to discuss any point of international law, whether it may or may not be mentioned in the Russian project. The German Government is still less explicit in a statement which seems to imply a perfect understanding with Russia. Count MÜNSTER simply informs Lord DERBY that nothing can be further from the intention of his Government than to extend the scope of the programme, and that "on this ground we shall signify to our plenipotentiaries that the declaration of the Russian Government is to be their guide." As some passages in the Russian Circular might be interpreted as affecting maritime warfare, the German Government reserves to itself liberty to exceed the limits of discussion which have

been proposed by Lord DERBY. As in the case of the abolition of the Black Sea Treaty, the two Imperial Courts appear to have concerted their policy without reference to the wishes of England. The answer of the Italian Government is the most unsatisfactory of all the documents relating to the Conference. *Cavaliere VISCONTI VENOSTA* carefully abstains from giving the assurance which had been requested either as to maritime warfare or as to the law of nations; and at the same time he avows, not without ostentation, the unbounded confidence of his own Government in any policy which Russia may think fit to adopt. Italy has, it seems, "agreed to be represented at the Conference without subordinating its adhesion to the greater or less extension of the programme which the proposing Power had presented. For this reason Italy is now in a position to agree in this respect to the decision which the Russian Cabinet may take in consequence of the observations of that of London." A further suggestion that the enlightened Government of England ought to contribute to "conciliating the philanthropic tendencies of the age" with the positive interests of each of the contracting States probably means, when it is translated from diplomatic jargon into ordinary language, that the maintenance of belligerent rights at sea proceeds from selfish motives which prevent England from coinciding with "the philanthropic tendencies of the age."

Lord DERBY's vigilance affords ample security that his Government will not be a party to any ambiguous declaration by which the promoters of the Conference may seek to affect the rights either of belligerents or of neutrals, and, if the secondary States of Europe are well advised, they will regard with the utmost jealousy proposals for altering the law of nations. Any decision at which the majority of the Conference may arrive without the assent of England can scarcely be considered binding, although it may possibly exercise a prejudicial influence. It may be taken for granted that Germany and Italy will give unqualified support to every proposal of the Russian plenipotentiaries. The policy of Austria is more uncertain, although there is reason to suppose that on some political questions the three Imperial Governments have agreed to act in concert. France, which might be expected to incline to the side of England, is embarrassed by traditional hostility to maritime pretensions which have in modern times been only partially abandoned; but as France is now, as formerly, more powerful at sea than her great rival and possible antagonist, there is some probability that the French delegates will be instructed to discourage the discussion of maritime laws of war. It may be hoped that the French Government will not be tempted by consciousness of its revived military strength either to favour provisions for the benefit of invading armies, or to interfere with the commerce of neutrals. It was Germany, and not France, which objected during the late war to the trade in arms and military stores. Those parts of the Russian programme which are concerned with exclusively humane objects will probably be adopted by the Conference with little objection, as they will be in the nature of declaratory enactments. The Emperor ALEXANDER, like his predecessor and namesake, may probably have been influenced by benevolent motives in proposing measures from which he may incidentally derive political advantage. The Holy Alliance originated in a kind of religious enthusiasm, as the Brussels Conference is due to a benevolent impulse. Lord DERBY inherits the insular cynicism which prevented Lord CASTLEREAGH and the Duke of WELLINGTON from sharing the sublime aspirations of ALEXANDER I. As the Italian MINISTER for FOREIGN AFFAIRS significantly suggests, the English Government has at all times hesitated to swim with the philanthropic current of Continental opinion. Such measures as the suppression of the slave-trade and the emancipation of the West Indian slaves are of course attributed by foreign critics to calculating egoism.

FRANCE.

MARSHAL MACMAHON'S tour in Brittany is the event of the day in France, and is no doubt of great interest to the MARSHAL and of some interest to the Bretons. The rest of France probably does not pay much attention to it. The estimation in which the PRESIDENT is held by a large number of his countrymen may be judged from the fact that those who wished to show that he was a greater man than was usually considered made much of being able to assert that he thought of this tour all by him-

self, and that no Minister aided in the conception of the bright idea. Possibly the MARSHAL was not aware that he was doing anything very remarkable, or that it required anything like genius to conceive the idea of going to look at the West of France. He goes about this new duty, as about all his duties, in a simple business-like way, works very hard, gets up very early, sees everything, says little, and exchanges the proper compliments with the local officials. Fortunately he has not got to tax his brains in order to make political remarks. He has one thing to say whoever may address him, and he says it. If a Bishop asks him to remember the ties that connect France and the Papacy, he replies that the Septennate is going to last seven years. If a Mayor or eminent commercial person observes that something definite in politics would be acceptable, he replies that the Septennate is going to last seven years. If complaints are made of the unsatisfactory proceedings of the Assembly, and hopes expressed that the MARSHAL may see his way to getting a new Assembly of a better type to support him, he replies that the Septennate is going to last seven years. It is a simple way of avoiding delicate questions, saves thought and time, and has the enormous merit of being exactly as good an answer to one person as to another. No one appears to be either dissatisfied or satisfied with the PRESIDENT, or to have any strong feelings about him or the Septennate. The towns of Brittany are Republican, although the country population is Legitimist, and in some towns there were as many cheers for the Republic as for the PRESIDENT. In fact, as those who were labouring to collect information for the public had not much material at their command, they appear to have chiefly devoted themselves to testing the quality and amount of cheering which was bestowed on the MARSHAL personally, as compared with that which the name of the Republic awakened. The Paris papers have not been condemned to silence or forced to give an official colouring to their statements, and they have freely characterized the reception given to the PRESIDENT as warm, or cool, or icy, according as their private information or political prejudices induced them to write. The MARSHAL and his Septennate have probably got not much good or harm by this tour in Brittany, but, so far as any effect has been produced either way, harm has been done rather than good. He has made it clear that if he thinks the Septennate a definite, intelligible, comfortable sort of government, there are very few who share his opinion, although they have not any objection to him personally. One candidate has indeed ventured to come forward as an avowed Septennatist, and Marshal MACMAHON ought to be very proud of such a man. But his announcement that the Septennate exactly suited him, that he believed in it, and longed to support it, was immediately received with a storm of ridicule. All parties agreed that to belong to the wrong party was disreputable and dangerous, but they also all agreed that to believe in the MARSHAL and his Septennate was something worse—it was simply ludicrous. The author of a scheme of government who finds that his very first convert is crushed under a load of bad jokes can scarcely be consoled by ascertaining that, if he goes to the provinces in official state, he will receive decorous official reception.

While the PRESIDENT is away, his Ministers have still got to attend to current affairs at home and abroad. In the Duke DECAZES he has a very prudent and capable Foreign Minister, who steadily pursues a moderate, sensible, and liberal policy. The Duke has been questioned by the Permanent Committee as to the recognition of Spain, and his answer was as good an answer as could have been made. France was not inclined to take the initiative or to act alone in recognizing Spain; but, when invited to act in concert with other great Powers, it would not stand aloof. It wishes to show that it is prepared to take such a place in Europe as circumstances permit it to assume, and to cultivate friendships and alliances by being ready to act in concert with its neighbours when invited to do so in any reasonable manner. Duke DECAZES had also the courage to avow that he did not wish to see France put in a false position by seeming to associate itself with the Carlists more closely than England or Austria has done. Germany has remonstrated against the assistance or connivance which the French authorities in the neighbourhood of the Pyrenees have extended to the Carlists, and the French Government has denied that it has been in fault. But, if it had been backward in recognizing the Government of SERRANO, it might have been suspected of not being friendly to SERRANO'S

enemies, and this was a suspicion which the FOREIGN MINISTER thought it prudent to avoid. He has indeed made up his mind at last that France ought to do something more than not help the Carlists; and perhaps it may be set down as one of the natural consequences of the formal recognition of the Madrid Government that a French gunboat has been despatched to prevent supplies to the Carlists being sent across the Bidassoa. The duration of the Carlist struggle has been in a great measure due to the distrust of its own navy entertained by the Spanish Government. It is properly the business of Spanish vessels to prevent arms and guns being sent by water to the insurgents. But the Government of Spain, although it has a navy, has not a navy that it dares to use; and so the Carlists have really had the command of the sea. Still it cannot be within the scope of the duties of a friendly neutral to allow its frontiers to be made the base of military operations for a rebel army; and whether the Spanish navy does its duty or not, France will do what her Foreign Minister conceives she ought to do under the circumstances, and will stop supplies going to the Carlists from France. In much the same spirit Duke DECAZES has allowed it to be expected that before very long he will remove a cause of offence which has much vexed another neighbour of France, and that the *Orénoque* will be withdrawn from the waters of Civita Vecchia. The presence of the vessel in an Italian harbour would have been a matter of no moment had it not been originally sent and kept there as a protest against the treatment which the Pope has received from Italy; and Italy has strongly represented to France that to let the *Orénoque* stay on now is to raise a suspicion that France is not sincere in its declaration that it accepts the facts which Italy has accomplished. This is so obvious that the *Orénoque* would have been recalled long ago only that the Legitimist party attach very great value to keeping alive this one ground of quarrel with Italy. The French Government has now apparently come to the conclusion that it is no use trying to conciliate the Legitimists, and that the pursuit of a frank and loyal policy towards Italy is not to be abandoned in deference to a party which, whether it is conciliated or not in this way, will do all the harm to the Government of the Septennate that lies in its power.

In the sphere of home politics the chief incident has been the discussion raised by some members of the Permanent Committee as to the prosecutions at Marseilles. The MINISTER OF JUSTICE explained that he, and he alone, was responsible for these prosecutions. Although in some of the cases nearly four years have elapsed since the alleged crimes were committed, yet he thought it essential that crimes so terrible should not, if they had been really committed, go altogether unpunished. He had done his very utmost to ensure that no one should be prosecuted for any acts which, under the widest extension of the term, could be called political. But, to the best of his belief, there had been many murders and robberies committed which had been entirely apart from the triumph of this or that political party. Marseilles, both during a great part of the German war and during the struggle with the Commune, was in a state of anarchy, and it was only at last, by the employment of an overwhelming military force which made all notion of resistance hopeless, that order was restored. It would be a fatal precedent, in the opinion of the MINISTER OF JUSTICE, if deeds of bloodshed and pillage were allowed to be perpetrated at such a time with perfect impunity, and if murderers and robbers were to be free from the consequences of their crimes simply because one political faction happened to be uppermost in the district at the time when their crimes were committed. The Republican members of the Permanent Committee were quite entitled to insist that the prosecutions should be shown to be free from all political bias. It is very easy, especially in France, for a triumphant faction to wreak its vengeance on those whom it has conquered, by wholesale punishment under the forms of justice. But if it can be made clear that the Marseilles prosecutions are really not in any way political, no set of people ought to be more grateful to the Government for undertaking these prosecutions than Republican deputies. The great difficulty under which their party labours, is that its history is associated with the performances of every kind of ruffians. That a Republican Government means murder and pillage is the notion which keeps very many Frenchmen from believing that a Republic can ever be anything but a disgraceful Government to live under. That Republican revolutions in France have often been accompanied by atrocious crimes is a matter of simple

history, and nothing could be more fatal to the Republican party than that the belief should be generally entertained that murder and pillage are the inseparable attendants of a Republican Government, and are viewed with indifference, or even approval, by Republicans, so long as the murderers and robbers will but take the trouble to kill and steal to the tune of "Vive la République!"

VAGARIES OF THE BRITISH ASSOCIATION.

THE British Association, which has done so much for science, would have been better advised if it had, as in its earlier years, strictly confined itself to its proper object. Mathematicians, chemists, physiologists, and astronomers ought to hold themselves apart from projectors and theorists who frame vague generalizations for the purpose of deducing economic or political results. The discussions of the Section over which Lord O'HAGAN presided at Belfast would, even if they had led to sounder conclusions, have had nothing to do with science, which means the systematic knowledge of natural processes. Even the most inveterate devotees of the study of crotchets must have been startled by the energy of the ingenious ladies who on one day, after Aristophanic precedent, occupied the place of meeting to the almost entire exclusion of the less enthusiastic sex; yet the feminine assertion that education was not only a science, but the first of sciences, was only an exaggerated form of the assumption that expediency, convenience, and the ordinary conduct of human life are subjects of scientific inquiry. The innocent economists who deprecated the coinage of half-crowns because there are only eight half-crowns in a pound were under the impression that there was something especially scientific in decimal calculation, although they had not succeeded in understanding the distinction between coinage and money of account. The British Association may reasonably take notice of the fact that men have ten fingers, and that consequently they have constructed a system of decimal arithmetic. Whether florins or half-crowns are best adapted to the purposes of the market and shop is a question for retail dealers and their customers, rather than for arithmetical professors. The Social Science Association, whatever may be its substantive merits, has a use of its own in providing a receptacle for the rubbish which collects round the outskirts of scientific inquiry. Guesses, fancies, and hobbies might be advantageously relegated to the domain of a Society which has nothing better to do. The reporters explain the injudicious laxity of the managers of the British Association by the perfectly credible statement that the Economic Section attracts the largest and most popular audiences. Demonstration, deduction, and induction are laborious employments of the mind; and only regular students of science understand the technical language in which it is necessarily taught. There is no difficulty, except that of fixing the attention, in following a sermon or a discourse on education.

If the collection of materials without method could be accurately described as a scientific operation, the proceedings of the Economic Section might furnish some curious illustrations of psychology. Nothing is more odd than the propensity of practical men to exalt the results of special experience into general propositions. Sir GEORGE CAMPBELL, in the course of a distinguished career in Indian administration, has necessarily been familiar with systems of land tenure utterly unlike the forms of ownership which are known in England or in Europe. Not sharing the prejudice of those who think that the English distribution of property is necessary and universal, Sir G. CAMPBELL jumps to the more baseless conclusion that it is intrinsically artificial and unsound. It is strange, and yet intelligible, that a mind of more than ordinary acuteness should be deluded by the mistaken liberality of the British Association into the belief that his theories of land tenure have any connexion with science. Sir G. CAMPBELL's paper commenced with the whimsical proposition that property in land is not properly called property, but privilege. The custom of primogeniture is, as he contends, a proof that the ownership of land was originally regarded as an office or public function. On this fantastical ground he is opposed to the subdivision of property, while with unconscious inconsistency he proposes to promote tenant-right, which, as far as it extends, must be a usurpation of the official duties of the landlord. If England

were an unoccupied country, about to be settled under the control of a benevolent despot, lucubrations such as those with which Sir G. CAMPBELL amused the Economic Section might perhaps have some practical use. The rent of land might be reserved by the State, or apportioned among elected or hereditary functionaries, while the occupiers might be secured in the enjoyment of their allotments for longer or shorter periods, or perhaps in perpetuity. It might be a curious inquiry whether the title to a little freehold is a property or a privilege, or, in other words, whether possession is inalienably burdened with a trust. Londoners, like the rest of mankind, are undoubtedly subject to some kind of moral responsibility for the use of their property and their opportunities. In England, whatever may be the case in India or Utopia, their land is their own in the same sense as their money.

Historians and jurists have in recent times thrown much light on primæval notions and customs relating to the tenure of land; but those of them who combine common sense with learning are not disposed to substitute archaic practice for the results of modern civilization. In other and more legitimate departments some of the greatest authorities of the British Association have maintained the theory that complex organizations have in all cases arisen out of simpler forms. In political or economic development there may sometimes be retrogression rather than progress; but on the whole the presumption is in favour of the latest results of the longest experience, and there is a probability that each separate community has adopted the system best suited to itself. If Sir G. CAMPBELL attaches any but a figurative meaning to his definition of property in land as a privilege, he must imply the existence of corresponding duties; and it would be difficult to contend that either privileges or duties could be, except under definite restrictions, the subject matter of purchase and sale. If a landed estate is a honeypot, there must be some check on the simoniacal bargains which would substitute incapable buyers for competent vendors. Sir G. CAMPBELL appears not to object to the hereditary devolution which provides no sufficient security for the discharge of public functions. Although investigations into the origin and principle of landed property have a certain attraction for speculative intellects, the difficulty of introducing any change in the system which would not involve great injustice is practically insurmountable. The conversion of absolute ownership into fiduciary possession will perhaps become more probable if the process of accumulation is carried to excess. The owner of a county becomes in public estimation a kind of public functionary, who may be compelled by opinion, if not by law, to provide within certain limits for the welfare of his dependents. For this reason the concentration of landed property in fewer and fewer hands tends directly to impair security of tenure. The nobles and petty princes of the middle ages were in many respects more absolute than the monarchs by whom they were afterwards superseded. Modern potentates themselves admit that they have duties as well as rights.

Theorists who propound arbitrary doctrines on the subject of property in land often forget that all proprietary rights are equally the creation of law. If the owner of some thousands of acres is merely the incumbent of an office held for the benefit of the community, the possessor of a million in personal securities can claim no exemption from similar liabilities. It has been truly observed that the owner of a five-pound note has practically the power of enforcing service from his fellow-creatures to the value of five pounds. The mortgagee of lands is not less responsible for the expenditure of the interest which he receives than the mortgagor for the mode in which he disposes of the residue of the rent. Both, either in their own persons or through their predecessors, acquired their absolute or qualified rights for pecuniary consideration; nor can they, as long as the present order of society exists, be justly expropriated, except for some special public advantage and on payment of due compensation. Socialism, or the community of property, is an intelligible and consistent system; and it is the only logical alternative of proprietary right. Those who are not disposed to promote the equal tenure of all things in common will act wisely in regarding property as an ultimate fact. If the public interest requires a modification of the conditions on which any kind of property is held, the owners ought to be paid in full for any sacrifice which may be demanded. The speakers who followed Sir G. CAMPBELL in the discussion dilated on the operation and principle of the Irish

Land Bill, which has hitherto furnished the only precedent for transfer of property by legislation. In that case it was contended by the promoters of the measure that it was necessary for the security of the country, and also that the landowners would receive compensation by the removal of dangers to which they were exposed. Arguments of this kind, whether or not they are sufficient, are legitimate and relevant, and they bear no relation to the fundamental doctrines of property. Mr. GLADSTONE himself would have failed to command the support of the House of Commons if he had professed to found the Land Bill on scientific principles.

THE NEGRO DIFFICULTY IN AMERICA.

THE troubles which now attract attention in several of the Southern States of the Union have long been foretold by foreign observers, though they have hitherto not impaired the cheerful confidence of native politicians. The rashness which Americans display in the conduct of public affairs may be explained both by circumstances and by the national character. The unequalled prosperity of the United States, and the apparent immunity from bad consequences which has been found compatible with political recklessness, have naturally produced excessive reliance on popular institutions and on resources which may well seem inexhaustible. The evils of a restrictive commercial policy are reduced to the lowest point in a vast country teeming with various productions; and the universal indifference to the qualifications of legislators and administrative officers is almost excusable where new laws are seldom wanted, and where every local community governs itself. The characteristic confidence of the Americans in themselves and in their favourite theories was confirmed and increased by the successful termination of a civil war which had at first seemed both to themselves and to the rest of the world to threaten the disruption of the Republic. The victory, though it had only been attained by enormous efforts, was finally complete; and it proved not merely that twenty millions were more than a match for eight millions, but that the citizens of the Northern States were determined to sacrifice fortune and life rather than the unity of the Federation. The policy which was to be pursued towards the conquered States was at first in doubt. The general feeling was in favour of magnanimous forbearance to the defeated enemy; but at the same time the dominant party was inclined to be lavishly generous to the freedmen, who were regarded both as dependant clients and as useful allies. Notwithstanding the fanaticism of philanthropists a moderate course might perhaps have been adopted, if an incapable President, raised by accident to his high position, had not foolishly provoked the antagonism of Congress to a mode of treatment which was intrinsically not unwise. Mr. ANDREW JOHNSON, who succeeded to the Presidency on the death of Mr. LINCOLN, had been elected Vice-President in reward of his adhesion to the cause of the Union, and partly because, having been a journeyman tailor, he retained the manner and modes of thought of his early life. It soon appeared that a Southern American of humble origin felt no sympathy with the political pretensions of the negroes. Assuming, by an explicable blunder, the absolute power which had been conceded to his predecessor during the war, the PRESIDENT affected to grant premature amnesties to the late enemies of the Union; and consequently Congress, in resisting the usurpation, was naturally induced to reverse Mr. JOHNSON's policy.

By an amendment to the Constitution, carried in the absence of Senators and Representatives from the States which had belonged to the Confederacy, every State was prohibited from inflicting disfranchisement or disability on account of race or colour. The vulgar demagogues who led the Republican party in the House of Representatives, including Mr. THADDEUS STEVENS and General BUTLER, expressed an opinion, which was widely prevalent, that universal suffrage was not so much an instrument of government as a weapon of defence. The Abolitionists, of whom Mr. SUMNER was the most conspicuous, had already, by listening to the echoes of their own declamation, become convinced that the negro was morally and intellectually the equal of the white American, and that he was equitably entitled to compensation for the sufferings attendant on his former condition. Between them the fanatics and the demagogues carried by irresistible majorities the measures which are now producing their inevitable results in the Southern disturbances. The PRESIDENT, who, in comparison with his

triumphant opponents, seemed accidentally almost to have risen to the rank of a statesman, was overwhelmed with obloquy; and the impeachment which was promoted by the Republican leaders would have terminated in his penal dismissal from office, but for the creditable firmness of a few Republican Senators who refused to yield to popular clamour. The capacity and honesty of the House of Representatives was about the same time illustrated by a nearly unanimous vote in favour of a partial repudiation of the National Debt. On the question of defrauding the public creditor the PRESIDENT agreed with his fiercest assailants; but the Senate, not for the first or last time, interposed between the Lower House of Congress and national disgrace. During the debates on the political enfranchisement of the negro, the Republicans contended that the coloured race was entitled to protection, and that the only mode of satisfying the claim was to enable the freedmen to protect themselves. It was not unreasonably believed that public functionaries elected by negroes would be devoted to the interests of their constituents; and it was not thought necessary to inquire whether the coloured voters, after providing for their own security, might not encroach on the rights and liberties of their former masters. By a grave though intelligible mistake all persons who had exercised civil or military functions under the Confederate Government were rendered incapable of office; and consequently the white population, at the same time at which it was swamped by the admission of the negroes to political power, was deprived of its natural and accustomed leaders.

The negroes were, as might have been expected, amply provided with political guides in the form of Northern adventurers of the lowest type, who saw the opportunity of making their fortunes at the expense of the citizens of the Southern States. A manager of conventions and elections in any part of the United States is not an admirable specimen of humanity; and the "carpet baggers," as they were called, were as much more unscrupulous than the Northern members of their profession as a South Carolina negro is stupider and more ignorant than an Irish inhabitant of the city of New York. South Carolina and some other States rapidly attained the ideal condition which has in Europe long been the dream of Red Republicans. All the taxes were levied on the whites and spent by the blacks, or rather by the impudent strangers who administered their political power. In other States rival Governments and Legislatures contended in arms, or in the ante-chamber of Washington, for opportunities of tyranny and extortion. On the other hand, the more lawless part of the white community organized armed bands, which sometimes committed atrocious outrages on the negroes, with the result of alienating the sympathy of the respectable part of the Northern population from the oppressed victims of Republican misrule. The Ku Klux organisation has of late been apparently either suspended or dissolved, and the conflict of races and factions is becoming more exclusively political. The Senate has unwisely increased the irritation which prevails by passing, in compliment to the memory of Mr. SUMNER, the Civil Rights Bill, which purports to secure social equality to the negroes in all parts of the Union. The Bill had not become law before the adjournment of Congress, and probably it will not be revived; but the vote of the Senate has tended to inflame the resentment and dislike which have been caused by experience of negro domination. The final issue of the struggle has never been doubtful. It is impossible to maintain, except by external force, the supremacy or even the equality of an inferior race, which is also in the whole of the Southern States a minority of the population. Dispassionate critics, who were condemned by philanthropists as heartless partisans of oppression, from the first warned Republican legislators in vain that the ambition which they strove to implant in the negro was dangerous if not suicidal. It was certain that the Northern community would ultimately sympathize with its own countrymen rather than with the objects of temporary patronage and benevolence. The Southern whites will have no difficulty in re-establishing their predominance when they and their political allies form the majority in the Union. Some political symptoms seem to indicate the approaching decline of the party which has now directed the policy of the United States for thirteen years. The return of the Democratic party to power would not be an unmixed advantage; but a coalition of Democrats and Liberal Republicans might perhaps not be found so useless in 1876 as it proved through the absurd selection of Mr.

GREELEY in 1872. A Republican Convention which has nominated Mr. HARTRANFT as Presidential candidate also denounced the project of a Canadian Reciprocity Treaty and the principle of Free trade. The large section of the Republican party which is interested in the removal of protective duties can scarcely co-operate at the next election with the Protectionist manufacturers of Pennsylvania and New England. New political combinations will facilitate a change of policy towards the Southern States; but, even if the Republican party should retain its unity and its predominance, there is no danger that a second Hayti will be established within the territory of the Union.

If the Americans are rash in incurring political risks, they have also a remarkable aptitude for redressing the evils which they have carelessly produced. They have apparently not been cured of their superstitious belief in universal suffrage, either by the condition of the city of New York under the rule of FISK and TWEED, or by the spreading anarchy of the South, with its KELLOGGS, and BROOKSES, and MOSESSES; but it was found possible to send TWEED to the Penitentiary, and in all probability the nuisance of negro domination will ultimately be abated. A large proportion of the difficulties with which it will be necessary to grapple was inherent in the relation of the two races after the inevitable abolition of slavery. By a long succession of costly experiments the true medium between chaotic equality and oppression may perhaps be ultimately discovered. Enthusiasts who disregard all distinctions of colour are not aware that they supply a posthumous justification of the slave-trade. Negroes who are supposed to be equal to the best citizens of European descent ought to rejoice in the vicarious sufferings by which their ancestors purchased the extraordinary elevation of their race. More temperate observers acknowledge that the coloured politicians of the Southern States have made a great advance on the condition of their indigenous kindred. Jobbing, and repudiating, and rioting are more civilized occupations than slave-hunting for the Zanzibar market, or participation in Ashantee customs. Even the right of voting might be comparatively innocuous if the negroes elected rulers only for themselves, and not for their betters. Universal suffrage, which is a rude and cumbersome instrument even when it is unavoidable, becomes absurd and intolerable when the constituency is not practically homogeneous. The example of Jamaica illustrates the inconvenience of representative institutions when the franchise is either confined to a white minority or extended to a coloured majority. It remains to be seen whether order and civilization in the Southern States can be reconciled with the retention of any share of electoral power by the coloured population. The politician who may provide for the security of the negroes against oppression, without allowing them a mischievous and unnatural predominance, will deserve a high place among American statesmen and legislators.

JOVIAL SOBRIETY.

WHILE Parliament is sitting people do not live much beyond ninety, and are, indeed, thankful if they are allowed to attain that age without question. But directly the prorogation has taken place, the aged have a much better time of it, and centenarians, as they are called, are plentifully and easily produced by rival villages. The miseries of mankind also increase very conspicuously during the vacation, and those who got on well enough before now indulge themselves freely in having "pests." There is a pest of ants in one place, and a pest of grasshoppers in another, and a pest of wasps in a third, and each locality in turn feels a proper degree of British pride in its special misery. In such a state of things, when the mind of man has run down, and dulness reigns uncontested, the public speaker who offers an assortment of even moderately good jokes is a benefactor to his race. Strange to say, a benefactor of this type has appeared in a most unexpected quarter. The prophet of fun has arisen in the dismal Gath of Teetotalism, and Sir WILFRID LAWSON without beer has been much more amusing than most men with it. He welcomed in his grounds no fewer than ten thousand 'Good Templars and Rechabites, and there, with this vast assemblage of damping enthusiasts before him, with those awful beings, "the local leaders" of temperance, ready to address everybody in the most serious language, with nothing to stimulate himself or his audience, many of whom have been "Babies of Hope" from their cradle, and to their dying day will

never quaff a cup of kindness, he stood in the open air in the middle of the vacation, and made a series of jokes, many good, some very bad, and all amusing. How the centenarians, if there had been any there, would have congratulated themselves on having lived to see his day! and even the people with the ants and grasshoppers and wasps would have forgotten for a moment the splendour of their respective calamities under the influence of his radiant good-humour. Of course he knew, and they all knew, that Good Templars were laughed at, but so was ELISHA. They certainly did wear very curious dresses, which they are pleased to call regalia, while Sir WILFRID LAWSON himself preferred combating intemperance in a shooting-jacket; but there are, as he urged, men of such a cast of intellect and character that they cannot combat intemperance with any effect or satisfaction unless they put on regalia. He could not quarrel with them, for they were, as he said, but copying the clergy, who find it convenient to put on a special kind of dress in their great conflict with evil. And some consolation of this sort, some concession to the weakness of human nature, seems necessary with the Good Templars, for they have a perilous turn for backsliding, and need much to keep them straight. Sir WILFRID LAWSON had the courage to say that he felt sure that, although it was a Good Templars' meeting, yet if he invited the meeting generally to liquor up with him, the invitation would be widely accepted; and this appalling statement was received with laughter. It went home to their hearts, and they laughed to think how true it was. But they knew they were safe; for a man is, as Mr. CARLYLE long ago pointed out, the creature of his own clothes, and the most inconsiderate man would shrink from liquoring up while he had got regalia on. Sir WILFRID LAWSON can, indeed, be the apostle of sobriety in a shooting-jacket. But that is because he is an exceptional man. He is merry without priming; he is jocose by nature. He has the fun of life without beer to aid him. But his Good Templar brethren are not so fortunate. They have a very dismal time of it. They spend their pleasantest hours in listening to collections of statistics about the vices of other people. They have got into that state of calm despair in which they would rather hear a local leader than not. All that is left to remind them that they are still in the "warm precincts of the cheerful day," is their regalia; and the cruellest publican cannot really grudge them this one solitary pleasure.

The worst of it is that, even with their regalia to help and console them, the Good Templars and Rechabites do not do much good. They are not, perhaps, exactly the sort of persons to do much good; and when Sir WILFRID LAWSON observed that although there were no born drunkards, there were many born fools, he must have felt that his remark might be taken by many among his audience as unpleasantly personal. They might, as their host with his jocose common sense explained to them, picnic every day, and pass resolutions, play music, wave banners, and sing temperance songs; but unless they did something else the publicans would laugh them to scorn. The question was, what else they could do. Little trumpet half-measures came to nothing, and every attempt to try them had ended in disappointment. First, workmen's clubs were to be the universal panacea; but that remedy has been tried over and over again, and the publicans have already beaten the clubs out of the field. Then it had been proposed that workpeople should agree only to drink at meal-times. But Sir WILFRID LAWSON knows the beeriness of human nature much too well to put any faith in such a broken reed. If the suggestion were adopted, he felt sure there would be a great many meals in the day. People would, he said, carry bread and cheese in their pockets so as to have a perpetual excuse for a glass. Something might indeed be done if the great regalia notion could be turned upside down, and if the drinkers of beer were forced to wear appropriate regalia. If those who proposed to drink were required to take out a licence stating the amount of their intended consumption, and had to wear this licence in the sight of all men, the effect would be startling. Even that device, however, might fail, for here again Sir WILFRID LAWSON's fatal knowledge of human nature came in, and he owned that these badges of intoxication might win more hearts than they would alienate. "Fancy a half-barrel man, going about; how popular he would be in Cumberland." Or fancy a three-bottle man. Sir WILFRID LAWSON was sure that a man of that mark would get into the beer

Parliament without a contest, and when he got there he would be so highly respected that, if they did not make him Prime Minister, they would be sure to make him a Bishop. It is scarcely necessary to say that this facetious sally was received with much laughter on the part of the Rechabites, who probably think more of the local leaders whom they know than of Bishops of whom they know nothing. As all minor expedients were, in the opinion of this laughing philosopher, perfectly useless, since human nature would have beer if it could, the only thing was to take care that it should not be able to get beer. The shape in which Sir WILFRID LAWSON wishes to see this crushing of human nature accomplished is the very illogical and inadequate one of the Permissive Bill. If in one parish human nature is deprived of its beer, he is content that in the next parish it should have as much beer as it likes. He would probably reply that he only aims at what he thinks he can get, and that to make even one parish sober is a gain. But does he really believe that he has any chance of getting even the little that he asks for? "In 1872 the clock," he said, "struck BRUCE; in 1874 it struck CROSS; when did they intend that the clock should strike LAWSON?" When, indeed! It is a clock that still wants a very great deal of winding-up.

Sir WILFRID LAWSON appears to treat the Permissive Bill very much as his friends treat their regalia. It would be absurd to make so much fuss and, after all, look no different from any one else. He must have something to show, and his bit of ribbon and tinsel—if that is an adequate description of regalia—is a piece of legislation about as imposing and unsubstantial. With a shooting-jacket and a merry heart, and a draft Bill in his pocket, he goes on his pleasant way, fighting intemperance to the utmost. But he is very far from being a tomfool, and it may be doubted whether he believes in his own regalia more than in the regalia of other people. The publicans who can laugh at picnics, and resolutions, and banners, can also laugh at the clauses of an imaginary Act of Parliament. Although he is laughed at, Sir WILFRID LAWSON will no doubt persevere. But his humble friends are no more inclined to fall below the standard of ELISHA and give in because they are laughed at than he is. They will go on with their picnics, and resolutions, and waving of banners, just as he will go on with his little Bill. The Bill and the regalia are equally symptoms of the state of mind in which men who get excited over a subject too big for them, and want to do something great to promote their own views, insist on doing something of any sort rather than do nothing and wait, and go on lamely and quietly like the unenlightened. It is precisely the same state of mind that prompts zealous Catholics to go on pilgrimages in the latter part of the nineteenth century. They burn to do something great for the cause of the Church, and rather than do nothing they will go off to a shrine where they really are not clear that a miracle was not once wrought. Mr. COOK lends them their regalia, and off they start in their thousands. The more they are laughed at the more they feel like ELISHA. The world may laugh the wrong way some day. Who knows what will happen? There may be another miracle, and this time a good, honest, demonstrable miracle, wrought at the shrine, and then how true it will be that he laughs best who laughs last; just as it may happen that the half-barrel men of Cumberland will be suddenly so smitten with a love of regalia and of beerless picnics that the publicans will have to shut up shop in despair. Meanwhile anything is better than humdrum quiet, and regalia and visits to shrines inspire at least the pleasant sense of doing a little more than nothing. The lovers of quiet practical stay-at-home religion are made uneasy by pilgrimages, and those who see in the spread of education, and the gradual conquest of barbarism, the only cure for drunkenness, look on the Permissive Bill and beerless picnics as little more than well-meant child's-play. But if there are any people who thoroughly despise mere unenthusiastic good people, it is pilgrims; and if there are any people who thoroughly despise those who hope to stop drunkenness by education, it is Sir WILFRID LAWSON and his guests. It is a controversy settled, not by argument or ridicule, but by the natural bent of the mind; and as people get in a free country more and more accustomed to follow out their private fancies, we may be sure that there will always be many persons who, in some of the different shapes which varying fashion suggests, will feel and gratify their natural craving for relics and shrines, or for regalia and draft Bills.

CHINA AND JAPAN.

A THREATENED quarrel between China and Japan is a symptom of the vast processes of change which have supplied to the present generation an unprecedented variety of political experience. Both States had long been regarded as strange and almost unintelligible instances of an ancient and stagnant civilization. The trade of China was valuable both to the East India Company while it enjoyed a monopoly and to the merchants who eventually succeeded in removing the former restrictions. In Japan, according to popular legend, the Dutch were allowed a limited intercourse on condition of tramping on the Cross; and it was more certain that all other foreigners were absolutely excluded from the kingdom. The extraordinary aptitude of the Japanese for the adoption of novel practices and modes of thought could by no possibility have been anticipated, even if the remarkable literature of which only a few specimens have been since translated had been known to foreigners. The Chinese also have been profoundly influenced by the results of two unsuccessful wars. Although their Government still struggles to evade the recognition of the Western Powers as equals, the Chinese have begun to pay the barbarians the compliment of constant imitation. They employ an English officer to collect their Customs duties; and although local interests have hitherto been strong enough to prevent the introduction of railroads, the Government of Peking has made great efforts to provide weapons and military stores of the most improved modern patterns. The tenacity with which their traditions of empire have been preserved has not been relaxed as the military resources of the Government have increased. After the capture of Peking by the English and French armies, the Taiping rebellion for a time seemed to threaten the existence of the reigning dynasty; but as soon as the Imperial armies were placed under the command of a capable English leader, the insurrection was totally suppressed. The Mahometan Turks of the Western provinces who supposed that they had finally thrown off the Chinese yoke now find that the Imperial power is once more becoming irresistible. Part of the lost territory has been already recovered; and the ruler of Yarkand will probably find difficulty in maintaining his independence. If the Chinese, who are naturally indifferent to danger, once succeed in organizing their forces after the European fashion, their enormous numbers will render them extremely formidable. It was always difficult to believe, except in a vague and careless manner, that three or four hundred millions of people acknowledged the authority of a single Government. Except by a great superiority of arms and discipline, no existing State would find itself a match for China.

The Japanese came within reach of Western influences much later than their neighbours; but they have since made far more rapid progress. The chivalrous sentiment of their romances, which is represented in their institutions by the singular practice of regulated suicide, seems to indicate the moral and perhaps the intellectual superiority of Japan to China. A still more remarkable quality was exhibited in the political revolution which immediately followed the admission of foreigners into the kingdom. The hereditary chief of a great feudal aristocracy was discovered to be a usurper, at the very moment when it became evident that it was expedient to concentrate authority in the hands of an undivided Government. As if by instinctive prescience of future political wants, the nation had held in reserve for nearly a thousand years a king by divine right, descended from the Gods, and indisputably entitled to the allegiance of all his subjects. An inchoate Parliament which was about the same time experimentally established has apparently not proved successful; and the people of Japan have the genuine political power of conforming their practice to the necessities and convenience of the time. It is difficult to estimate too highly the candid recognition of foreign superiority which has induced the Japanese Government to send students to Europe and the United States to learn arts which they may afterwards communicate to their countrymen. If the result has been in some cases to produce pedants and pretenders, the travelled revolutionists will find that their weakness is fully appreciated by their countrymen. It is highly probable that some of the innovations which have been adopted may have been premature, and that there will be occasional reaction. The mechanical skill and knowledge which have been acquired

are not liable to similar drawbacks. A nation which twenty years ago had probably not altered its system of ship-building or its armaments for centuries has already provided itself with ironclad vessels and with guns of the most advanced type; and native engineers have learned to manage European machinery. The feudal levies of the great provincial chiefs have been superseded by a regular army, which has acquired some rudiments of European discipline. The paradox of an elaborate civilization which seemed to be incapable either of progress or retrogression has made room for the most rapid advance hitherto recorded in history.

The Japanese Government will perhaps be sufficiently prudent to avoid an actual rupture with China. The expedition to Formosa requires no elaborate explanation, for the barbarous inhabitants of the island had committed numerous outrages on Japanese subjects. In answer to a remonstrance made by the Japanese representative at Peking, the Foreign Minister informed him that his Government was not responsible for the maintenance of peace and order in Formosa. The disavowal of responsibility may perhaps, in the language of Chinese diplomacy, be equivalent to a mere refusal of redress, nor is it improbable that the Japanese Envoy may have understood that the disclaimer implied no renunciation of sovereignty. English naval commanders have frequently inflicted punishment on local Chinese authorities for outrages on English residents or traders; and although, according to the terms of the existing treaty, all complaints ought to be preferred to the Central Government, the old practice has generally been found more effectual than any diplomatic communication. The Japanese Government sent an expedition to Formosa which seems to have met with little resistance, and it is not at present known whether a permanent conquest was contemplated. The Chinese have now insisted on the evacuation of the island, and, if the Japanese Government comply with their demand, the matter will be amicably arranged. As the Chinese navy contains no vessels which are capable of encountering the Japanese ironclads, it is possible that the invaders of Formosa may rely on their naval superiority; but it would be highly imprudent to commence hostilities with an enemy who will sooner or later inevitably prevail by mere force of numbers. The Chinese and Japanese are perhaps equal in military qualities, but the resources of China are inexhaustible. If it is not thought prudent to engage in a naval contest, the Chinese will find little difficulty in landing troops in Formosa, who will be supported by the native population. The territory and the harbours of Formosa might perhaps be valuable if they could be safely acquired, and the substitution of a more civilized race for the piratical inhabitants would tend to general advantage; but no acquisition of the kind could be worth the risk of a serious quarrel with China. If the Japanese navy is employed elsewhere in the repression of piracy in the Eastern seas, the commerce of all countries will be greatly benefited.

It is not known whether the Government of Japan has reasons of domestic policy for undertaking aggressive enterprises. It is highly probable that recent changes may have created discontent which it may be thought prudent to divert into the channel of foreign enterprise; and Japan is showing itself sufficiently like Europe to render conquest and military fame the most certain foundations of popularity. The national feeling, if it has been consulted by the Government, will perhaps be satisfied by the attainment of the original object of the expedition; and withdrawal in deference to Chinese remonstrances may easily be explained away. On the other hand, it is possible that the invasion of Formosa may have been part of a deliberate policy for gratifying the national ambition and forming an efficient army. It is impossible to foresee the immediate result of a war between Japan and China, though the greater Power would in the long run almost certainly succeed. It would be difficult for the Western Governments to remain indifferent to the injuries which would be inflicted on commerce and to the diplomatic complications which might probably arise. A war between two States which still remain outside the pale of European civilization would present some strange peculiarities. The national consciousness which makes the quarrel possible has been created by the novel modes of thought which have in both countries arisen from intercourse with foreigners. Before the late revolution the Japanese Government would probably not have thought it worth while to resent the cruelties which were perpetrated by the inhabitants of Formosa on shipwrecked

mariners; and the Chinese Government in its turn might have regarded with indifference a quarrel between the Japanese and the people of Formosa; nor would it have apprehended the annexation of one of its own dependencies. The Foreign Residents at Jeddo and Peking will not fail to exert their utmost influence for the prevention of war. If the contest proceeds, the trade in arms will flourish in both the belligerent countries, and probably the Japanese will show their full appreciation of civilized methods by contracting a loan. It is difficult to regard as aliens from the community of States nations which possess ironclad men-of-war and a national debt; yet the terms of a Japanese loan contracted for a war with China would probably be onerous.

SICILY.

EVERY nation has some thorn in its side, and Italy has more than one; but, of all its thorns, Sicily is perhaps the most troublesome. Sicily has had a melancholy history, and has been going downwards ever since it ceased to be the granary of Rome. It has been conquered, pillaged, overrun by its numerous oppressors, but never has had any good done to it; and its last holders before it was annexed to the kingdom of VICTOR EMMANUEL, the Neapolitan BOURBONS, adopted the simple plan of allowing it to do exactly as it pleased, and get on as it best could with its inveterate abuses, provided it yielded a handsome annual revenue for the KING to spend. From time immemorial there has existed in Sicily a peculiar species of brigandage, which is even now one of the greatest powers in the island. The brigands are not like the Neapolitan brigands. They do not form bands, and swarm about districts which they have made their own. They are part and parcel of ordinary Sicilian society, and seem to pursue the ordinary avocations of life in the four western provinces, and especially in the city of Palermo. When they are wanted by their chiefs to act they are ready, and meanwhile they do a large amount of robbery and murder on their own account in a quiet way, and with almost perfect impunity. If they commit smaller crimes they are, indeed, punished when they are caught, but if they go high enough in crime to be tried by a jury, they are acquitted as a matter of course. From time immemorial, also, the brigands have been the allies of the clergy; not always the political allies, for the brigands joined GARIBALDI with conspicuous enthusiasm, but the social and domestic allies, and now they and the priests are sworn friends, and hate with equal intensity the Italian Government. Formerly the Sicilian Church had a sort of independence of Rome, but since the proclamation of the Pope's Infallibility this independence has been abandoned, and the Sicilian priests are the obedient tools of the directing authorities of Ultramontaniam. The soil of Sicily is for the most part the property of great holders, and such cultivation as is bestowed on it is the work of peasants who live in towns and go out to labour for a few hours in the day. There are no villages, no farmhouses, and scarcely any roads, so that there is no rural population to withstand the brigands, or to be oppressed by them. The great proprietors have long been accustomed to live on very comfortable terms with the brigands and the priests, with both of whom they made satisfactory bargains. Were it not that Eastern Sicily is more advanced in civilization than Western, and that even in Western Sicily there is some sort of commercial life which asks the Italian Government to protect it, society in Sicily would be arrayed altogether against the Italian Government. And what troubles England with regard to Ireland also troubles Italy with regard to Sicily. A Constitutional Government must respect the forms of freedom, and as Sicily returns deputies to the Italian Parliament, these deputies, although politically they may not belong to the party in Sicily hostile to the Government, naturally seek to please their local friends by calling out that Sicily is enslaved, and oppressed whenever means adequately strong are taken to repress crime. It is not therefore to be wondered at that Sicily annoys and embarrasses each Italian Ministry in turn; and of no part of the Italian Kingdom is it more true than of Sicily that Ultramontaniam is for Italy a political danger, and not merely a proposterous creed, and that it means the central energy of a great force which is doing its utmost to shake off a civilization it detests, and to restore the beloved reign of every kind of abuse.

A writer in the *Revue des deux Mondes*, M. LOUIS-LIANDE, has collected from Italian sources many curious facts bearing on the recent history of Sicily. Before GARIBALDI arrived in 1860 to make Sicily the basis of those operations which were to end in imposing on Sicily the Government of VICTOR EMMANUEL, there was a state of things, even in the bad parts of the island, which had a strange outside show of order. The police were the brigands, and the brigands were the police; and there was a kind of organized robbery which made things not so very bad for those who had no choice but to submit to be fleeced. The public force consisted of what were termed "companies" of arms, relics of the times when each feudal owner had his retainers to fight for him and carry on his quarrels with his neighbours. The captain of a company undertook to be responsible for the peace of a district. If any very great outrage was committed, or if the injured person had sufficient social standing to call with effect for redress, the captain paid an indemnity. No one ever thought of following up the offender by any process of law; but if the criminal was one of the friends of the brigand police, the captain repaid himself by spoiling as quickly as he could some inhabitant of a neighbouring district, while, if the criminal was a stranger trespassing on the sacred ground of the company, then he was killed off at the first opportunity, and the Judge of the district—for the farce of having Judges was kept up—was merely informed that there had been a death, and no more trouble was taken. For eleven years the whole police of Sicily was under the direction of a first-class brigand, who, until he got excited by adverse political news in 1859, was the mildest of men, and made everything as comfortable as possible. There was a sort of security under his administration. Travellers paid to be safe, and they were safe. And it was only towards the close of this supreme police-brigand's reign that he lost his authority, because a brigand in a very inferior position ventured to try to assassinate him in open day as he was walking with his wife, and was allowed to escape with impunity. When GARIBALDI arrived, the brigands generally took his side, and, as a good way of showing their enthusiasm for his sacred cause, broke open all the prisons, and restored their suffering brethren to a liberty by which they profited so much that GARIBALDI's regiments were quite inconveniently full of convicts. But GARIBALDI was not the sort of man to let his followers pursue their own devices; and while his Dictatorship lasted he made the brigands feel they had a master. At last, however, the Italian Government took possession of Sicily, and behaved as a regular Government is bound to do. It introduced law and trial by jury, and reforms in the police and in the magistracy, and did its very best to put down brigandage by main force. But its success has been very imperfect, for the brigands gained more by having juries to try them than they lost by having soldiers to hunt them down. It is indeed most difficult to hunt brigands down in Sicily, for almost every one is a brigand or a friend of a brigand, and no one would dream for a moment of doing anything so unhandsome, so dishonourable, and so un-Sicilian as helping Justice to catch and punish a murderer. There is, too, a strong local spirit in Sicily, and the Sicilians are indignant that they have not Home Rule after their own fashion, and that strangers like the Italians persist in interfering and forbidding them to cut each other's throats. Sicily for the Sicilians is the cry of the brigands; and as Sicily for the Sicilians means Sicily for the Ultramontanes, it is the cry of the priests too, and the sort of treason which PRINCE BISMARCK so much dislikes is quite the fashion in Sicilian pulpits.

It is a bad state of things, but it must be said, in justice to the Italian Government, that it is a state of things which it has worked hard to mend. General MEDICI, one of GARIBALDI's companions, was sent to Palermo in 1868, and for four years held the chief civil and military authority in his hands, and made even the brigands respect him. But there were loud outcries against this unconstitutional union of the civil and military powers, and it unfortunately happened that some of the leaders of the Parliamentary Opposition who had joined in these outcries came into office, and had to see the result of their clamour in the resignation of General MEDICI, and in things getting much worse in Palermo since he left. The Palermo brigands tried the experiment in 1866 of an open outbreak against the Government, and for about a week the city was in their hands. But when a sufficient number of troops could be collected, the insurgents received so severe a lesson that

it will be with very great hesitation that they will again openly defy Italy. If Italy went to war and encountered disasters of any kind, a Sicilian insurrection would be a certainty. But, as things are at present, there is more of a sullen opposition to everything the Government does than risk of a violent catastrophe. The law is looked upon as a foreign and evil invention by the true Sicilian, and he resists it as much as he dares, and gains glory and social esteem by the amount of resistance that he ventures to show. If a new law is introduced which is distasteful to the brigands and the priests, it is simply ignored, unless the penalties of disregarding it are too heavy. The people of Palermo for the most part decline to go through the form of civil marriage, without which the religious ceremony has no legal effect. The Government can make their children illegitimate in point of law, but it cannot make them marry otherwise than as they please. In fact, it is not those who are at present confronting it that the Government can hope to do much with, or reduce to order and obedience. It is obliged to look to the future, to educate children, to make roads, to improve ports, to lay the foundations of a new era of material prosperity. It has done much more in this way for Sicily than could have been expected, considering the great disadvantages under which it has to work. It has built a great number of schools, and got a fair proportion of children to attend them; it has spent large sums on public works; it will soon open up the interior of the island, which is at present almost unknown to the dwellers on the coast; it is making Palermo an excellent commercial harbour, and a very considerable commercial centre. In the meantime, if it only will abolish trial by jury and give up all attempts to govern Sicily according to Sicilian ideas, then, as M. LOUIS-LANDE says, there may be hopes for Sicily even in this generation. He invites his French readers to look at Ireland and see the happy effects produced there by Coercion Acts. Perhaps Irishmen would not think the comparison complimentary; but it is only when foreign critics examine carefully into the difficulties under which government is often actually carried on that they can recognize that measures must often be taken which Liberal Governments honestly regret.

THE PLIMSOLL COMMITTEE.

IT is satisfactory to observe that Mr. PLIMSOLL and his Committee do not intend to abandon their efforts to provide greater securities for the safety of merchant crews at sea; but we cannot help being rather afraid that between the Committee and the Royal Commissioners there is some considerable danger that, in the end, matters will be left pretty much as they are. The PLIMSOLL Committee have published a reply to the Commissioners' final Report, in which they dispose of many of the arguments of the Commissioners in favour of allowing the owners of ships, in the interests of commercial liberty, to do pretty much as they please with their ships and crews; but they are certainly less successful in justifying their own proposals for ensuring the safety of vessels. It is unfortunate that the Commissioners concentrated their attention too exclusively on the supposed necessity of allowing shipowners to run any risks they choose in order that they may do as much business as possible. Shipowners may be trusted not to neglect any opportunity of extending their profits; but they are apt to forget that waste of life cannot be considered a legitimate expenditure, and it is on this side that some pressure requires to be applied to them. At present it is the practice of all the more respectable shipowners to subject their vessels to a periodical inspection, in order to ascertain whether they are seaworthy; and Mr. PLIMSOLL urges that this inspection should be made compulsory, and that ships which are not registered by LLOYDS or one of the other surveying Companies should be surveyed by the Government. To this the Commissioners reply that a Government survey would be a bad thing, because it would destroy the shipowners' sense of responsibility, and also because it would lead to a bad system of shipbuilding in future. This argument is obviously of too sweeping a character, and, as the PLIMSOLL Committee point out, would strike not merely at a universal survey but even at the partial survey by the officers of the Board of Trade, which is already enforced in certain cases. Under the Act of last year 294 ships were surveyed down to June 30, and 281 of these ships were condemned; but, according to the

view of the Commissioners, it would have been better to have left these unsound ships alone, and to have allowed the owners to send them to sea on their own responsibility. Moreover it would seem to follow that, if the Commissioners are right, the whole course of recent legislation in regard not only to ships but to mines, factories, and houses, is injurious in its influence, as tending to destroy the responsibility of owners, and to promote a dangerous style of construction.

The PLIMSOLL Committee, while exposing these fallacies, fail on the other hand to see that the most substantial objection to a compulsory Government survey is founded on practical expediency rather than on principle. There are already great differences between the rules of the various surveying Companies as to the conditions of seaworthiness, and it is not desirable that the Government should interfere with a system of its own. Moreover there is an indirect as well as a direct way of exercising compulsion, and in this instance the indirect way is at once the simplest and likely to be the most effectual. The absence of a certificate of survey might be used against an owner, in the event of any disaster happening to his ship, as a proof of carelessness or neglect on his part, and a ground for compelling him to pay heavy damages. It is urged by the Commissioners that, if there were a load-line beyond which no ship should be permitted to be loaded, everybody—even those who did not already load as low as that—would be tempted to load quite down to the line, relying on the assurance that it was perfectly safe; but the Committee answer that the shipowners are at present free to do that, "and worse." Honest owners understand that, for their own sake, it is not desirable to load too deeply, and they would no doubt be guided by the same considerations whether there were a fixed line or not. Besides, if the line were a safe line, there would be no danger in loading down to it. Here again the answer is sound enough in itself, but scarcely touches the right point, which is that it is impossible to have a fixed line adapted to all vessels, and that there will always be differences of opinion as to what constitutes the true line of safety.

The demands of the PLIMSOLL Committee have an appearance of simplicity which will be found to be somewhat delusive. All they ask, they say, is that ships needing repair shall be repaired, and that ships shall not be overloaded; and this seems at first sight reasonable enough. The difficulty is to determine what are necessary repairs, and at what point overloading begins. If the Government were to undertake to regulate these matters in all cases there would inevitably be some risk of error, and the burden of responsibility would be shifted from the owners to the Government officials. There are so many different kinds of ships that it is practically impossible to lay down any absolute rule which shall apply equally to them all. Moreover, if any rule were laid down, ships would probably be constructed so as to comply with its formal requirements without reference to actual security, the builders and owners being screened by the Government rule. Here again the most effectual method of dealing with shipowners who are likely to be careless as to the safety of their ships is not to prescribe minutely how their ships shall be built and loaded, but to make them responsible for the safety of the vessels, and let them know that, if anything goes wrong, they must expect to suffer for it. As it is, the class of honourable shipowners voluntarily do all they can to protect their crews; and shipowners of a lower class would understand the advantage of doing so too if they were aware that every disaster which might happen through carelessness or recklessness would be visited on their heads, or, to take a more sensitive part, their pockets.

The mistake which seems to us to be made by the Committee is that, while the ends which they seek to secure are excellent, they are on the wrong track as to the means of attaining them; and as long as they obstinately persist in advocating impracticable measures, and in refusing to be satisfied with anything less than a compulsory Government survey and a fixed load-line, they are only playing into the hands of those who desire that nothing should be done at all. Self-interest is one of the most powerful influences in the world, and the great object should be to make shipowners who are disposed to think more of freights than of lives feel that it is their own interest to take good care of their crews. We have repeatedly pointed out that, of all the persons concerned, the common seaman is the one who has the keenest interest in the safety of the ship.

The owner is covered by his insurance, the underwriter sets particular losses against the general profits of his business, and the captain, too, is probably tempted by the prospect of a bounty, or by a share in the speculation, or perhaps merely by a desire to ingratiate himself with his employers, to play a desperate game. But the seaman has little else than his life to care for, and may be trusted to do his best for it if he is only supplied with the means of ascertaining whether the ship for which he is engaged is sound, and of making his grievances known. It is very seldom that unsound ships are deliberately sent to sea in order that they may go down, and it is not in these cases that loss of life usually occurs. Nothing can be more absurd than to describe shipowners as if they were exceptionally wicked and inhuman. They are just the same as other men, and what happens in the shipping trade is only what happens in all trades. In the press and haste of modern competition there is a natural tendency to force the pace, and to try to make as much out of everything as possible. The old way of doing business was to avoid risks, and to stick to safe, steady transactions; but the fashion has changed, and all sorts of risks are now freely accepted on the assumption that, if business can only be pushed to the utmost extent, there will be sure to be a sufficient margin for losses. Credit, for example, is given with reckless facility, and a large allowance for bad debts is part of the regular course of trade. The recklessness of the shipowners is of a similar kind. They certainly do not want to lose any ships or drown any crews if they can help it, but they have unfortunately got into the way of taking these things rather too easily, as if they were ordinary and inevitable risks. This is a bad habit of mind, and it is well that something should be done to shake them out of it. It may indeed be hoped that one result of such legislation as has already been tried will be to correct the thoughtlessness which is in a large degree the source of the evil. What is needful is that shipowners should be made to feel that loss of life at sea is something more than a common hazard of trade, and that they are bound to do everything in their power to reduce to the lowest point the chances of disaster. The existing law, as far as its objects are concerned, seems to go about as far as is expedient, at any rate for the present, but it manifestly fails in providing a sufficiently simple and effectual means of carrying out these objects. If Mr. PRIMSOLL and his Committee, instead of wasting time in the advocacy of impracticable measures, would apply themselves to the amendment of the existing law in the way of providing for authentic information as to the condition in which vessels leave port, and for prompt redress against careless or reckless shipowners, they would be much more likely to command the support of public opinion, and to serve the class in whom they are interested. As it is, they are simply supplying the opponents of all reform with plausible arguments against doing anything at all, and perhaps even for attempting to reverse what has already been done.

THE ABOLITION OF PRIVACY.

THE *New York Times* has made some sensible and opportune remarks upon what it calls the abolition of privacy. The condition of public opinion illustrated by the Beecher scandal is certainly calculated to suggest some unpleasant reflections. The evil is described very pithily in one sentence of the article. "The American citizen," it says, "who is coolly asked to submit for publication his opinion as to whether his brother is a scoundrel, or his friend a liar, or his friend's wife a shrew or a harlot, does not kick the inquirer down stairs; he does not even show him the door; he meekly complies with the demand." The *New York Times* knows better than we do what is the state of feeling of American citizens upon these matters. We would fain hope that things are not quite so bad as it describes, even in America; and they are certainly not so bad in England. Our interviewer is not yet a privileged being, who has a right to confess anybody, and then to make the confession public. And yet we are sorry to have to admit that there is some tendency even in England to disregard the rights of privacy, and that the disposition of newspaper reporters to interfere in matters which do not concern them grows stronger rather than weaker. To denounce the evil is easy enough; but, as usual, it is not quite so easy to suggest an effective remedy. When such a case occurs as that of Mr. Beecher the evil is flagrant; nobody can say a word on behalf of a practice which leads to such disgusting results. Mr. Beecher himself says very truly in his defence, "It is time for the sake of decency and public morals that this matter should be brought to an end. It is an open pool of corruption, exhaling deadly vapours." Mr. Beecher's interest in suppressing the discussion is too great to allow his words to have much weight

in the matter; but his sentiment may be fully endorsed by impartial spectators. The misfortune is, that whilst everybody protests, the very protests act as an advertisement. Some of the offenders may be impudent enough to urge that, as the matter is made public, at any rate they cannot afford to leave the dirty business to their rivals. Others may cover the same sentiment more decorously by saying that, as the imputation has been published, it is fair to the persons implicated that the minutest details of the apology should be published also. In one way or other there seems to be an active competition in spreading a disgusting story which, one would have thought, should have been kept as quiet as possible by the common consent of everybody concerned. When once the matter has oozed out, all the accumulation of disgusting detail follows by an inevitable process. Corrections become necessary; each correction involves a further imputation, and the imputation requires another answer; and so the controversy spreads and ramifies till every corner of the "cesspool" has been thoroughly stirred up, and its malodorous vapours have spread into every corner of the country. They do these things on a large scale in America, and we can only hope that the disgust caused by so flagrant a case may do something towards bringing about a correction of the evil.

But how is the evil to be corrected? The answer is not quite so clear as it may seem at first sight. Are we to say, for example, that such scandals should never be published at all? That would undoubtedly be a very simple remedy, but it is one which could scarcely be adopted without qualification. If a celebrated preacher or statesman is subjected to an imputation upon his moral character, it is clearly desirable that some discussion should be possible. When such matters come before a court of justice the rule is comparatively clear. In England, at any rate, discussions upon the merits of the case are postponed until the question has been decided by a competent authority which excludes irrelevant talk. One obvious moral from Mr. Beecher's case is that mischief invariably results when the functions of a court of justice are usurped by a number of unqualified amateurs. We heard enough in all conscience about Arthur Orton, but if the whole affair had been unrestrictedly discussed by newspapers, instead of being kept within certain limits by legal authority, the world itself would hardly have contained the literature that would have been generated. Trial by newspaper naturally implies the introduction of all kinds of irrelevant and irritating topics, and, it may be, of topics only interesting to a prurient imagination. If a well-known English clergyman had been prosecuted for immorality in a court of law, some bounds would have been set to public curiosity, and the duty of newspapers might have been defined by the limits thus imposed. Without, however, discussing this particular case, it must be admitted that there are cases in which newspapers may rightfully interfere, and where legal processes would be inapplicable. We cannot complain that people should be more or less responsible to public opinion. When it is lamented that the old fences of private life have been broken down, it is only fair to add that the conditions have been materially changed. In old days a man who lived in a country village had no fear of newspapers before his eyes; but he was under an active surveillance quite as irritating. His neighbours gossiped about every detail of his life; and scandal was not the less venomous because it was less open. The advantage of life in a modern capital is the great increase of personal freedom in such matters. We have no neighbours, and can do as we please in many affairs where we should elsewhere be in constant dread of annoyance. Nobody knows or cares whether the man who lives next door to him in a London street goes to church or passes Sunday mornings in drinking or sleeping. The same change has to some extent taken place in public life. A statesman lives in a larger sphere than formerly, and is not subject to the same minute inspection. A century ago Junius attacked the Dukes of Bedford and Grafton for their private vices in a manner which would not be tolerated for a moment at the present day. A man may occupy a conspicuous position in Parliament, and of thousands of people who read his speeches not one in a hundred may have any knowledge whatever of his private character. The rise and progress of the interviewer is not so much indicative of a radically new evil as of a reappearance of the old evil in a new form. The interviewer is the old village gossip revived on a colossal scale. He is endeavouring to restore in a magnified form the system of bondage from which we hoped that we had finally escaped. He is to the modern man of eminence what the girls at the fountain were to Gretchen in *Faust*. He is more terrible, in so far as it is more disagreeable to know that many hundred people are gloating over the details of your private life than to know that half-a-dozen neighbours are talking scandal; and he is less terrible, in so far as the readers are further off and regard you more as an abstraction than as a concrete and recognizable human being. On the whole, in such a case as that of Mr. Beecher, the new evil is undoubtedly worse than the old. The intoxication of celebrity in so vast a public is overpowering, and when the celebrity is suddenly changed to notoriety of the most unpleasant kind, the suffering is proportionally great. So conspicuous a man has not the refuge granted to more commonplace victims of losing himself in a crowd; and poor Mr. Beecher, whether innocent or guilty, must feel for the rest of his life that, wherever he goes, the eyes of an omnipresent public will be upon him, and that he will be enveloped in an impalpable atmosphere of scandal.

In proportion, then, to the possible greatness of the evil is the strictness with which the ordinary rules of private life should

be enforced. The Positivist rule, *vivre au grand jour*, was interpreted by Mr. Mill to mean that everybody should be at the mercy, in every detail of his life, of an organized public opinion of tremendous power; and he naturally inferred that such a system would imply the most crushing tyranny ever imagined. Nobody ever attributes any doctrine to Positivists without its prophets immediately demonstrating that the statement implies a complete misconception of Comte's most vital principles. We shall therefore only say that, if Mr. Mill were right, the modern interviewer appears to aim at carrying out a similar system, with this unpleasant difference, that, whereas on the Positivist scheme opinion was to be controlled by certain immaculate priests, the interviewer would be controlled by nothing but the taste of popular readers. To resist such a tyranny even at its beginnings is most essential, if newspapers are not some day to become an intolerable nuisance. And yet it must be admitted that it is not quite easy to draw the line between a legitimate and an illegitimate use of the power. There are many criticisms upon public men which are not only fair but essential to the preservation of a healthy responsibility. There is a misconduct which cannot be reached by law, and there are cases in which the law requires to be supplemented by general discussion. If then it is required to point out the precise line of distinction between a legitimate and an illegitimate appeal to public opinion, we can only reply that the distinction must be felt but cannot be defined. The same difficulty occurs every day. There is some gossip about his neighbours in which a gentleman will indulge; there is another kind of gossip by which he would feel himself to be defiled and disgusted. If a man asks to which category a particular story belongs, the only answer is that, if he is a gentleman, he will know by instinct; and that, if he is not a gentleman, he had better learn to be one as soon as possible. In like manner, there are questions which an interviewer may ask, and to which the interviewer may reply without any loss of dignity; there are others—those, for example, suggested by the *New York Times*—to which the only proper reply would be conveyed through the toe of a boot applied to the most convenient part of the interviewer's frame. To lay down a set of rules for defining precisely what a man of thorough self-respect and delicate feeling would feel and do on any given occasion is a task beyond the powers of any human legislator. And yet on any such occasion the instinctive answer may be as decisive and unambiguous as the answer to a mathematical problem. The nearest approach to a rule which can be given is that an interviewer should publish nothing which he would be ashamed to publish under his own name if he were a man of sensitive and refined feelings. Unluckily this is to prescribe a rule which is too often like telling a blind man that he ought to act as if he had a lively eye for colour. All that remains is to endeavour to apply the lash as vigorously as possible whenever the rule is broken by people who are sensitive to nothing but a lash. Even the most hardened interviewer is more or less vexed when he is told that he has acted like a blackguard, and by working on that little germ of feeling we may possibly in time establish a law which will enable us to keep these persons in order. And meanwhile it is worth noticing that the people who complain of these unwarrantable intrusions have frequently a chance of doing good service. If only some statesman would have the courage to kick an interviewer down stairs, and to tell an inquisitive public that he heartily despised their curiosity and would not condescend to administer the most trifling satisfaction to it, he would probably be astonished by the amount of sympathy he would excite. People are very fond of asking impertinent questions, and therefore it is too often assumed that they are gratified by compliance. But such questions are often asked out of thoughtlessness, and the asker despises the man who yields to his temptation. There is a charm even to the vulgar about a good resolute No, and if the man who gets a slap in the face seldom enjoys it, the crowd of spectators in whose name he acts are as much pleased by his discomfiture as they would be by his success. We should be glad to see the experiment tried, and we predict, not only a gain of respect, but even of immediate popularity to the man who will resolutely slam his door in the face of one of these Paul Pry's of journalism.

ULSTERMEN.

THE members of the British Association have had an opportunity this year of making themselves acquainted with a race which seems thus far to have received a smaller share of attention than it deserves. The typical Ulsterman differs so much from the Irishman with whom he is usually classed that to some of his recent visitors he must have appeared almost as a new discovery. The familiar *bragoo* so well known at the minor theatres, and even in the streets, of London, will have been missed. The rags and dirt, the begging and the ignorance, together with the gaiety and carelessness, expected as part of the true Irish character, will have been looked for in vain. In Belfast the so-called Milesian who figures largely in our police-courts is a mere colonist, as he is here. Such people exist there, and in larger numbers even than here, but they are not the natives. The true Ulsterman is quite another kind of being. Although he is clean in his personal habits, he wants the English neatness. His talents are neither for music nor for poetry, nor does he cultivate the arts. With him *ahrewdness* takes the place of wit, and though he does not, like the Scotsman, require the help of a surgeon before he can see a joke, neither does he, on

the other hand, like the Irishman, place fun before every other moment of enjoyment. He is often taciturn, yet seldom wants an answer. He never wastes a word, yet on occasion can speak with volubility. He is capable of sarcasm, yet on the whole despises the man who makes a joke without provocation. He takes his pleasures, like an Englishman, sadly, and is still more limited in their range and variety. He hates ceremony, and is often wanting in politeness, yet he will risk imprisonment to join a party procession, and is hospitable to a fault. His morals are not on a par with those of his fellow islanders, but religion is the very breath of his nostrils. He never forgets his Protestant principles, however seldom he may act on them. He heartily abhors and despises Papists, and prays to be delivered from the Bishop of Rome and all his detestable enormities. When whisky deprives him of his self-control he defies the police with a war cry which takes the invariable form of maledictions on the Pope. Yet he does not habitually indulge in bad language, and at the worst gives expression to his feelings only by the use of a monosyllable which he pronounces "dawn." He possesses also a form of oath which, allowing for the heinousness of all profane swearing, must be considered vague if not innocent. He asseverates a proposition with the mysterious sentence "By this and by that," whose depths of hidden meaning have not yet been revealed to the students of folk-lore. In the lower walks of life he is a Presbyterian, but as he rises in the social scale he prefers the Episcopal form of divine worship—in his heart, however, despising all ritual as savouring of Babylon, and sturdily refusing to permit the use of the cross either on the gable of his church or over the graves below. He always calls himself an Irishman, and is proud of the name; but his contempt for Irishmen of another province is supreme. The Hibernian side of his nature is chiefly shown in his sectarian vehemence; if he still oftentimes considers work to be derogatory to a born gentleman, yet he is industrious and frugal himself, averse to accepting alms, and proud of hard-earned success.

A nature so full of contradictions should be worthy of study, yet, with one or two exceptions, we cannot recall any books in which the character is described. The race itself is deficient in poetry as well as in music, and has not produced many novelists of note. The fairy mythology, the lore of semi-historical legend, is unknown to it; and one song, barbarous alike in words and in music, commemorates the ultimate fact in its history. The harp of Ireland has no place in Ulster. Drums and fife furnish it with the means of playing party tunes, and the "Protestant Boys" merits no better exponent. While the name of Belfast, which the Ulsterman contrives to pronounce in one syllable, represents to his mind the noblest commercial city in the world, the name of Derry awakens his whole patriotic sentiment. To him Derry is a sacred place; the Mecca of his religion. His aristocracy consists of the descendants of those who fought in the siege, and the man who can say he reckons one of King William's soldiers among his forefathers is in Ulster like a Hadji in Turkey or Egypt. So it comes to pass that with the most radical professions, he will vote as a Tory, and, upholding tenant-right, Presbyterianism, and personal liberty, is ardent in his loyalty and untiring in his denunciations of Republicanism.

His language, as might be expected from his origin, contains a curious mixture of component parts, gathered from Scotland, Ireland, and England, but moulded by his own individuality into a peculiar patois. It partakes, on the whole, more of the nature of the broad Yorkshire, such as may be heard in the dales, than of any other English dialect. But Scotch, and especially Lowland Scotch, enters largely into its composition. From Ireland it borrows its guttural, and, without any of the sweetness and softness of Munster, it has absorbed many southern peculiarities. The Ulsterman cannot distinguish "shall" and "will," nor does he object to such forms as "banes" for "beans," or "sowl" for "soul." How far this was the English pronunciation at the time of the colonization of Ulster we must leave to Mr. Ellis and Dr. Hume to say; but although in Down or Armagh it is not uncommon, it is by no means the rule. The pronoun "I" is habitually altered to "a" or "aw," and the vowel "u" has a sound analogous to that of the German "ü." The Ulsterman always says "ay" when he means "yes," and "man," which he pronounces like the German "*mann*," he applies with familiar indifference to all ages and both sexes. He begins every sentence with "I say," spoken very rapidly so as to sound like "assay," and he frequently softens his consonants or omits them altogether. There is, however, a business-like tone in his method of speaking, and those who have business dealings with him find that he carries it beyond a mere sound.

For the thoroughbred Ulsterman is as acute as the Yankee. He is no more to be taken in than a Scotchman. He is industrious in his habits, and hates idleness in others, and though he gambles with flax, one of the most precarious of all agricultural productions, he never depended on the potato for his food, and therefore suffered less from the effects of the Irish famine than any of his countrymen. He cared little for the Land Act, for as long as he paid his rent he had nothing to fear from eviction, but since it has passed he has availed himself of it to the utmost. The number of cases decided in Ulster since the Act came into operation is already said to exceed those of all the other three provinces, and there alone have the tenants bought their holdings to any considerable extent. He is law-abiding as a rule, but very fond of litigation, which he looks upon as a lottery in which he may win a prize. "To get the law" of a man is in his language to take an advantage of him, and while his conscience is very scrupulous as to worshipping graven images or admitting a crucifix into his house,

he will half kill a Romanist in a party fight, and at the subsequent investigation swear away his liberty with steadfast and unswerving determination. This party element enters into and defiles all his good qualities, and moderation in political or religious questions is hateful to him. If he dislikes Papists, he abhors "triumphers," and with all his frugality and all his industry will rather pay a heavy fine, or go to prison, than fail his lodge on the Twelfth of July, or hesitate to get drunk in honour of the "glorious, pious, and immortal memory of that great and good King, William III." The Party Processions Act, though constantly and even severely enforced, did not subdue this spirit in the least, and its repeal makes no difference whatever to him, unless indeed it robs his favourite amusement of some of its zest, and deprives him of a source of unfailing and perennial excitement.

But this is the darker side of the picture. The Ulsterman has qualities of the highest value in any nation. If he is not so careful and so steady as his opposite neighbour in Scotland, he exhibits a greater amount of social talent in several respects. His "wit" is not so dry, but it is more comprehensible. He is almost as well educated as the Scotchman, and even better able to make use of what he knows. He loves a laugh and a quick reply above all things, and is most mortified when he finds himself unable to cap a story. But his repartee is seldom ill-natured, and, though he will not, like a pure Irishman, risk open friendship for a joke, he despises the man who takes seriously what is meant in jest. He loves a delicate distinction, and is fond of learning new forms of expression. It was an Ulsterman who, when some one sneered at his cart, remarking, "One of your wheels is red and the other blue; they are not fellows," promptly replied, "No, they are not fellows, but they are comrades." It was a shrewd Ulster slater who asked the Evangelical nobleman why he provided tin-headed nails for his castle roof if he believed the world would come to an end in ten years. And it was an Ulster marquis who endeared himself to his tenantry by the memorable bull uttered in his speech at an agricultural dinner, "I wish my farmers would use iron ploughs, because they last for ever, and will afterwards sell for old iron."

It is, however, out of Ireland that Ulstermen have made the most of their talents. They are almost as fond of the way to London as the natives of Scotland. Nor do they fail when they go further. Ulster has furnished England with at least one Prime Minister, if not two, and India with a Viceroy as well as a whole Gazetteful of heroes. The Pottingers and Nicholsons, the Lawrences and Montgomeries, who have come from Derry or Down, are innumerable. They have left a mark on the world's geography as explorers, and, having furnished Franklin with his second in command, sent McClintock to find his bones, and McClure to discover the passage he had sought in vain. It is an Ulsterman who now presides over the deliberations of the House of Lords, and another who holds the terrors of the law over Ritualist curates from the Committee of the Privy Council. An Ulsterman from Belfast was but lately chief Minister of Canada, and another is now the Governor-General. An Ulsterman was with Nelson at Trafalgar, another was at Wellington's right hand at Waterloo. To say that Ulstermen are proud of themselves is to malign them. Pride is a vice to which, as Protestants, they cannot acknowledge, and it must be remembered that the only Irish Bishop on the English bench comes from the Northern province; but to say they are not proud would be to accuse them of ingratitude to Providence. We do not need to solve the difficulty here, and no doubt the members of the British Association have had it presented to their minds sufficiently often at Belfast. Conceit is the besetting sin of provincials, and it besets Ulstermen with remarkable success. Clever, independent, and usually endowed with great bodily vigour, they may be pardoned for a little of that *amour propre* which would be such a gain to the Irish of the other three provinces and elsewhere.

The one thing in which the Ulsterman contrasts least favourably with his brother Irishman is his want of poetry. Even when he would be pathetic he fails. It is true that a Belfast house issues annually the largest number of valentines for the use of the whole world. The Ulsterman can bring no skill to bear on the peculiarly Irish science of love-making. He makes his courtship a matter of business, but does not transact it with his usual celerity. He thinks more of what his intended has than of what he is. It was an Ulsterman who at a funeral observed the awkward work of an unaccustomed hand, and exclaimed, as he seized a shovel, "I was not seven years counting a sexton's daughter without learning to sod a grave." And, no matter how large the bride's fortune, he always grumbles over the marriage fee. "Wouldn't half-a-crown timplt ye?" asked a bridegroom of the officiating minister, when the clerk demanded the usual five shillings. On the other hand, his belief in destiny is unwavering. When a clergyman expressed his surprise that a husband should be found for an old and portionless woman, he was briefly reproved in the reply, "There's critters for critters." On a similar principle it is considered reprehensible to speak of any one as an idiot, and simply flying in the face of the Creator to call anybody ugly. Plainness is more delicately characterized by the word "ornary." An expected death is alluded to by the form, "We're waitin' on him"; and the nearest approach to poetical expression is illustrated by the story of a recent traveller in Tyrone, who, having inquired for the fisherman that had attended him in a previous expedition, was informed that he had died suddenly on the floor of his cottage—"the water that was boiled to make his tay shaved him when he was a corp."

OLD HOUSES.

IN some parts of England a chief place among the objects of an antiquarian ramble is held by the ancient houses of the district. This is chiefly the case in those counties or parts of counties which have not been swallowed up by large towns; and these districts again divide themselves, according to the material, into the regions of stone, timber, and brick. In a district like Northamptonshire or Somerset, which is neither a wilderness nor a province covered with houses, but which is full of small towns and large villages, and where good building stone is found in plenty, ancient houses of stone are naturally abundant. In the East of England, on the other hand, lack of stone drove men to the use of brick, and an English brick style therefore grew up there answering to the brick styles of Italy and Northern Germany. In the West Midland region again, neither stone nor brick, but wood, is the prevailing material; and any one who has studied the domestic architecture of Coventry and Chester knows that it is very far from being a contemptible material. Each of the three materials, stone, brick, and wood, has its own peculiar forms, but it is, naturally in the stone district that we find houses of the greatest antiquity and showing the highest forms of art. Still, in both these respects, we set a lower standard in the case of houses than we do in the case of churches. It is plain that, except in the very greatest houses and in their most dignified portions, it is impossible to reach the same degree of stateliness which is reached in a church of the second, or even the third order. And so with regard to date, the Romanesque houses in England may be counted on the fingers, while no one despises a house even of the seventeenth century. The great mass of our old houses belong to the fifteenth and sixteenth centuries; anything of the thirteenth or fourteenth is at once noticed as unusual. Of the few houses earlier still, most of the instances are to be found in towns, like the Jews' House at Lincoln, and Moysey's Hall at Bury St. Edmunds, buildings which have suggested a notion which is at least worth examining, that the oldest stone houses in England are always the work of Jews. Two of the oldest houses in England which are not strictly in a town are the ruined house at Christchurch and Morton Hall at Cambridge, but each of these, if not strictly in a town, is close under the protection of a castle. The truth is that the growth of the rural domestic architecture of a country is the best of all guides to the growth of its civilization. There is a stage where no man who is not great enough to be lord of a castle is safe anywhere but within the defences of a walled town. The undefended house in the open country is a sign that the law is strong, and that the master of the house is not afraid of any hostile attacks from his neighbours. This forms one of the points of difference between England and France. "Manor" is a French word, but it has become in use far more English than French. The English manor-house translates the French *château*, the use of the French word preserving a tradition of the time when the manor, as a rule, had to be a castle. That is to say, to live in an undefended house in the country was safe in England sooner than it was safe in France. For the same reason we lack in our English towns the stately private houses, often of ancient date, which belonged, and sometimes still belong, to the noblesse of the neighbourhood. That is to say, the French *seigneur*, not feeling himself safe except within walls, divided himself between his castle and his town-house at a time when the English knight or esquire could safely make his rural manor-house serve for both. Because the power of the law was thoroughly established over the whole country at an earlier time in England than anywhere else, we lose something in the way of castles and palaces, of town-houses and civic buildings, but we gain in that large class of houses on a moderate scale, dwellings of the lords of a single manor, which form a marked feature in several districts of England. In some parts indeed they are so usual and so marked that people actually know that they are houses; otherwise, as a rule, any piece of mediæval architecture which is at all fragmentary or found in an unusual place is vulgarly set down as a church, or at least as having had something to do with monks or nuns.

In the districts of which we speak the manor-house, now and then of an earlier date, but most commonly of the fifteenth or sixteenth century, is still found in many a manor, but it is not, as a rule, still dwelt in by its lord. As a rule, it has sunk into a farm-house. Nor is this very wonderful, for it is quite certain that no modern squire, and indeed no modern farmer, could make himself comfortable in a house of the twelfth or the thirteenth century, while it perhaps needs some little antiquarian turn to be quite at home in a house even of the earlier Tudor times. When the Elizabethan period is reached, no one need complain, but then, though picturesqueness of outline is in some respects increased, the purity of architectural style is past. Perhaps the luckiest man is he who comes in for a hall and a porch of the days of Henry the Seventh, with a few rooms added in the days of his granddaughter. The work of the two dates supplies variety without any real lack of harmony, and the grouping of the two parts of the house will most likely be better than if the whole had belonged to either date. In the earlier type of house there is commonly only one room, strictly so called, of any importance, namely the *solar*. There is not the same display of large windows and rich ceilings, though both of inferior detail, which we find towards the end of the sixteenth century. The hall still remains the great feature, indeed the only strictly architectural feature. The hall, ranging the full height of the house, with its open roof, with its oriels at one end and its screens and gallery at the other, is the great fea-

ture of the mediæval house, great or small, from the lowly hall of the smallest manor or parsonage to the pillared ranges of Oakham and Winchester or the vast spreading roofs of Westminster and Hampton Court. As manners changed, as the master of the house left off dining in the hall, the hall lost its importance. It became no longer a distinct architectural feature the full height of the house; it became little more than a large room with other rooms over it, and it gradually sank to be a mere entrance, a hall in the modern sense. But meanwhile the other rooms of the house were growing both in number and size; men were building houses so full of glass that it was hard to find a place in them out of the reach of the sun. The purity of mediæval detail was also dying out, and Italian elements were creeping in. A house like Montacute, with all its stateliness, is not so strictly a work of architecture as a house of a third of its size one hundred and fifty years older, which still keeps the hall as a distinct feature. But, on the other hand, now that we have developed the use of dining-rooms and of various other rooms of different kinds, it cannot be denied that a house like Montacute is much more convenient to live in. The lucky man, we again say, is he whose house, great or small, gives him something of both dates, where the hall of the fifteenth or sixteenth century is not unequally yoked to the living-rooms of the sixteenth or seventeenth.

It is to be noticed that, as the original use of the hall died out, the mere entrance to the house gained in effect. In the older type of house, where the hall is the main feature, the porch or other door does not open at once into the hall, but into the dark and narrow passage called the screens. The hall itself is entered only through the screen, but when the hall had sunk from dining-room and almost everything else into a mere entrance, the entrance naturally gained in stateliness. On the other hand, where space is an object, the entrance has again lessened, till by a caprice, or rather a survival of language, we often hear the word "hall" applied to a passage no wider or lighter than the screens which led to the ancient hall. The hall, in short, died out as the necessity for it died out. The manner of life which had once been usual in the castle and the manor-house died out before a new set of social ideas; the whole household no longer dined in each other's presence, and the common table, and with it the common hall, lived on only in institutions like Colleges and Inns of Court. There the hall still goes on, applied to its old purpose, while in those houses where it is still left it has become a drawing-room, an entrance, or nothing at all. Nowadays we should design buildings of very different plans for a college and for a large private house. In the fifteenth century one plan did for both. Professor Willis has pointed out that the ground plans of Haddon Hall and of Queen's College, Cambridge, were almost exactly the same.

In one main point our ancient houses, like all our ancient buildings, teach us a lesson which is for all time and for all styles. Every one has heard the story of a man who built himself a house with a very stately front, which looked remarkably well on paper, but who, when he went to take up his abode in it, found that his architect had forgotten the staircase. Such a mistake was not likely to be made either in mediæval or in Elizabethan times. The mediæval architect might make his staircase a mere corkscrew, and not according to the statelier and more convenient pattern which came in from Italy; but he was quite safe to make a staircase of some kind, as he was safe to make everything else which was really wanted. There is the key to one main difference between ancient and modern designs. A modern design for a house or any other building constantly gives one the idea that the architect first drew a picture which should look pretty, and especially which should look unlike anything else, and then divided it into rooms as he could. The house of Queen Anne's time, built in no particular style of architecture, has no claim to be picturesque; but it is solid and straightforward; and, because it is solid and straightforward, it is, if not exactly beautiful, yet not exactly ugly. Houses of this type are far less offensive than such as we see nowadays, where one says "I will be Italian," another "I will be Gothic," another "I will be Elizabethan," another "I will be something nondescript such as nobody ever saw before." All of them show a conscious striving at being picturesque, beautiful, eccentric, or something or other. The Queen Anne's house aims at nothing of the kind, and is so far better; but the earlier types are better still, in that without any striving they gain the objects which the modern architect strives after. The house-builders of the fourteenth, fifteenth, and sixteenth centuries simply built what they wanted in the best way that they knew how to build, and it came out picturesque and beautiful without any effort. A man wanted a hall, a chapel, a kitchen, a solar, a gateway, or anything else; he made them as he wanted them, in such relation to each other as he wanted them; he made the best doorways and windows and roofs that he knew how to make, and the design made itself. Out came Wroxhall or Chalfeld or Lytes Cary by a kind of natural selection. If he wished to equal or outdo the ancient builders, he must set to work in the same way. An ancient architect did not put a gable in this or that place simply to look pretty. He put his gable in the place where it was wanted and made it of the size of which it was wanted to be; but he also gave it the best architectural character that he knew how to give it, and thorough success was the result. In all this we cannot do better than follow the wisdom of our forefathers, and we may fairly follow them in their particular ways of doing things whenever those ways of doing things suit our own modern purposes. Take for instance the making of windows. The common sash window is confessedly ugly; so people nowadays run off to

bring in all the strange dodges which have come into vogue ever since there went forth a decree from Mr. Ruskin that all architectural forms which had been in any age used by Englishmen were for the future to be tabooed. But meanwhile the old-fashioned English window still abides, constructed on the principles of common sense, as the Ruskinian window is constructed on the principles of make-believe. Stick your glass in your mullions as your forefathers did, but learn something withal from modern experience. Had the mediæval builders known such a thing as plate-glass, they would have used plate-glass, and, using plate-glass, they would have put their mullions further apart. For some mysterious reason they cared less for fresh air than we do, and took less pains to make their windows open. But with a little care it is easy to reconcile ancient beauty with modern convenience, without running off into any of those fashionable dodges, those new developments of culture, which to plain English eyes seem neither beautiful nor convenient. You may make a straightforward mullioned window which the architect of Thornbury himself need not have despised, but which lets in all the light and all the air that any one can want, and which, instead of shutting out the view, shows it to greater advantage. Both in building and in politics there is nothing like the wisdom of our forefathers, if we only know how to make use of it. The models which they have left us are neither to be scornfully cast aside nor to be blindly imitated. We shall do best by doing as we may believe that they would have done in our circumstances, with our new needs and our new means of supplying those needs. At all events let us follow their great rule; let us build the thing which we really want, as we want it, in the best way that we know how to build it. If we follow our forefathers in doing this, we may come to raise such works as they did. But we shall never do so if we set to work on no principle but that of making each new building queerer than the building last before it.

THE PATHOS OF PLEASURE-SEEKING.

THE word pleasure-seeker, as any intelligent schoolboy would be able to tell us, is a compound built up of a French and a Teutonic element, which together denote the active pursuit of enjoyment. And the definition thus arrived at is favoured by a survey of the recognized use of the word in our standard literature. Yet an inquiring young foreigner, say some studious Oriental, who happens to be in our midst just now learning our language, might not improbably feel perplexity at hearing some of its frequent applications. If at the holiday season of the year he encounters at a railway station or in a steamboat a man looking particularly hurried and confused in the midst of his numerous progeny and their unmanageable baggage, he is told that this afflicted person is a pleasure-seeker. He will turn to his pocket-dictionary and no doubt feel a little puzzled. Possibly, attracted by rumour and by curiosity, he may visit one of the frequented resorts of the pleasure-seeking public with the anticipation of some species of gorgeous festivity, or possibly some potent influences akin to those of his familiar opiates disposing to a luxurious indolence. Yet here, too, perplexity awaits him. The goal to which were hastening the flurried, dust-begrimed, and fatigued travellers who excited so deep a feeling of pity in his breast appears to be anything but the sensuous Paradise he had been rash enough to imagine. Instead of the voluptuous ecstasy or serene delight which he thought was attracting this crowd of itinerants with something of a dreadful force, he finds for the most part indications of painful restlessness and ennui. Pacing up and down the elegantly constructed pier or esplanade there presents himself the same type of man that he recently found burdened with travelling afflictions. He looks much like a fine tiger in one of our menageries—confined, impatient, and morose. He occasionally resorts to newspaper or pipe, but neither proves a very effectual sedative to his perturbed spirit. His wife and daughter appear meanwhile to be deriving some degree of amusement from sundry promising acquaintances. Thus, then, exclaims the curious observer, these odd Englishmen take their annual draught of holiday pleasure. Elsewhere he may find examples of the same class of ardent and much tried pleasure-seekers looking for a realization of their dreams, not in stationary inaction by the dreary murmuring sea, but in some form of wild exertion. On the steep sides of Snowden or Helvellyn he may meet oppressed-looking persons panting and toiling upwards under a broiling sun, and his polite companion endeavours perhaps to explain to his bewildered intelligence that in this way British families are wont to disport themselves. Hardly less puzzling would appear to our imaginary learner the voluntary sufferings of well-to-do ladies and gentlemen in the steamboats which ply about the west coast of Scotland and elsewhere. Nor would he be much enlightened if he followed the comfortable obese middle-aged man to his untrod moor, and saw him helplessly sweltering and molling amid unknown bog and swamp, or if he accompanied some of the thousands who periodically overrun certain parts of the Continent, ignorant of the languages and customs of the countries they visit, and gloomily repining at the gross impositions to which they are everywhere subjected. Supposing our thoughtful observer of English habits to try, in a Socratic manner, to make an induction from all these varieties of pleasure-seeking, of the central idea contained in them, it is easy to see what a hopeless perplexity is likely to possess his mind. In no one of these quaint devices of the pleasure-seeker can he recognize any familiar ingredients of human enjoyment; and perhaps he might ultimately conclude that the practice of

autumnal flitting to sea and mountain is a survival of some ancient religious ceremony, by the self-imposed sufferings of which the worshipper is supposed to propitiate certain august deities presiding over the more imposing phenomena of nature.

An interpretation of our annual excursions so little flattering to our intelligence and civilization would, without doubt, be indignantly resented by every true patriot. And it would be easy indeed to retort to our fictitious visitor's exclamations of surprise that modes of enjoyment vary with national temperament, and that an Englishman studying the festivities of Japan or China would often find it as difficult as he has done to detect the sources of pleasure. This answer has no doubt some degree of force. Many forms of English amusement spring immediately out of the robust muscular activity of our race, and to a body well-braced and teeming with spare energy, a stiff day's walk, an ascent of some savage mountain peak, a tiring scramble through stubble or swamp, may bring a keen relish not conceivable to the more luxurious temperament of hot climates. So strong a characteristic, indeed, is this love of action, that the richest sensuous impression may fail to convey high pleasure unless there has been eager and arduous exertion in pursuit of it. Thus it is, for example, that people who have rarely troubled themselves to note the majestic splendour of a lowland sunset will burst into raptures at the like spectacle when they happen to have toiled up Snowdon or the Rigi in order to witness it.

Yet, allowing the full force of this rejoinder, it strikes one that there is still ample ground for the naïf perplexity of our supposed visitor. For in very many cases, we think, the poor plagued pleasure-seeker who excited his compassion would himself be ready to confess the utter vanity of his aims. Nay more, some few would be inclined to admit frankly that they had no expectation of deriving any pleasure from this custom of autumn trip. The professional man, for instance, who in week subjection to his family obligations consents to wander forlorn for several weeks over the sandy shore which happens to suit the fondness for society of his sisters or daughters, is only an apparent pleasure-seeker. The two sexes have sometimes totally dissimilar conceptions of enjoyment, and the resort which offers abundance of amusement to women whose greatest daily excitement is a dinner party and the promenade may be insufferably dull to their devoted protector. This is but one form of that singularly overlooked variety of modern hardship, the subjection of men and may perhaps be obviated when the idea of the value of individual liberty shall have penetrated the regions of the domestic relations.

Not only so, but even in the case of the uncoerced pleasure-seekers who start on their autumn ramble of their own free will, the art presents its melancholy aspects. People rush from town to mountain or moor in the full belief that unimaginable delights await them. They are *bona fide* pleasure-seekers. Still, when one lights on them in the hours of fruition, they seem anything rather than the enviable partakers of the highest human felicity. It would be easy enough, no doubt, to moralize on this gloomy fact, and to point out how illusive are all the anticipations of mankind. (Or one might attempt, more philosophically perhaps, to explain how it is that so few pleasures come up to our ideas of them, and to show how large an ingredient of most of our enjoyments lies in the very act of anticipating and pursuing them. But, leaving these more ambitious aims, we may content ourselves with indicating one or two special reasons for the frequent fruitlessness of this annual search for pleasure.

These failures to realize an annual felicity seem to be due to the great liability of a person nowadays to pursue his pleasure in a manner unsuitable to his capacities and habits. It might be said, no doubt, with some amount of truth, that few Englishmen possess a keen capacity for prolonged gratification; and certainly we betray, in comparison with some other nations, a striking absence of individual originality in planning new and fitting schemes of enjoyment. But, apart from these permanent hindrances, we may call attention to a number of influences which seem to concur just now in exposing people to this risk of illusion. One of these is obviously the new opportunities of travel afforded by the improved facilities and increased cheapness of travelling, and by the greatly altered distribution of wealth, both of which are a part of the industrial progress of the age. By reason of the latter, people are continually finding themselves in possession of money for which they have never before had occasion to discover uses; and as the advance of our railway system is ever bringing them new temptations to extended touring, there is little room for wonder that so many novices set out on the difficult paths of travel. The plain uncultivated citizen finds perhaps his usually quiescent imagination inflamed by brilliant handbills setting forth the proximity of Paris, the Rhine, and Italy. In an evil hour he yields to the importunate enticement and sets out on his foreign tour. Ignorant of the languages, modes of intercourse, and habits of life of the cities he visits, he soon discovers these unsuggestive surroundings to be unbecomingly and inhospitable. He has not the requisite culture to enjoy works of art, or to derive pleasure from observing the habits or studying the history of the people he visits; and he very soon wearies of the incessant jargon, and with a deep conviction that all foreigners are the leagued foes of the British tourist, he returns miserable and embittered. We remember once falling in with such a simple tourist among the warm beauties of Venetian architecture. By some strange freak he had set out from the Black Forest, the original aim of his excursion, for that city, being impressed apparently by somebody's description of its glories. He was able to endure the swift succession of Church

visitings, with the French or broken English of the *sacristani*, for three days only, and his look of weariness and despair when we last saw him was something unspeakably touching. Fifty years ago persons who entertained the plan of a foreign tour studiously prepared for it, and were possessed of the knowledge and culture fitted to profit by the plan. But, in spite of compact handbooks and manuals of conversation, the modern tourist too often finds the adverse forces of his new environment too much for him. Much the same thing may be seen among the less opulent classes. They are constantly inveigled into pleasure-trips for which they have little fitness. The simple bucolic whom one occasionally sees at a watering-place may serve as an illustration. He wanders, like some sad shade, with the equally gloomy forms of his wife and children, over the wide waste of sands, and looks moodily out on the harvestless sea. His mind is unprepared by reading and information to take interest in the new objects which present themselves. The sea has no poetical associations, no suggestions of beauty, of mercantile profit, or even of thrilling disaster, for his imagination; and with thoughts still chained to the fields and cattle of his daily care, he longs for the evening train which is to bear him back to his familiar haunts.

Closely connected with these industrial changes are other and social changes which help to explain the luckless choice of amusement made by so many people. The gradual transformation of the social system from an aristocratic to a plutocratic basis is accompanied by the imposition of a growing number of artificial criteria of rank. The natural and inimitable test of birth being gradually superseded, a code of new and stringent rules comes to be enforced, compliance with which is supposed to establish a person's competence to enter and adorn a certain grade of society. These tests are naturally directed before all other things to pecuniary capabilities, and hence the increasing number of necessary extravagances under the burden of which so many people groan. Thus we find that hardly anybody who wishes to maintain an unambiguous social position is really at liberty to choose his mode of spending his autumn. The man on 'Change or the professional man who is anxious to keep well with his watchful neighbours, learns from his wife or daughter that this fashionable English watering-place, or that Swiss valley with its splendid hotels, is considered the thing for the season, and, however much he might prefer a quieter and less costly resort, the force of social calculations proves too much for him. From this it follows also that in the eager attempts of persons to wedge themselves into a slightly higher stratum of the social formation, they so frequently seize on the favourite amusements of that higher level. Whether it be the successful Liverpool speculator who tries somewhat late in life the vigorous pleasures of the chase, or the New York aspirant to social recognition whom one so often sees ignorant and helpless, trying desperately to draw a little enjoyment from the European tour which is to float him safely into the desired haven, or the cleverly advertising West-End tradesman who takes a box at the opera and feels compelled to doze away a certain number of evenings in this bright portal to a higher sphere, we see in all cases alike the same sorry kind of pleasure-seeking under the force of a dominant ambition for social elevation. The impulse to earn the esteem of one's fellows, though it be only for pecuniary attainments, is no doubt a worthy one, and it ought perhaps to be regarded as a mark of social progress that so many people are ready to sacrifice personal gratification to considerations which have some altruistic elements in them. Yet one can hardly help feeling a touch of pity for the persons who thus try to delude themselves into the belief that they are in search of pleasure, and who are ready to commute the few opportunities of intense enjoyment which life offers them for the chances of another nod of recognition or two from fashionable equipages.

ROMAN REMAINS AT LYDNEY.

NEARLY two years ago (November 2, 1872), in a notice of Murray's Handbook to Gloucestershire, we glanced in passing at the existence of curious and important Roman remains on the north-west bank of the Severn, as well as on the opposite side of the river and county, round about Cirencester, and we pointed to the association of the name of Bathurst with the preservation of both. The Woolhope Field Club—which does not, as is slanderously reported, limit its researches to the edibility of toadstools and puff-balls, but takes a lively interest in the antiquities as well as in the natural history of Herefordshire and its confines—has this year paid a visit to Lydney Park, the seat of the Rev. W. H. Bathurst, and the site of a far more extensive Roman occupation than many of our antiquaries and archaeologists imagine. Unhappily by tourists, though not exempt from the neighbourhood of tall chimneys and the shriek of the railway whistle, Lydney Park stands beside the road from Gloucester to Chepstow, within an easy mile of the little town which gives it its name, on beautifully undulating ground at the outskirts of Dean Forest, and commands a grand outlook on the broad estuary of the Severn, and the Stinchcombe Hill and Vale of Berkeley on the other side of it. To the sketcher and lover of the picturesque its glades and uplands offer sylvan scenery of singular beauty; and whether he regards the hale and magnificent old oaks and Spanish chestnuts, or the plane, service, and other fine-grown rarer trees near the mansion, or yet again the small-leaved limes which, in the precincts of the remains of the Roman camp, villa, and temple, have bent their massive lateral branches to the earth only to start up afresh with new roots and a hardy independence of the parent stem, the arboriculturist

might deem himself fortunate were he fixed for a week or more within reach of so attractive a field for his special study. At one time his path will be across a rich sward, the fertility of whose soil is attested by splendid timber; at another beside limestone rocks through crevices in which straggle roots and trunks of trees; whilst in the dell below trickles a tiny brooklet to complete a scene which the common folk believe to be a demeane of fairyland. At the extremity of the park, about two miles from the mansion, are vestiges of the old Roman mines and ironworks, known here, as at Coleford and Bream in the region of Dean Forest, as the "Scowles." A writer on Dean Forest surmises that "scowles" is a corruption of the British word 'crowl' = caves; but it is obviously safer, with the veteran antiquary, Mr. Thomas Wright, to confess utter ignorance of the "unde derivata," albeit the verb to "scowl," which in one sense is to "look red and hot," might suggest an etymology for want of a better.

The Scowles, whencesoever named, designate uneven ground composed of cinder-heaps and sparse vegetation, and occasional copse-wood, hard by the entrance of an ancient Roman iron-mine. They are not uncommon in other parts of Dean Forest, and one such may be visited by Wye tourists in the neighbourhood of Symond's Yat. But that which renders Lydney Park almost unique in its interest is that, apart from this trace of Roman occupation, almost every square foot of it attests the former presence of the civilizing conqueror who inspired those he subdued not only with something of his industry, but also of his refinement and cultivation. Two camps of considerable strength and importance show it to have been a first-class military station of the Romans, commanding the Severn, and covering, according to the Hand-books, some eight acres. The larger of the two is of an irregular oblong shape, 830 ft. long and 730 ft. broad. It is single-ditched on all sides but the east, where, as the ascent is less steep, the ditch is twofold. The lesser camp is single-ditched and round. Within the entrenchments of the larger of the two, which lies to the right of an undoubted Roman road communicating with Caerwent, the father of the present owner, Mr. C. Bragge Bathurst, sometime Chancellor of the Duchy of Lancaster, and a kinsman of Lord Sidmouth, was the first to discover and excavate the remains of a very considerable Roman villa or palace, with commensurate offices and adjacent buildings. To summarize a note of Dr. Ormerod to his elaborate paper on the "British and Roman Roads leading to Caerwent" (*Archæological Institute Proceedings*, Bristol, 1851), the excavations disclosed the foundations of an irregular quadrangle, the sides of which averaged two hundred feet, exclusive of offices to the north-west, and of a palatial fabric on the north-east side. This latter had a portico along the west front, and an open court in the centre, surrounded by corridors in which, as well as in several chambers, occurred tessellated pavements, two of which were uncovered for the inspection of the Woolhope Club on their recent visit. To the north of this building and detached from it are hypocausts of considerable extent, the system of flues beneath the floors of the chambers above being distinctly traceable, although it would be too much to say that there is any extant proof that these chambers were bath-rooms. Here, too, are tessellated pavements of elaborate pattern, one of which was uncovered as a type of the rest, and which have remained carefully covered and preserved since their excavation by the first investigator, who had the forethought to treasure up the coins and numerous relics found on the spot, and to have plans and drawings executed, amongst which were engravings of no less than eleven tessellated pavements.

We have yet to speak of that part of the principal quadrangle which is most interesting to the classical antiquary—namely, the traces of a temple, 95 ft. long by 75 ft. broad, from inscriptions and votive tablets in which may be gleaned at least the probable name of the owner and his seemingly Romano-British tutelary God. According to three inscriptions found in this temple and preserved in Mr. Bathurst's interesting museum on votive tablets, this God was named Nodons, Nodens, or Nudens, and there is fair reason for supposing that he was a local British deity, adopted, after their accommodating fashion, into the tolerant Pantheon of the Romans in Britain. Old-fashioned readers will remember how forcibly Paley points out this characteristic of Roman policy in the first chapter of his *Evidences*. In the ruins of the temple was found an inscription in large characters, covering a long space, and, allowing for two or three lacunæ, easily decipherable. Its surroundings included a fanciful border representing the twisted bodies of salmon, the fish of the Severn, and cocks, serpents, dogs, and representations of human limbs, in connexion, it would seem, with the divinity of the temple. It would be going too far to say that this inscription indicates in so many words the purpose of the building in which it was found, or the name of the deity to whom it was presumably erected. Yet the burden of it, taken in connexion with the three votive tablets already mentioned, may be said to settle the question. D.A. . . . FLAVIUS SENILIS (IT RUDS) PR. REL. EX STREPIBUS POSSUIT O. . . . ANTE VICTORINO INTER. . . . ATE. The first two letters are possibly the pronomina of Flavius Senilis, who may well have been the owner of the villa, even as he in this inscription claims to have been the founder of the temple. It has been surmised that the abbreviated words PR. REL. stand for "præses religionis," an ecclesiastical title for which authority is not forthcoming; but they may also stand for "pretis relato," which, taken in connexion with the words next following—A.E. XX STREPIBUS, or stipibus—would signify that the cost of the altar or shrine was liquidated by the small pieces of money paid freely or

at the instance of the priests by the votaries. Such faulty spellings as "strepibus" for "stipibus," "possuit" for "posuit," &c., may be illustrated from the other inscriptions as well as from the whole range of later Roman epigraphy; and the learned Dr. McCaul, of University College, Toronto, has illustrated the practice of defraying the cost of putting up altars, statues, shrines, and the like from "penny contributions" by an extant inscription in Switzerland to Mercurius Augustus. It is in truth to Dr. McCaul's *Britanno-Roman Inscriptions*, published in Toronto and London in 1863, that we owe some of the most scholarly attempts at the solution of the inscription we are discussing. From what has been already made out, and the filling up of the lacuna between O and ANTE with two letters PUS CUR (opus curante), a text will have been reconstructed after a fashion which will be thus translatable:—"Flavius Senilis set up this temple at a cost defrayed by small money-offerings, Victorinus being the builder or clerk of the works." It should be noted that Victorinus is known to have been a name common among the Silures, and it will be observed that as yet we have not attempted to explain the defective INTER. . . . ATE. The only plausible solution of it is Dr. McCaul's suggestion that we should supply AMN=Interamnate, and understand the word as an adjective denoting the place of birth: so that Victorinus will thus be further identified as a local builder, Victorinus the Interamnian, or a native of the country between two rivers—"the eye between Severn and Wye," of which the proverb holds. This appendage of the birthplace is quite classical; and indeed in Cicero, *pro Milone*, we find mention of one Cusinius, cognomento Scela, Interamnus; who was a native, of course, of Interamna in the mother-country. Against this ingenious restoration and conjecture militates the fact that the fragment of the first missing letter which is still visible is unlike the top of the other A's in the temple inscription; but exact uniformity in the shape of the written characters is perhaps not more to be looked for than strictness of orthography. What makes the suggestion of Interamnate more helpful and ingenious is that it will serve to unriddle the puzzle of another "Inter" in one of the votive inscriptions, which we need not print in full, but of which it may suffice to say that its legend purports that "one Silvianus wagered a ring; one-half (the value of it) he presented (or vowed) to the God Nodens, and (as a certain Senecianus won the bet, and left Silvianus to pay his vow to the God how he could) besought the deity not to grant the blessing of health to any one bearing the name of Senecianus, until the said ring was lodged by its winner in the god's temple." After the words "donavit Nodenti" in the inscription, follows "Inter" with no accusative after it, but a relative clause beginning "Quibus nomen Seneciani." One explanation is to suppose an ellipse of "eos"; another to take "Inter" as a fragment of "In termino," referring to a terminal statue of Nodens. But the former is harsh, and the latter more than doubtful, as the terminal nude statue hard by has nothing to identify it with the British Æsculapius, as Nodens is accounted to have been, but has much more the appearance of a Pan, or Silenus, or of a terminal bust of Socrates, as figured in King's Horæ. But if we might take the fragmentary "Inter" for "Interamnati," on the faith of the plausible complement of Inter=ate in the other inscription, we have the God's locale, as well as that of Victorinus, satisfactorily identified. In such matters conjecture of course demands a very liberal margin; but it strikes us that Dr. McCaul's conjecture is in the very spirit of cautious scholarship, and shows, like other of his epigraphical studies, a remarkable acuteness in conjectural criticism. This votive inscription is on lead or pewter. Two others of briefer tenor are on stone; and one of them records that Flavius Blandinus, a light-infantry man (*armatura for armatus*), readily, as was meet, paid his vow to the great God Nodens; while the second declares that Pertillus, as was meet, paid to the God Nudens his promised vow. In this latter occur two orthographical irregularities, "promissit" and "Nudente" for Nudenti.

Whether the God's name was Nodens, Nudens, or Nodons, and whether such name is, as Sir Samuel Meyrick thought, traceable to the British "nodd," to preserve, or to Nodutus (or, as Varro calls him, Nodinus), said by Amobius and Augustin to be a rural God presiding over the "noli culmorum," is not of so much interest as the strongly corroborated fact that there was at Lydney a temple to a God of healing, held in repute and esteem by the military colony settled there, which seems to have testified this esteem by typical offerings in acknowledgment of his sanatory powers. As the application of the Greek epithet *ἰατρεὺς* to Æsculapius is problematical, we may be excused for citing another conjecture of Dr. McCaul's, which favours the identification of Nodons with Nodutus. "The circumstance that limbs were here offered" suggests to him the possibility of this God's connexion with the cure of diseases affecting the joints or "nodi," and the query whether the same deity may not have presided over "vegetable and animal nodi." However it be, here are three tablets—one in lead, as we know from Tacitus (*Ann. II.*, 69), was usual in recording execrations—witnessing to the name, and more or less to the functions, of a deity the remains of whose temple with the name of its founder and builder lie within the precincts of the greater camp. And this is the more interesting as, while Gross in his *Antiquities* avers that there are no traces of Roman occupation on either bank of the Severn beyond Gloucester, Hartshorne has made no mention of Lydney in his survey of the camps of the Romans in this neighbourhood. That there was an important Roman station there, and that, when Rome had established herself in Britain, it became the site of a palatial residence for some officer of distinction, is borne

upon the face of the ground itself, with its entrenchments, foundation walls, and numerous tessellated pavements. The museum in the mansion corroborates this conclusion by numerous coins of Galba, Hadrian, Antoninus, and other emperors, by curious and diverse fragments of pottery and tesserae, as well as rings, gems, hair-pins, fibulae, and many more accessories of civilized Roman life. On two pieces of pottery are female faces with the hair so elaborately dressed that they might provoke the jealousy of modern "artistes," and the female terminal statue at one extremity of the greater camp gives evidence of no small skill in the use of the brush and the curling-irons.

To turn, in conclusion, to the later traditions of Lydney Park, with a parting reference to its magnificent timber, it must be noted that the Manor of Lydney was granted to a gallant sailor, Sir William Winter, by Queen Elizabeth in recognition of his services against the Spanish Armada. Oddly enough, old Fuller, as well as Evelyn in his *Sylva*, refers to the tradition that one object of that futile scheme of invasion was to destroy and efface the noble woods of Dean Forest. If so, nothing could be more fitting than the grant to this naval hero of an outlying portion of that forest, which still, after the lapse of three hundred years, can boast of oaks and chestnuts of such grand dimensions as to be the glory of the district, and to deserve the envy of the foreigner.

JAY v. THE GRESHAM ASSURANCE SOCIETY.

THERE appears to be a difficulty in defining "temperance." A special jury of the county of York have been engaged for several days in trying the question whether a deceased lady of the name of Jay was of sober and temperate habits, and they seem to have adopted the distinction between *ebrius* and *ebrius* which is explained in a well-known novel. So far as can be judged from a condensed report of evidence, Dr. Jay, the plaintiff in this case, has succeeded under considerable difficulties. He was husband of the deceased lady, and he brought an action against the Gresham Assurance Society upon a policy of insurance of her life which was effected in 1872, about a year after his marriage with her. His own counsel stated that shortly after he was engaged to Mrs. Jay he noticed in her "some symptoms of excitement, which he ascribed to the effects of liquor, and under that impression he wrote to break off the engagement." Afterwards, however, he discovered that he was mistaken, and recalled his letter. Another fact was mentioned by the plaintiff's counsel in his opening. Mrs. Jay fell into a ditch between Scalby and Scarborough, but the ditch was covered with grass, and had deceived other people in the same way, and counsel undertook to prove that when Mrs. Jay fell into the ditch she was perfectly sober. This is what lawyers call a plea in confession and avoidance, and unfortunately the admission that Mrs. Jay fell into the ditch is clear, while the evidence that she was sober at the time could hardly go beyond this, that the witness saw no reason to suppose that she was tipsy. An obstacle still more serious to the plaintiff's success existed in a letter of the plaintiff, containing the words, "I never knew till she was married, and the life insured, that Mrs. Jay's failing was of old standing." The plaintiff's explanation of the word "failing" is that it meant "excitability." It is quite possible, however, that the plaintiff may have persuaded himself, when he signed the proposal for the policy, that it correctly described Mrs. Jay's habits and condition, though he may have learned to take a different view afterwards. But the question for trial was whether the description was substantially correct when the proposal was made, and, as the jury have found a verdict for the plaintiff, we must take it that they thought that this "excitability" which the plaintiff ascribed to his wife was compatible with sober and temperate habits.

A former clergyman of Scalby stated that he had known Mrs. Jay, and had never seen anything about her to denote intemperance. About twenty-four other witnesses were called to speak to the same point. They all agreed in describing her as an "excitable" woman, but declared that they never saw any signs of intemperance about her. On cross-examination, however, two of these witnesses admitted having seen Mrs. Jay apparently under the influence of liquor. The defendants, on the other hand, produced medical evidence to prove that, during a period of several years, Mrs. Jay had been advised and treated as a person of intemperate habits. Thus a witness who had attended her in the years 1864-6 "remonstrated with her on the subject of drinking, and advised her to give up brandy altogether." Another witness attended her for the last time in 1871. "He warned her that she was ruining her health and constitution by indulgence." There was also evidence of witnesses connected by marriage with Mrs. Jay, who, it was suggested, were unfriendly to the plaintiff. Her brother-in-law "had seen her absolutely drunk three times." He had told Dr. Jay before his marriage that Mrs. Jay (then Mrs. Lupton) took an excessive quantity of stimulants, and warned him against marrying her. But this witness also stated that, when she came on a visit to him in the autumn of 1872, she was better. "After that visit she went to Malton to be examined by Dr. Hickson on behalf of the Assurance Society." It is beyond doubt that Dr. Hickson passed her, and he stated in the witness-box that when he passed her she showed no signs of intemperate habits. She was married in September 1871, the proposal for insuring her life was dated August 19, 1872, and she was examined probably within a month afterwards. Thus, when Dr. Hickson saw her, she had been under

the care, both marital and medical, of Dr. Jay for nearly a year, and it is highly probable that both her habits and her health had improved considerably during that period. Dr. Jay first became acquainted with her in July 1871, only about two months before his marriage with her, so that substantially the whole of his knowledge of her habits was obtained when those habits were likely to be under his influence. She had been left a widow in 1870, and, supposing the tendency towards stimulants to have existed before that time, it was likely to increase during widowhood, and might possibly decrease again after her marriage with the plaintiff in 1871. This view of the case may explain not only the plaintiff's statement, but also the fact that the jury, after five hours' deliberation, substantially adopted it, as they must have done to find a verdict in his favour. They may have thought that Mrs. Jay was capable of being described, without violent untruth, in August 1872, as a person of sober and temperate habits. If they did not think this they ought to have found their verdict for the defendants.

The jury might possibly think the law, as explained to them by the Judge, severe, and might incline to mitigate it in practice. Mr. Baron Amphlett seems to have told them that the proposal which was the basis of the policy amounted in law to a warranty, so that, if the questions put by the Assurance Office were answered untruly, although the untruth was not known to the insurers, the policy would be vitiated. "This," he said, "was a harsh construction. But, as the law stood, he was bound to lay down that rule." The use of the word "warranty" in connexion with this subject has been objected to, as tending to introduce confusion, by a learned Judge, who said in a well-known case, "The breach of a warranty does not avoid the contract, unless the warranty amounts to a condition." Mr. Baron Amphlett doubtless meant to use the word "warranty" in this sense, as a warranty in the nature of a condition. The proposal was the basis of the policy, or, in other words, the policy was only granted on condition that the statements in the proposal were true in point of fact, and not merely true as far as the plaintiff's knowledge went. Policies are now usually framed so as to avoid any possibility of such questions as formerly arose, whether, in the absence of fraud, a statement untrue in fact would avoid the policy. As no point was made upon the construction of the policy in the present case, we may assume that the Judge's reading of it was correct, although he said that this was a "harsh construction." It follows that the jury might have found against the plaintiff without convicting him of fraud; but it was assumed by the plaintiff's counsel that if Mrs. Jay's habits were such as the witnesses for the defendants had stated, Dr. Jay must have known of them, "and therefore it was impossible to separate the question of fraud from that of warranty." It seems to us, however, equally impossible to disbelieve some parts of the defendants' case, and therefore we can only infer either that the jury thought those parts of the case compatible with sober and temperate habits in the deceased, or that the jury did distinguish between fraud and warranty, and, thinking that the plaintiff had been honestly incorrect in his answers, determined to do what they thought justice in spite of law. The appearances at the *post mortem* examination are very difficult to get over. Even Dr. Hickson, who had examined Mrs. Jay for insurance, admitted that "friability" of the liver, such as was found in her after death, might be "an early sign of fatty degeneration of the liver," and that was sometimes due to intemperance. Three medical witnesses called by the defendants declared their opinion that the appearances found on the examination had been caused by the abuse of stimulants. Taking these opinions in conjunction with the evidence of other medical men who had attended Mrs. Jay in the years previous to 1871, a strong *prima facie* case is made out against the probability that Mrs. Jay's habits could have been strictly sober and temperate in 1872. Even her brother-in-law, who stated that, when she came on a visit to him in the autumn of 1872, she was better, added, "he checked her from drinking brandy."

It is unsatisfactory to attempt to form an opinion on such a case from necessarily brief reports of evidence. There will perhaps be a motion for a new trial next term, and, if so, the discussion may be expected to range over the whole of the shorthand-writer's notes; but on a hearing *in banco* it will not be necessary for the plaintiff to denounce the defendants as listening to and collecting scandal, nor for the defendants to answer that the protection of their shareholders is the only object of their proceedings. It is a serious matter for an Assurance Company to attempt to resist a claim and to fail in so doing. As was said by the plaintiff's counsel, the case is important to all persons who effect insurances on their lives, and who wish to know whether they are bequeathing to their families a law-suit or a provision for their subsistence. We shall look therefore with interest next November to see whether any further proceedings are taken in the case.

MACAULAY IN OFFICE.

IN his essay on the Life and Writings of Addison, Macaulay refers to an idle tradition that the author of the best papers in the *Spectator*, when in office, was sorely puzzled about the preparation of a letter to the King, and had to call in a clerk, who at once did what was wanted. And then the modern essayist proceeds to demolish a story "flattering to mediocrity," and to "deprive dunces of their consolation" by showing that Addison probably wanted some information on a mere point of official

form, which the ablest statesman cannot know by intuition, and which it is the duty of permanent Under-secretaries and of head clerks to have at their fingers' ends. The origin of the anecdote is doubtless to be traced to that dislike of literary ability which pervades the official intellect, brought up entirely on Resolutions, "Proceedings," and red tape. It flavours some of Mr. Trollope's characters—Butterwell, Sir Raffle Buffle, and even Adolphus Crosbie. There is a feeling in some quarters that a man who can write a slashing leader cannot be trusted to pen an official "wig"; and while some critics marvel how Mr. Tom Taylor can ever have shown himself efficient as Secretary to the Board of Health, others are never so delighted as when they can detect a grammatical error in the *Juventus Mundi*, or an inappropriate epithet in *Coningsby* or *Lothair*. The truth is that, though there are certain characteristics which mark a good official style, there is no reason whatever why men distinguished at the bar, in the senate, or in literature, should not confute a diplomatist or instruct a subordinate in language simple, perspicuous, and yet strong. The official style of both Croker and Canning is said to have been a model of that species of composition. We have been led to make these remarks by the perusal of a small volume which contains the minutes of Lord Macaulay on Education in India, written in the years 1835, 1836, and 1837. After the renewal of the Charter of the East India Company in 1833, Macaulay filled the new office of fourth or Legal Member of Council, during a part of the administrations of Lord William Bentinck and Lord Auckland. At the same time he discharged gratuitously the duties of President of the Committee or Council of Public Instruction. This office was by no means a mere sinecure, nor was it one in which the occupant, like a Lord Rector, could clear his conscience by the annual delivery of an elaborate historical essay. The Council had its secretary, who drafted the correspondence, kept the books, and prepared the agenda; but the members had the superintendence of all the existing colleges and schools in the Bengal Presidency, and this involved the solution of all local and petty squabbles, as well as the determination of those broad and important principles which are sure to be hotly discussed as soon as the State sets itself in earnest to educate any portion of the community. Many men very familiar with the career and character of Macaulay might be inclined to surmise that, as President of this Council, he must have occupied himself solely with great subjects, and that he left details either to his secretary or to the colleagues whose training and experience had made them familiar with Oriental literature and Anglo-Indian life. Nothing of the kind happened. Macaulay certainly was called on to put forth his whole strength in the celebrated controversy of the Anglicists and Orientalists; and the minute which he penned in favour of the English language is, in finish, argument, and point, almost equal to his contributions to the *Edinburgh Review*. But he really seems to have thrown himself into the ordinary work of control and direction with single-heartedness and zeal. At that epoch there were no Inspectors of schools. The whole business was done by Local Committees. Everything was referred to the governing body at Calcutta, and Macaulay had to decide what amount of rent should be sanctioned for a school-house, what sort of books should be purchased as prizes, and what travelling allowance should be recommended for a master who was transferred from one school in Behar to another in the North-Western Provinces.

Now we were quite prepared to find in Macaulay's notes and minutes some very clever writing, some ingenious paradoxes, and some occasional dogmas. But we were hardly prepared for the amount of conciliation which he evinces in dealing with irritable colleagues and subordinates, and for the strong, sterling, practical common sense with which he sweeps away rubbish or cuts the knots of local and departmental problems. Some of his decisions are still influencing the course of education in India to this hour; and others, on transient or ephemeral topics, have a pleasant flavour of originality or humour about them. Though the educational system was not very old, abuses had already crept in. A gentleman named Adam, well known for his compilation of statistics of indigenous vernacular schools, lamented the discontinuance of "hereditary professorships." Macaulay reminds his colleagues that there is something "extravagantly absurd" in such appointments, and says:—"Here are six endowments of the same sort. Two are continued, and Mr. Adam acknowledges that they are mere jobs. But if the other four were revived, 'an immense impulse would be given to learning.' I am forced to say that I do not see how Mr. Adam has arrived at this conclusion." The Local Committee of Furruckabad, having spent 12,000 rupees very heedlessly, ask for 8,000 rupees more. They are told that a "large grant of money has been spent in enabling a cunning old Mussalman to acquire a high character for piety and munificence amongst his brethren at the cost of the State. The only use to which, as far as I can see, this institution [a Madrassa or Mahomedan school] can now be put is that it may serve as a warning to us in our future dealings with these liberal founders and endowers of colleges." A martinet colonel urges the necessity of putting military men on the Committee as a check on the civilians. He is informed that the "Council have never, to the best of my belief, been troubled by such idle jealousies. I would appoint the fittest men, without caring to what branch of the service they belonged, or whether they belonged to the service at all." The practice of giving false encouragement to learning called forth some apt remarks. Almost as many prizes were given in one school as there were students; and in another the boys received stipends to tempt them to learn. The President says

truly that the most trifling honorary distinction—a copper medal, or a book worth two rupees—if given only to one highly distinguished student, would do more to excite industry than a thousand rupees laid out in presents to the majority. And he "cannot consent to pay anybody to study until we have the means of furnishing instruction to all who are desirous to study without being paid." At that very time it had been actually proposed that, certain stipends having been abolished, compensation should be given to those students who in process of time, and in the run of promotion, might have enjoyed the same. Macaulay demolished this contention by showing that a vested interest was one thing and a contingent interest another; and he followed it up by remarking that, though when the posts of Teller and Auditor of the Exchequer and of Chief Justice in Eyre were abolished in 1817, as were half-a-score Irish bishoprics in 1833, the rights of incumbents were respected, yet Parliament stopped there, and never considered the case of an Irish curate who might have been a bishop, or of a young politician who had a fair chance of becoming Chief Justice. "Let those who have anything keep it, is a plain rule. But let those who hope for anything get it, is quite a different rule." In the same strain he objected to pension the families of schoolmasters, or a corrector of the Arabic press whose situation had been abolished as utterly useless, and he annihilated a ridiculous proposal to start an infant school, resembling those of England, for the children of coolies and tailors. This absurdity was the more startling because it was backed by men who pretended to have some knowledge of "the habits and feelings of the natives."

The passage in which Macaulay discusses the relations of parents to children, and the duty of individuals and of Government to step in occasionally and supply what is wanting, is too long for quotation. But its general sense is admirable, and it ends with a sentence which, like that of a Bishop not long ago about England free and England sober, may startle and alarm, though it is not the less true:—"I would rather hear a boy of three years old lisp all the bad words in the language than that he should have no feelings of family affection; that his character should be that which must be expected in one who has had the misfortune of having a schoolmaster instead of a mother." In the comparative infancy of education the Council was occasionally sorely troubled to find any masters competent to teach sharp young Hindus. They got the leavings of other professions—missionaries tired of converting or of not converting the natives, a sub-editor who had quarrelled with his chief, a clerk who had lost his place, and a shopkeeper who had failed. But the President would not reject a candidate who could not spell the word "proselytize" correctly, nor another who mistook Argos for Corinth, and sent Crassus to Spain instead of to Corinth. He was for any candidate of respectable character who could "read, write, and work a sum." This tenderness is remarkable in a writer who was perpetually twitting English gentlemen with their deficiency in the knowledge attained by fourth-form boys and girls at a boarding-school. On the subject of proper books for school prizes, and even for school courses, something may be learnt even now from such a discussion on India. *Robinson Crusoe* was worth all the grammars of rhetoric and logic in the world. *Jack the Giant Killer* and *Gulliver's Travels* were far superior to books filled with idle definitions and distinctions which "every man who has learned them makes haste to forget." "Who ever reasoned the better," asks the President, "for having been taught the difference between a syllogism and an enthymeme?" "or who composed with greater spirit and elegance because he could define an oxymoron or an aposiopesis?" On another occasion he objected to pay 300l. for an Asiatic version of Bridge's *Algebra*, "a translation which nobody will read, of an original which nobody was ever the wiser for reading." Then a certain gentleman was going to leave the station of Hooghly, and, as constantly happens in Indian society, wanted to dispose of his library. The Local Committee was willing to take it in a lump, and would have rewarded Nabin Ghose and Mohan Bose, successful prizemen, with Abercrombie on the "Intellectual Powers," Dick's "Moral Improvements," Young's "Intellectual Philosophy," and Chalmers's "Poetical Economy," whatever this last work may be. To this list were added such attractive compilations as Niggen's "Earth," Mudie's "Sea," and somebody else's "Fire and Air." Macaulay, premising that there ought to be a marked distinction between a school-book and a prize-book, and that he had not forgotten his delight at getting Boswell's *Life of Johnson* when he was fourteen, gave his colleagues off hand a list of prize-books, including amongst many others *Gil Blas*, the *Arabian Nights*, and Southey's "Nelson," some of which maintain their ground in India to this day.

In short, though we are occasionally reminded that Macaulay in office was still the biting essayist and the irrepressible scholar, his perception of scholastic absurdities, and his refutation of official crotchets, appear to have supplied to his colleagues exactly what they required. One member wished to imprint armorial bearings of some kind on an array of well-bound prize-books. Macaulay reminds him that heraldry is not a science, but a system of arbitrary canons, which in the eyes of Englishmen are only saved by associations and memories from absurdity and grotesqueness. But to Hindus, and more especially to Mahomedans, "a lion rampant with a folio on his paw, with a man standing on each side of him with a telescope over his head, and with a Persian motto under his feet, must seem very mysterious or very absurd." He was in the main right; but the natives of India have long learned to tolerate in their rulers many social customs which must to them appear more unattractive or offensive than embla-

soned books. With equal point and earnestness did the pen of Macaulay protest against encouraging a taste for architectural elegance in schools for which the essentials had not been provided; against widening the breach between Hindus and Mahomedans by educating them separately, or by allowing either class to monopolize a liberal education; against giving too many holidays; and against teaching English without at the same time giving lads the opportunity of learning their own vernacular tongue. And in one of his earliest minutes he sketches out a plan which, though recommended by several Indian officials of great practical experience, is in Bengal Proper only just now introduced in its fulness, and was only tried at all by the present Governor of Jamaica ten years ago, a quarter of a century after Macaulay's time. This was simply to build up a system of vernacular education for the masses by improving the existing village schools. Macaulay would have given grants in aid, of small amount, to the dominies who preside over these rural seminaries, on the principle that it is preferable to elevate them, where they exist in thousands, than to endeavour to supplant them by scores or hundreds of our own invention. The germ of another very serious difficulty was clearly foreseen and predicted. The object of educating the intelligent portion of the native community is that they may be conductors of knowledge to the people. But it is obviously useless to fill them with knowledge at one end and then to separate them from the masses at the other. Yet something of this kind has happened, and it is what Macaulay foresaw. A native who has graduated in Arts or Law in any Indian University is to a certain extent estranged from his countrymen. His one object is to gain a situation under Government, or to obtain success at the Bar. The time may come when it will pay a native to take honours in surveying, to create a literature for thousands of readers, or to find some other way to independence than the judicial or executive lines. But this time has not arrived. And though the public service is more efficiently recruited than it used to be by the plethora of educated collegians, yet we submit that the highest aim of all State education is not that holders of prizes should become holders of places and pensions.

One more extract and we have done. At one of the colleges of Calcutta the yearly distribution of prizes was followed by an exhibition of spouting for the edification of the English and the native community. The selection was unfortunate, and the actors and the play were so effectively disposed of by Macaulay's rhetoric that, to the best of our knowledge, the thing has never again been tried:—

I can conceive nothing more grotesque than the scenes from the *Merchant of Venice*, with Portia represented by a little black boy. Then, too, I think the subjects of recitation ill chosen. The society of Calcutta assemble to see what progress we are making, and we produce, as a sample, a boy who repeats some blackguard doggerel of George Colman's about a fat gentleman who was put to bed over an oven, and about a man-midwife who was called out of his bed by a drunken man at night. Our disciple tries to hiccup, and staggers about in imitation of the tipsy English sailors whom he has seen at the punch-houses. Really, if we can find nothing better worth reciting than this trash, we had better give up English instruction altogether.

It may be doubted whether scenes from *L'Avocat Patelin* or *Le Bourgeois Gentilhomme* are altogether suited to annual displays at our public schools. But there can be no question that Macaulay conferred a lasting benefit on Young Bengal by refusing to permit Hindus to graduate publicly in buffoonery and vulgar oaths. We have no space left to give any summary of the grand controversy between the Anglicists and the Orientalists, in which Macaulay triumphed and the Pundits were defeated. *Cicerone laudatore opus est*. The historian should have described the battle himself; prejudice, ponderous but useless erudition on one side; light, sweetness, and a liberal education on the other.

The little volume from which these extracts have been taken exhibits Macaulay in a new and pleasing light. The work begun by him and his colleagues is bearing fruit to this day, and the cardinal principles of his policy have never been assailed with success or abandoned without detriment. The connexion of Macaulay with the East is now half forgotten; in another generation his residence at Calcutta may become as recondite a question of scholarship as the two or three visits of *Æschylus* to Sicily; and some diligent student of the twentieth century may possibly have to take some pains to prove to a sceptical or ill-informed public that the founder of the Indian Penal Code and the friend and colleague of Lord William Bentinck was one and the same person as the author of the *History* and of the *Lays of Ancient Rome*.

THROWING A LIGHT ON IT.

A CONFERENCE of Spiritualists was lately held in London, and arrived at the conclusion that the great need of the age is a recognition of the truth of Spiritualism and a practical acceptance of its teachings. Within a week after this Conference some proceedings took place at Gateshead which do not render it probable that this great need of the age will be speedily attained. It appears that Mr. Auckland, grocer, of Gateshead, paid a shilling and got a ticket of admission to a room in Freemason's Hall in that town. His assistant, named Rook, paid a shilling, and was admitted at the same time. They sat down. One of the party assembled in the room said that any gentleman present might fasten the hands of the mediums. Mr. Auckland saw two women opposite to him. These were the mediums. They appeared to be

fastened. He was requested to sit in a particular place. His hands were held by two persons. Before the gas was turned down, it was stated that those of the company who were sitting opposite to the mediums might put their feet on the mediums' feet, to feel whether or not they attempted to withdraw. Mr. Auckland hereupon put his feet on the feet of one of the mediums. He saw some one attempt to fasten the medium to the chair. The gas was now turned down, and some one began singing a "spiritual" hymn very lustily. The medium who was opposite to him sang very heartily. He did not sing. The song was "Shall we gather at the river." Mr. Auckland still had one of his feet on those of the medium. After that, some one sang "a Newcastle song," which is described as "quite different from the sentimental song" about gathering at the river. After other songs, Mr. Auckland put his hand into his pocket and took hold of a lantern which he had brought with him. There was a noise, and he turned the lantern to that part of the room whence the noise proceeded. The noise was like as if some one was beating something about the floor. It was said that that was the spirit "Geordie." On turning his lantern on the spot, he found that the medium furthest from him was in the act of sitting down in the chair, and the straps he saw hanging loose. "He had not the slightest doubt about that being the fact." He found no one on the floor. He saw no man in any place except the circle. He saw nothing to account for the noise that he heard except the medium at liberty. After a few minutes, the gas was turned up, and one of the mediums was taken out of the room. She was said to be in hysterics. Mr. Auckland now attempted to leave the room, but was pushed or held back by two leaders of the meeting, Mr. Blake and Mr. Pickup, against whom a charge of assault was preferred by Mr. Auckland. The real object of this proceeding appears to have been to give Mr. Auckland an opportunity of stating on oath before magistrates what he saw when he turned the light of his lantern upon the Spiritualists. He admitted that he knew that it was to be a dark *séance*, and that strangers were only admitted on condition that they linked their hands, and did not unfasten them during the performance. He did not remember being told, when he first went in, not to expect any manifestations.

The assistant, Rook, was also examined, and said that he went with his master to the *séance*. He sat down, and his hands were held. He saw a light flash from his master's lantern, and he then saw a man, a member of the Society, with a ginger beard, who was one of the circle when the gas was turned down, lying on the floor with a broken fiddle in his hand. He also saw one of the mediums in the act of sitting down, and one of the members leaning on the arm of the chair. A witness for the defendants said that he told Mr. Auckland that he would have to stop until it was seen whether he had done any damage. "The fiddle was broken, and the medium was in hysterics." He was certain that she was in hysterics. He described himself as an "investigator," and he admitted that he held Mr. Auckland's hand, and would not allow him to put out his foot. He said that when the lantern was turned on, the mediums were sitting in their chairs. Another witness, who was not a member of the Society, heard some one ask the persons present to take hold of each other's hands, and not to unfasten them until the gas was turned on, "or the consequences might be very serious." It was explained that a musical box, or something of that kind, might be floating about the room, and if the light was turned on it might come down, and do some one a serious injury. There were some rappings, and things of that sort, and then Mr. Auckland flashed a light across the room. He heard convulsive sounds proceeding from one of the mediums. He recognized her face, and would swear she was on the chair, and had the straps round her wrists. He believed the girl was in hysterics.

The discussion between advocates on the question of assault is, for our present purpose, immaterial. The magistrates ultimately decided that both parties were in the wrong, and that each party should pay their own costs. The man with the ginger beard, whom the witness Rook said he saw lying on the floor with a broken fiddle in his hand, was not called as a witness, nor does any attempt appear to have been made to compel Mr. Auckland to pay for damage to the broken fiddle or to the girl who had hysterics. No musical box descended on anybody's head. If Mr. Auckland and his assistant are to be believed, their testimony ought to be conclusive. Mr. Auckland swore that when he turned the light on, the medium furthest from him was in the act of sitting down, and the straps were hanging loose. But a witness on the other side swore that one of the mediums was on the chair with the straps round her wrists. This, however, may have been the medium nearest to Mr. Auckland, and she might have good reasons for not moving. Another witness swore that the mediums were sitting in their chairs. If he spoke as to a moment later than that spoken to by Mr. Auckland, the two statements might be consistent. The assistant, Rook, swore that he saw one of the mediums in the act of sitting down. He also swore that the man with the ginger beard was on the floor, but Mr. Auckland saw no one on the floor. However, they both agree that one of the mediums was in the act of sitting down, and this is as strong evidence as is likely to be ever attained in such a case. But probably it will convince only those who did not need to be convinced. At the Conference of Spiritualists, a member remarked that a piece of cloth cut off by a female spirit from her "materialized" skirt was found to have been dressed with lime in the Manchester fashion, "and he admitted that this presented a

difficulty to Spiritualists which had not yet been accounted for." The candour of this admission surprises us, for we should have thought that a person capable of believing in a "materialized" spirit at all would have been easily able to believe that the spirits could dress in any fashion whatever. Another member mentioned an instance in which spirits had manufactured pills which were afterwards taken with marked effect by a lady of his acquaintance. If it appeared on examination that these pills were made of ordinary doctor's stuff we should not expect that Spiritualists would be at all shaken in their belief. Indeed the spirits of the middle ages were abundantly materialized. We all remember the story of St. Dunstan's servant who, in his master's absence, used his charm, and ordered the spirit which answered the call to be perpetually bringing more beer. The spirit obeyed this order so energetically that the servant was almost drowned in beer when his master rescued him. Hitherto the modern spirits have supplied little except remarkably poor verses. If there be any desire to hold a really experimental *séance*, we would suggest that the floor of the room might be covered with fine sand, as was done when Daniel solved the mystery of the nightly consumption of provisions in the Temple of Bel. Neither a medium nor a member with ginger beard would be able to assist the spirits in their performances without leaving marks upon the floor. But perhaps, if marks were clearly seen, it would be alleged that a "materialized" spirit made them. The priests of Bel, upon the discovery of their imposture, were put to death, and it would be useful if, upon clear proof of fraudulent practice by Spiritualists, they could be punished summarily as rogues and vagabonds. The Duke of Gloucester, in *King Henry VI.*, miraculously cures a cripple at St. Alban's by sending for the town beadle with his whip. Those who pretend that a musical box can float in air, but only while hands are joined and light excluded, deserve to be encountered with the same convincing argument.

One Dr. Davies read a paper at the Conference, in which he defined his position with regard to Spiritualism as that of an inquirer, adding that, even if he became convinced of its truth, he saw no reason why he should alter the opinions he at present held as a clergyman of the Church of England. It appears to us that a good deal depends upon what may be the opinions which Dr. Davies at present holds. We should think that Spiritualism is inconsistent with any rational form of Christianity. Indeed a speaker at the Conference thought "that the expression of sympathy with the New Testament ought to be expunged from the Association's principles," and we incline to agree with him. He believed that the introduction of the theological element militated against the spread of Spiritualism, especially in the Midland counties, "where the people are rather Radical in their tendencies." Some revelations, however, are quite orthodox, while others supply improvements upon the Bible. Thus we find that a spirit calling himself the Egyptian has appeared several times at Brighton. This is, or was, a wicked spirit, but Mrs. Woodforde, "a lady in every sense of the term," seems now to have him under control as fully as Michael Scott had "the fiend in the shape of a huge black horse" on which he rode through the air from Scotland to Paris. A gentleman of the name of Snow testifies to the beneficial effect on his health of a course of mesmerizing which, through Mrs. Woodforde, he has undergone from her guides, including, as we understand, the once wicked, but now penitent, Egyptian. Mr. Snow feels sure that "all persons whose constitutions require a refined and delicate influence could not do better than apply to the same source." We only hope that Brighton is duly sensible of the privileges it enjoys. It keeps the devilish in the Aquarium, and the Devil himself may be spoken with by persons requiring a refined and delicate influence for their constitutions, if they think proper to apply to Mrs. Woodforde. It almost makes one melancholy to hear that the Devil has thus taken to a pious course. He was in life an Egyptian prince or chief who oppressed and tortured the children of Israel, and since his death for three thousand years he has tempted men and women to murder, rapine, and every evil deed; but now he is sensible of a strange softened feeling, he sees the wickedness and vileness of his past existence, he asks for our pity and our prayers, he is willing to make himself generally useful at Mrs. Woodforde's *séances*, and, in short, he may be safely recommended as a very nice man for a small tea-party. We cannot help saying that this is a sad come-down in the world for him, and we can only hope that he may be spared the additional humiliation of having a lantern turned on during his revelations. Dr. Davies will no doubt be glad to hear that Mr. Snow considers that the Christian doctrine of mediation has been elucidated at Mrs. Woodforde's *séance* at Brighton. The *Spiritualist* may be expected to explain in an early number that the truth of its principles has been conclusively demonstrated at (Lutescent). We think, however, that if Mr. Blake and Mr. Pickup were so clearly in the right they need not have got into such a passion with Mr. Auckland. We do not find that the apostles of Christianity ever threatened to smash anybody's nose.

THE SPHINX TRANSLATED.

IT would be unfair to judge of a French play by an English version, and particularly unfair when that play happens to contain the character of a Frenchified Scotchman, which is absurd even in the original, and cannot help becoming extravagantly ludicrous in a translation. The heroine of the *Sphinx* is a married lady who, during her husband's absence on foreign service, contemplates,

or pretends to contemplate, elopement with a Scottish marquis. The refinements by which French dramatists endeavour to give an air of novelty to adultery perish in the attempt to transfer them to the English stage, and the loss is not greatly to be regretted. Lord Astley describes himself as a man who asks nothing, who expects little, and who gives everything; and he thinks, and so do we, that the lady may be at loss to understand the devotion which he offers to her. To ask a married woman to run away with you, and to say that you are asking nothing, is certainly putting a new gloss on an old-fashioned sin. Lord Astley has thought that Blanche de Chelles was suffering a premature weariness of life, and he has dreamed of providing for her in his Scottish castle a retreat from fatigue and disgust, where she may reign alone; for he promises, and his word is sure, that he will never trouble her with his presence without being summoned by her. The sole privilege that he would claim would be that of guarding her domain, and of protecting against all comers, even at the cost of his own life, the repose of hers. It is only necessary to translate Lord Astley's speeches somewhat closely into English in order to see what sad stuff they are. Why should Blanche exchange a lively château in France for a dreary castle in Scotland? Why should she go all that distance to attain a result that is perfectly practicable close at hand? The Admiral, her father-in-law, is both willing and able to lock her up, and to shoot any man that may try to speak to her. Of all inducements to adultery, the most unlikely would seem to be a promise by the lover that he will never come near his mistress unless she sends for him. But this lady is supposed to have nothing vulgar about her, even in her sin. Whether she finds the promised solitude of a Scotch castle attractive is not clearly explained, but she makes an appointment to elope with Lord Astley, which is interrupted. That estimable nobleman, when he next appears, is preparing to return to Scotland alone, and his sole anxiety is to bestow before departing some advice upon another lady, Berthe de Savigny, which we must take leave to call impertinent. We are told that he spends his vast income magnificently, and he is equally liberal with his opinions. The author had not, in this character of Lord Astley, the slightest idea of a satire upon Scotland, but, on the contrary, he seems to think that he has drawn a fine portrait of a Northern nobleman. The substance of Lord Astley's advice to Berthe is that she should keep an eye on Blanche, who is too fond of Henri de Savigny, Berthe's husband. After an intolerably long speech, he ends with the warning, "If ever Blanche should become a widow, look out for yourself." One can only pity the actor whose fate it is to deliver this ridiculous speech in English. One can feel sympathy with virtue, and interest in the bolder forms of vice, but this Scottish marquis is only fit to talk scandal at a tea-party of old ladies. He has conceived, he says, a profound esteem for Berthe, and he desires to prove it by advice of a highly delicate nature, which he hopes she will receive as if it were the last testament of one who is departing. He prophesies that the heart which is now estranged from her (meaning her husband's) will return, and he asks from her encouragement to perform the painful duty which he has assumed. Thus he comes near to his purpose of warning Berthe against Blanche, and we feel inclined to ask, What has he to do in such a business? He protests that he does not seek to avenge himself on Blanche for deceiving him by seducing her, but he looks a good deal like it. There may come, he says, a moment when not only the peace, the home, the credit of Berthe will be threatened, but something else, meaning probably her life. He knows how much there was, and still is, that is noble, generous, and charming at the bottom of that strange and troubled soul of Blanche; but there is much also that is terrible. Women like her are stars escaped from their orbits which know no laws. To-day they attain heroism, to-morrow crime. And he concludes with a solemn and mysterious warning, by which he appears to intimate that Blanche, capable at any moment of adultery, could for an adequate consideration come up to murder. The only parallel to this scene that we can find occurs in a drama produced by Mr. Crumple on the provincial stage, where somebody in a cloak said "Beware!"

When this play was first performed in French at the Princess's Theatre, with Mlle. Favart as the heroine, we described its plot and characters, and the death-scene to which it owed its popularity. Even under these favourable circumstances we were compelled to say that in parts it was not only disagreeable but dull. But it is not until the play is translated into English, and an attempt is made to perform it on the English stage, that we become fully sensible of its dreariness, and, in some scenes, of its absurdity. A Scotch lord would be to a French audience a merely fabulous monster who might utter any wild extravagance without exciting their surprise, and if we hear a French play even in London we accept things in it from the French point of view. But when a Scotchman talks nonsense in his native tongue, there is no illusion to prevent our discovering that it is nonsense and nothing else. It is a pity that the choleric old Admiral does not kick Lord Astley out of his house. It is all very well for Blanche to express her rapture for "ce pays sauvage," meaning Scotland, but to us it is a decent Christian country, inhabited by people who behave themselves rationally. The author pays Scotchmen the compliment of making Lord Astley speak French "sans accent," but by way of set-off he talks in a deplorably silly way. According to him, Blanche de Chelles is an "intéressant produit de notre haute civilisation," upon which he delivers a lecture suitable for a meeting of the British Association. He explains that she was born grown up, that for her the forbidden fruit had lost its flavour

almost before she had tasted it, and that she cares not for love unless it be seasoned by crime. The only limit that further discussion indicates to this lady's capacity for vice is that her father-in-law, the Admiral, will certainly shoot her if he finds her out. One could with difficulty imagine a more dreary subject for a play. To see it is like eating ashes in place of bread. When we remember that the *Sphinx* was produced at the Théâtre Français it is difficult to bring ourselves to believe that there is really nothing in it except a suicide at the end. The play opens after dinner at the château, and Blanche, who has a long trailing dress, and is altogether magnificently got up, announces that she is going to row upon the lake. The gentlemen who are rivals in her service might find employment in tucking her skirts into the boat. Ladies sometimes row, or pretend to row, on the Thames, but they do not usually go afloat in evening dress, nor do they require gentlemen to attend them with fans. However, Blanche returns, exclaiming that she has blistered her hands, and is thirsty. She orders one of her suite to fetch her some grapes, and he obeys, remarking that she has had her dinner and will make herself ill. It occurs to us that, if this be comedy, we have been talking comedy all our lives. Presently she explains that her ring has hurt her hand in rowing, and this leads to the further explanation that this ring bears a sphinx's head in which is concealed poison. We gather from her calling her horse "Black," and other symptoms, that the author supposed himself to be copying one side of her character from England, but it appears to us that he knows as much about English girls as he does about Scotch lords. This "interesting product of our high civilization" has written a number of letters to a gentleman, Henri de Savigny, which she has not sent to him. When that gentleman, who has a wife, Berthe, expostulates with Blanche on the frivolity of her life, she hands him the packet of letters in order to convince him that she is capable of serious feeling. Afterwards these letters come into the hands of this gentleman's wife, and she insists that Blanche shall quit the neighbourhood, threatening, if she does not, to show the letters to the Admiral, who will certainly punish her infidelity to his absent son by shooting her. This threat produces a quarrel between the two ladies over their afternoon tea, and Blanche, after some momentary inclination to poison her rival, concludes to poison herself with the contents of the ring, and dies.

There are at this moment seven theatres open in London for plays as distinguished from operas, and two of them are occupied with translations of French comedies on the interesting subject of adultery. The heroine of *Led Astray* has a husband to look after her and to do any necessary shooting, and the scene before he goes out for a duel with one of her admirers gives scope for impressive acting. But if we except the dying agonies of Blanche, which are unpleasant, there is nothing in the *Sphinx* to raise emotion of any kind. It is naughty, but it is not nice. If you take one of Congreve's plays, and strike out all the wit and the broad indecency, you might by reading it prepare yourself to endure with patience a performance in English of the *Sphinx*. It avails not to remark that Mlle. Beatrice presides over a well-drilled company, and that she performs the heroine with skill and without extravagance. It is a pity that so much labour should be bestowed on a barren field. We cannot believe that any translation or adaptation of this play will be successful on the English stage. The play of *Dalila*, by the same author, was only moderately successful, although it showed an extravagance that was almost poetical. It is a pity that Mlle. Beatrice should have incurred so much expense in producing the *Sphinx*, but fortunately the dresses and decorations will do equally well for another play of the same class. It begins to be a serious question what French dramatists are to do when all forms of actual and possible adultery have been exhibited on the stage. Among the products of high civilization, a vigorous and wholesome drama does not seem to be included.

REVIEWS.

FLINT'S PHILOSOPHY OF HISTORY.*

WHEN, on taking this volume in hand, we found that we had to do with a man who knew of Wegelin, we were at once prepared to find in Mr. Flint an instructor. And Mr. Flint not only knows of Wegelin, but knows more about him than the Germans themselves do. Even Rosenkranz, whose mention of him drew Mr. Flint's notice to him, was imperfectly acquainted with his writings. Wegelin was a Swiss pastor and librarian of St. Gallen. His friend Sulzer, who knew him to be too good to be wasted on a remote and obscure position, obtained his removal to Berlin, in the capacity of Professor of History in the new Ritterakademie. This occasioned his *Histoire universelle et diplomatique* to be written in French, and its language has probably contributed to bury his book in entire oblivion. His name is indeed preserved in our biographical dictionaries, but his book will hardly be found even in great public libraries. Schlosser, who knows Iselin, has no mention of the more considerable Wegelin.

We have only mentioned one little-known name as a specimen which may serve to show that Mr. Flint is no bookmaker, retailing information from secondhand sources, but has made at least some

search among original authorities. The subject he has selected is a new one, in this country at least. Philosophies of history we have had many, but we are not aware that any English writer has hitherto devoted a book to a history of these philosophies. The impalpable character of the subject thus selected is an obstacle in the way of its successful treatment. Professor Flint feels this difficulty, for he declines at the outset to give any definition, or to attempt a precise description, of what the philosophy of history is. Written history is itself at best slippery ground, and can only be considered a conjectural interpretation of the real course of things. The philosophy which is erected on this quaking soil can hardly be a very substantial foundation. This ideal erection becomes in its turn the subject of a history! A less tangible matter historian surely never undertook to deal with.

All histories of abstract ideas are liable to the same defect—namely, that they tend to become mere abstracts of the books professedly published on the subject. Professor Flint is no exception. After an attempt, in an introduction of sixty pages, to pursue and disengage his idea through the early, classical, and mediæval periods, he fairly lapses into the usual system of analysing books. We know that this is inevitable, and we acquiesce in it. It is not a greater falling off than Mr. Buckle's, who opened with a solemn denunciation of ordinary histories, asserted that the only historical facts which an historian of civilization could regard were statistics, and then, in the very same volume, degenerated into retailing precisely the same anecdotes, and the same imperfectly vouched facts, which all other historians had always been repeating from the beginning of historical writing downwards. Thus it has ever been with the attempt to write the history of an abstract idea. It ends sooner or later in a history of books. And a history of books is a very different thing from a history of the progress of an idea. Where we have to do with opinions, the important thing is not the bare utterance of an opinion, but its prevalence. It is nothing to the historian that some solitary thinker has committed an important truth to the obscure pages of some neglected writing. What the historian must desire to represent to us are the broad phasos of belief which have been influential on the course of human affairs from age to age. This is a very different matter from the contents of the books of the great philosophers. Professor Flint is doubtless quite aware of this. He says himself with great truth that philosophy advances not by a series of great steps, or by the succession of great systems, but by every labour that extends the limits and increases the wealth of human thought. Its progress does not depend upon the last great thinker, but upon utilizing for the purposes of political and social life all the acquisitions of the whole past. The mode of thinking in any age is the result of the total antecedent thinking of the age which has gone before. It is the sum of the acquisitions of all the subordinate sciences, each of which advances by countless small steps. These ideas alone deserve the name of philosophy which correspond to the requirements of the new epoch.

It is this prevalent belief about the course of human events which Professor Flint announces in the opening as his subject—the belief, namely, that the reign of law somehow extends over human affairs; that the fate of nations has not been abandoned to caprice and chance, but is embraced within a system of order; that amid all the apparent confusion and incoherence there has been some sort of growth, some sort of development of the mind and spirit of the human race. It is not merely a book-lore or a closet speculation of which he will be the historian, but a practical belief which has been operative since history began. While men are still disputing as to the reality of any philosophy of history, as to its existence at all as a separate science, the cares and trials of common life, the movements of population, the struggle for existence, all these have for countless generations been bringing the problem in manifold forms before the human mind, and in contact with the human heart. Some kind of philosophy of history must have been as old as history itself, and the first question man proposed to himself may well have been that which Milton puts into the mouth of Adam, "How came I thus, how here?"

To trace the transmission, metamorphoses, and modifications of belief on the subject of the government of the world, to find the influence of this belief on public conduct and human action, would be indeed a most interesting investigation. But then it would be one of appalling magnitude. To ascertain the prevailing opinions of any one age, say of any one century, is almost a life work for any man. For nothing less is required than a complete survey of all the extant literature of the period. To the physical labour of reading such a mass of material has to be added the nicest tact and acutest critical sensibility to detach from it the sentiment of which we are in search. It is a much easier proceeding to which historians of philosophy find themselves impelled. They start with proposing the problem as we have proposed it. But they soon find this idea too unsubstantial and elusive to bear historical handling, and the material vehicle in which it is held suspended hopelessly extended in volume. They accordingly renounce their original scheme, and confine themselves to giving an account of the books professedly published on the speculative part of their subject. This is also the course that Professor Flint's book has taken. His introductory chapter is his only general chapter. Only here does he attempt to deal with prevalent opinion as distinct from professional speculation. In this chapter he reviews history as conceived by the great Oriental nations, by the Jews, and among the Greeks. He then shows how the idea of universal history was the result of the Roman universal empire. Christianity introduced upon this the consciousness of a spiritual unity

* *The Philosophy of History in France and Germany.* By Robert Flint, Professor of Moral Philosophy and Political Economy, University of St. Andrews. Edinburgh and London: Blackwood & Sons. 1874.

of the human race, and the conception of a providential plan embracing an explanation of the degradation of the species, and holding out the means of recovery. The mediæval writers had not a sufficient acquaintance with the facts of history to frame a philosophy of history. Their history is biography. Individual actors, strong men armed, were the subjects of their narrative when it spoke of "the world," the virtues and prodigies of saintly men when it spoke of "the Church."

So far, for about sixty pages, we have a history of the philosophy of history on the theatre of the civilized world. The presentation has the fault of vagueness. It wants precision, and needs to be authenticated by the citation of the vouching texts. From this point onward we leave the public stage, and find ourselves confined to the books of the French and German speculative thinkers who have written professed treatises on the subject of the philosophy of history. This *résumé* of literature, including as it does an analysis of the contents of some five-and-twenty French and as many German books, makes a very useful compendium. Many persons will be glad to have such a manual for reference. Many of the books analysed, too, are written in a way which makes the reading of them fairly impossible. The books of wool-gathering German philosophers, childishly ignorant of the elementary rules of composition, are specially offensive in this respect. We are most thankful to Mr. Flint for the labour he has bestowed on giving in an intelligible form a summary of the speculations, or ideas, of Scholzer, von Müller, Kant, Schelling, Steffens, Görres, Krause, Lotze, many of whose books are either inaccessible or are too toilsome reading to repay the time it would cost to extract any valuable metal from the dross. If Herder and Lessing are much more widely known, this is due less to the intrinsic merit of their theories than to the lucid style which distinguishes their writings from the barbarous and pedantic jargon of their compeers. Lessing especially is a master of language. And it would be difficult indeed to believe that Albert Thaers, or any other than Lessing himself, could have composed the tract "On the Education of the Human Race," in virtue of which Lessing may be placed among those who have speculated on the philosophy of history. The style is our evidence. As to Lessing's theory—namely, that God acts as the educator of mankind by revelation, but that in so acting He does not displace reason, but elicits it—it must be regarded as a mere imaginative play of ideas, such as one of the Platonic Dialogues is, and not a legitimate deduction from the facts presented by the history of the world. It is not only unverified, but is incapable of verification.

The careful analysis of Bunsen's *God in History* will be acceptable to many whom the bulk of the three volumes may deter from the attempt to read them. There are other reasons too, besides mere bulk, which throw this remarkable book into the shade. The chief of these reasons is that the speculation it contained was largely built on the facts of comparative philology, and these facts were then too imperfectly ascertained to be the data of an induction as to the world's history. The conception which guided his researches into primeval history was a noble one, but the science was not ripe for his conclusions. He attended exclusively to the mental product of the race, overlooking its physical conditions. He studied man merely as what religion and language show him to be, and overlooked the equally important biological and ethnological considerations. Since Bunsen wrote, twenty years ago, the prehistoric ages have had more attention bestowed upon them than they had had in all the time previous. Hence Bunsen's labours have been but the work of a pioneer, and the great work of his life, the *Gott in der Geschichte*, the last work he lived to complete, but the first he conceived, is already in so short a space of time gone by. Indeed much of the speculation was crude even at the time. His division of history into three epochs—the Hebrew and Zoroastrian, which produced speech and mythology; the Greek and Roman, which produced poetry, art, and civil policy; and the third, the German and Romanic peoples, to whom he attributed science—are hasty inferences from arbitrarily selected facts. Bunsen as a man was much more admirable than as a philosopher; what he has left behind is the memory of a noble life, of a pure and aspiring soul, not any solid and enduring legacy of thought.

Another analysis brings a little-known name to the notice of English readers. Ernst von Lasaulx is a contrast to Bunsen. Bunsen, joyous and sanguine, looked confidently forward to the future of the race as sure to realize the Utopian dreams of philanthropists; to the time, near at hand, when the triumph of the divine principle upon earth is to be manifest and universal. Ernst von Lasaulx's thought, on the other hand, is pervaded by a vein of melancholy. He is overwhelmed by a sense of the nothingness of life, of the preponderance of the vain and illusory in human affairs. This deep impression of personal despondency is all that gives originality or interest to his views. Judging by Mr. Flint's exposition of them, they are in no relation to the facts of history. They are a mere succession of fanciful analogies, such as present themselves to an imaginative mind which habitually reviews the general course of things in a gloomy spirit. Like Roman Catholic writers in general, Von Lasaulx seems to be without any sense of scientific reasoning. He dwells on the thought that nations, like individuals, must in the course of nature die of age. Each nation has had allotted to it a certain amount of vitality, which must gradually develop itself in the formation of speech, religion, a constitution, art, metaphysics, &c. This original amount of force is of necessity thereby gradually exhausted, so that the nation has no sooner reached maturity than its powers begin to fail, and a process of decay set in, which inevitably ends in dissolution.

account is Conrad Hermann. His books are little known in this country. But no other living German thinker has occupied himself so long and so earnestly with this department of inquiry. His *Philosophy of History* (1870) has taken at least a quarter of a century to mature. According to Conrad Hermann the central problem of historical science is the relation of necessary law to personal freedom. Its solution must be sought, not by definition, or outside of history, but in an unprejudiced and comprehensive study of human development as a whole. Necessity and freedom are both present in history. The one does not exclude the other. Their co-existence is undeniable, but it is a riddle which he cannot solve. The course of humanity must be conceived of as a work of art. Hermann rejects the view that history is an organism, that its unity is that of a self-evolving principle. It is a system of means divinely arranged for the securing of spiritual ends. It is the work of a free, creative intelligence who has adjusted all with the purpose of preparing morally perfectible beings for another and higher life. The business of the philosophy of history is to show what adaptations of means to ends can be traced in the course of things, how part is adjusted to part, how all the parts are correlated into a system, and converge to a final cause. This is enough to show that Dr. Hermann's system has no scientific character about it, and is but woven of the same metaphysical stuff of which so many previous "systems" have been manufactured. Indeed, if we may judge from the rest of Mr. Flint's exposition, this latest system is very "loose thinking" indeed. We will hope that it is so cloudy as to be incapable of importation into this country. Dr. Hermann is obviously a man who loves truth and justice, but he has lamentably sacrificed both to what at present passes current in Germany for patriotism, a Teutomania not less irrational and pernicious than French "chauvinisme."

The present volume of the *Philosophy of History* is only an instalment. Another volume is to treat of Italy and England. It would enhance the value of Professor Flint's analyses of the books he has read if his style were a little more condensed. If, instead of the lectures as he delivered them, he would give us the "substance of lectures," the bulk of the volume might be much reduced, and a greater degree of precision of statement attained.

FITZGERALD'S BOSWELL.*

"THE most curious edition," wrote Johnson, "is commonly the first, and the most useful may be expected among the last." Language, if not thought, has strengthened since Johnson wrote, and Mr. Fitzgerald, going far beyond the consideration of what is most curious or most useful, declares that such an edition of Boswell's Life as he now gives us "has become an absolute necessity." Johnson, we remember, once scolded Mrs. Thrale for using the word "terrible" on some small occasion. We wonder what he would have thought of Mr. Fitzgerald's "absolute necessity." It is somewhat disappointing to find that a man can not only have read, but also worked at, the Life of that great master of exact language, and yet in his use of language can be so careless. Boswell was too eager in his boast that he had Johnsonized the land. His very editors, so far from thinking, do not even talk, Johnson.

Mr. Fitzgerald, however, has done good service in republishing the first edition of Boswell as it was originally printed. Whether, with Mr. Fitzgerald in the eleventh page of his introduction, we consider "Boswell's work as unbedded in a mass of concrete and rubble," or whether, with Mr. Fitzgerald in the nineteenth page, we consider the "information which has adhered to the sides and bottom of Mr. Boswell's fine vessel, and has certainly impeded its sailing powers," in either case we are glad of an opportunity of examining the work when freed from the concrete and rubble, and the vessel when cleansed from the information. We are not indeed so much indebted to him as many persons might be. We could never read Boswell in Croker's edition, or in any edition founded on Croker, and so we had been but little troubled with the work of the editors. Nevertheless it is an undoubted fact that most of those who think they are reading the immortal Life read, as Mr. Fitzgerald says, "a Life of Johnson, not Mr. Boswell's Life of Johnson." Each editor has thought himself at liberty more or less to alter the very text whenever he had some fact to add or some error to correct. Mr. Croker, of course, was the greatest sinner in this respect, though happily the mistake that he made is very easily set right, while the light that he threw upon many an obscure passage will shine as long as men delight in reading the first of all Lives. It is true, indeed, that the later editors of his great edition had cut out a good deal of the materials which he had interwoven with the text, and had given it in the form of footnotes. Nevertheless, even with their corrections, the text was very far from being as the author left it. All those then who delight in Boswell will do well to get this reprint of the first edition. Even if, like ourselves, they had already read a text which was not far from being pure, they will nevertheless, like ourselves, delight in having a good excuse for reading once again an old favourite. We are glad, on the whole, that it is Boswell's first and not his second edition that Mr. Fitzgerald reprints. We do not, indeed, quite follow him in the course of reasoning which leads him to this result, but with the result itself we are content:—

The artistic mode of dealing [he says] with such a miscellany would be to

* Boswell's Johnson. A Reprint of the First Edition. Edited, with New Notes, by Percy Fitzgerald, M.A., F.S.A. 3 vols. London: Bickers & Son.

present the original work, which in a certain sense was complete and homogeneous, and mark the distinct and transitional character of the alterations and additions by placing them on the same page, but in a different shape. That such is the logical course is evident from the fact that, if Boswell's last edition were reprinted "textually," the numerous Langton letters would figure as an appendix to the second volume.

Mr. Fitzgerald will perhaps say to us, in Johnson's words, "I have found you an argument, but I am not obliged to find you an understanding."

While we gladly accept this reprint, we cannot but regret that the editor has not been so successful in the execution of his work as he was happy in its conception. He has not merely given us a reprint of the first edition, but he has added new notes of his own. We wish we could say of his book what Johnson said of Lord Hailes's *Annals of Scotland*, "It is a book which will always sell, it has such a stability of dates, such a certainty of facts, and such a punctuality of citation." Mr. Fitzgerald has indeed a considerable familiarity with the literature of last century, but he has none of those exact qualities which gave its great merits to Lord Hailes's work. From him must be expected no stability, no certainty, no punctuality. As we read through his edition we soon felt the want of the date which in all the editions of Boswell that we had seen was given, together with the year of Johnson's age, at the top of every page. We remembered indeed that it was to be an exact reprint of the first edition. Nevertheless we thought that, as in the Bible the pages are often given in an obscure corner at the bottom of the page, so somehow or other might have been entered, in an apologetical kind of manner, those most convenient dates. What was our surprise, on consulting the copy of the first edition at the British Museum, to find that in it these dates were given throughout! An editor who is so careless about dates as to omit them wholesale in a reprint which professes the most perfect purity can never hope—we again quote Johnson—"either to fill the hunger of ignorance or to quench the thirst of curiosity." In his preface too he gives his references in the most inconvenient form. Most writers who refer to Boswell, aware of the vast number of editions that have been published, give not the page, but the month and year. Mr. Fitzgerald quotes the single-volume edition of 1862. There may possibly be people who not only possess, but who also read, Boswell in a single-volume edition, though we doubt it. Of this, however, we are sure, that any one who cared enough for Boswell to look out Mr. Fitzgerald's references would care too much for him to have him in the single-volume edition of 1862. We, at all events, were put to a great deal of unnecessary trouble in hunting out the passages in which we cared to follow Mr. Fitzgerald's lead. Again, the corrections made by Boswell in his second edition are given in a most inconvenient way. In page 395 of the first volume, for instance, at the bottom we find this note:—"Cor. et. Ad.—Line 3. For 'or' read 'nor.'" To the word "or" no mark has been put to call our attention to the correction in the foot-note, and so, when we reach the end of the page, we have, if we care to see the effect of the correction, to count eight lines down from the top to find the word that has to be altered.

When we come to consider the notes which Mr. Fitzgerald has struck out, and those which he has put in, we quite agree with him as to the general principle on which he goes. He says that we ought in each case to ask, "Would the information, or details, have been adopted by the biographer himself?" There were a great many letters and documents which Boswell no doubt would have inserted if he could have got at them. These certainly should be given in foot-notes or in an appendix. There are a good many errors which Boswell made, and which he would no doubt have corrected had they been brought before him. Of these errors notice should be taken. There are not a few matters which Boswell very properly left in a certain obscurity, out of regard for those who were living when he wrote. It is many years since, with equal propriety, light was thrown on them, for those had long passed away to whom consideration had had to be shown. Mr. Fitzgerald, however, has struck out much information that Boswell would have been delighted to get, has left in not a few errors that Boswell would have listened to correct, has made errors of his own into which Boswell would have been vexed to have fallen, and has left much in obscurity which previous editors had brought into light. We must at the same time do him the justice to admit that he has got together a considerable amount of now and interesting information. We wish he would have spared us such notes as the following:—"This noble piece" (one of Johnson's prologues) "contains argument and true dramatic principles, besides some majestic poetry," or "The whole scene" (Dr. Dodd's execution) "is full of a ghastly interest," or "This appears to be one of the most charming touches of character recorded by Mr. Boswell." While such notes as these are inserted, we find many omitted of great importance. We would instance Dr. Kearney's ingenious explanation of the passage where we are told that Mr. Scott (afterwards Lord Stowell) quoted what was said of Alcibiades by a Greek poet, and the Bishop of Ferns's correction of yards square for square yards.

Perhaps reasons of copyright may have compelled such a wholesale neglect of the information given by recent commentators, more especially by Mr. Croker; but no such excuse can be found for the errors that have either been left in the text, or have crept into it through the carelessness of Mr. Fitzgerald's printer. In page 398 of the first volume Mr. Fitzgerald says, "Though Boswell praises Mr. Baldwin for his printing, the two editions were printed carelessly"; and he goes on to say

that "the whole offered a unique specimen of typographical confusion. The above passage is thus jumbled." What Mr. Fitzgerald means by "the above passage" we cannot even guess. A near approach to it, however, we have found at page 422 of the second volume. Boswell certainly was no classical scholar, and no doubt in his first edition errors enough were made in his Greek and his Latin quotations. Though a reverential regard for an exact reprint of the first edition justifies a reproduction in the text of all the errors that originally appeared, nevertheless it neither warrants the insertion of fresh mistakes, nor forbids a footnote by way of correction. In one case where, in the diploma given by Trinity College, Dublin, we find two errors in the Latin within two lines, we ascertained that the former of these errors certainly occurs in the first edition, though Boswell had corrected it in the second. Mr. Fitzgerald, however, prints *Anna Domini*, and, to the confusion of the sex of the Fellows of Trinity, *singularum minus*. But what is that to the following wonderful piece of Greek? *αρις ον αν οιδε γυα ελκασσαν γενομενον*. We have not here referred to the first edition, but we doubt whether the fault is Boswell's. Not much inferior to this is "Η παρι σου οισωσι παρουν εις κρηνην. A curious typographical blunder which Boswell himself corrected in his second edition is left uncorrected in the edition before us. Our readers will remember how one evening, when Boswell teased Johnson with his reflections about death, he was dismissed with the stern command "Don't let us meet to-morrow." Boswell, however, ventured to visit him, having first sent a note in which he said that if he had been in the wrong it was not intentionally, and that, though he should call upon him, he would only stay five minutes by his watch. We will here quote from Mr. Fitzgerald's edition, which, as we have said, is the same as the first:—"I whispered him, 'Well, Sir, you are now in good humour'; Johnson, 'Yes, Sir.' I was going to leave him, and had got as far as the staircase. He stopped me, and smiling, said, 'Get you gone,' in a curious mode of inviting me to stay, which I accordingly did for some while." In the second and every following edition the passage is correctly printed, "'Get you gone,' a curious mode," &c. In the account given of the meeting between Johnson and his old college friend Edwards—the retired solicitor who had always found cheerfulness breaking in upon him whenever he tried to be a philosopher—an error in the text is left unnoticed. It was not nine-and-thirty years, as Boswell says, but nine-and-forty, since the two at an alehouse near Pembrokeshire Gato had talked of the Eton boy, and the single line that was wrongly assigned to him. But Mr. Fitzgerald, we fear, had he known Johnson, would have lain almost as much open as Mrs. Thrale to the reproach of being "careless of exactness." In one case, in noting a statement of Mr. Croker's about Hawkins's book, he says, "Boswell's work did not appear until several years after Hawkins's death." Now as Johnson died in 1784 and Boswell in 1795, and as both Hawkins's and Boswell's books were published within these years, it is at once seen that there must be no small exaggeration in the use of the word "several." It so happens, however, that the one book was published in 1787 and the other in 1791. Mr. Fitzgerald brings forward some curious information to show that Boswell was right, and Croker wrong, as to the duration of Johnson's residence at Oxford. But we have not space here to enter into the question with the fulness that it deserves. We shall hope to return to it on some future occasion.

We must, before we conclude, point out briefly a few of the other mistakes into which Mr. Fitzgerald has fallen. "The four lines from Shakespeare on 'the honest chronicler,' Griffith—usually prefixed and marked 'Boswell' by Mr. Croker—are not found," says Mr. Fitzgerald, "in the author's editions." Mr. Croker was quite right in marking them "Boswell," for they are given by the author in his second edition. In p. 331 of vol. 1, to the word "garretter" which occurs in the text, is given a note, "This madman eloped," &c. It was not the "garretter," but Mr. Hervey, who eloped. In the next volume, in a note on Lady Galway, we are told:—"This wonderful old lady was alive in 1840. Mr. Croker, who was acquainted with her, has a very pleasant note on the subject." It was not Lady Galway, but her daughter, the Countess of Cork, whom Mr. Croker knew. As the daughter was born in 1747, her mother must have been a very wonderful old lady indeed if she was alive in 1840. In his first edition, Boswell had "unadvertently on Dr. Smollett's ignorance" for having called, as he thought, Johnson "that great chum of literature." In his second edition he had done his best "to propitiate the *manes* of that ingenious and benevolent gentleman," by owning that chum was certainly a mistaken reading for Chum. He goes on to add:—"For this correction I am indebted to Lord Palmerston; whose talents and literary acquirements accord well with his respectable pedigree of Temple." Nevertheless, in a later part of the same volume we find the following passage, without a word of comment:—"You will find in my second edition a correction of *chum* to *charm*, suggested to me by Lord Palmerston." Surely Boswell in this letter, which Mr. Fitzgerald gives in a note, must refer to the passage we have just quoted. But what would the *manes*, if *manes* in such a case there be, of that other ingenious and benevolent gentleman, David Hume, say, when he finds his name printed by Mr. Fitzgerald in one of his notes Home? Has he never read the philosopher's will, and does he not know that a legacy depended on whether Home was spelt Home or Hume?

We have yet to wait before we shall see such an edition of Boswell as Boswell deserves. Mr. Fitzgerald, in spite of all his faults, has made a step in the right direction. We hope the day may come when to the text of the first or second edition may

be added all the curious information that has been gathered by a long line of commentators. We shall then have a work which, while it will be no less curious than the first edition, will be acknowledged to be the most useful among the last.

STUBBS'S CONSTITUTIONAL HISTORY.*

(Second Notice.)

WE have already given some notion of the general object and character of the new work of the Regius Professor of Modern History; we will now go on to follow him somewhat more minutely through the main course of his volume, and to dwell on some points more in detail.

He begins, as we have said, with the beginning. His opening chapters give the results of the last researches into the Teutonic antiquities of the mainland. Then he comes to "the migration," the settlement of the Angles and Saxons in Britain. Here he stops to contrast the English Conquest of Britain and the Frankish Conquest of Gaul, pointing out the differences between the position of the conquerors in the two cases, and the differences in the state of the lands into which they severally came. All dreams of deriving anything English from anything Roman or British are of course cast aside. All that Mr. Stubbs admits is that a few of the greatest cities, like London and York, kept up a continuous existence, though we need not say that he gives no ear to the phantasy which tries to trace up English municipalities to a Roman source. The completeness of the national migration is strongly put forth by Mr. Stubbs. The English invaders brought with them into Britain all that they had on the mainland; their life in Britain was simply a continuation of their life in Germany, modified of course by the circumstances in which they found themselves in their new country. They brought over their wives and families, they brought their slaves, and, as Mr. Dawkins showed some years back, they brought their cattle. "The tribe was as complete when it had removed to Kent as when it stayed in Jutland; the magistrate was the ruler of the tribe, not of the soil; the divisions were those of the folk and the host, not of the land; the laws were the usages of the nation, not of the territory." He then goes on to trace the state of things after the settlement, the tenure of land and the classes of men; but Mr. Stubbs holds that Mr. Kemble has exaggerated somewhat with regard to the mark, the name of which is so rare in England. The truth doubtless is that the English at the time of their conquest had got beyond the earliest form of the mark system, and the mark could hardly have in any case kept up its original independence under the circumstances of the conquest. Mr. Stubbs nevertheless sees large traces of the mark in all our local institutions, and specially in those manorial courts and their various incidents which at first sight have such a feudal look, but which have really grown out of the village community. The lord has stepped in within his range, just as the king stepped in within his wider range, and in both cases the tendency of later times has been to return under other forms to the primitive state of things. The traces of the mark as an administrative unit are fast passing away among us; but they are passing away, not by increased subjection to lords, but by merging into larger self-governing bodies. In England the aspect of the township and the parish outgrew the aspect of the mark. "The historical township," says Mr. Stubbs, "is the body of alodial owners who have advanced beyond the stage of land-community, retaining many vestiges of that organization; or the body of tenants of a lord who regulates them or allows them to regulate themselves on principles derived from the same." Mr. Stubbs works out the history of the township in early times, and the township leads him up to the burh, the origin of English cities and boroughs. The English borough, like all other things English, has come of itself. It was not in its beginning an organized political society like an ancient Greek colony; it differed from the village community only in being more thickly inhabited and defended for military purposes. These circumstances caused its institutions to take the form of those of the hundred rather than those of the mere township. Through the hundred he gets up to the shire, and here Mr. Stubbs points out the different way in which the shire arose in different parts of England, and also points out how, alongside of the ordinary hundreds, there were also, hundreds or liberties under separate, most commonly ecclesiastical, jurisdiction; that is to say, the lord had crept in here also as well as on a greater scale in the kingdom, and on a smaller scale in the manor. Lastly, at the end of the fifth chapter, Mr. Stubbs points out that when, under Canute and afterwards, several shires were united under a single earl, it was rather a case of plurality than of union; the earl was still earl of each shire separately, and held the usual courts and assemblies of each without having any general court or assembly for the whole land under his jurisdiction.

In his sixth and several following chapters Mr. Stubbs deals with the political side of the Old-English institutions, and the stages of their development, with the King and his Witan, the origin and the extent of their powers, and the way in which those powers and the manner of their exercise gradually changed. This last point brings us up to one of the greatest merits of Mr. Stubbs's book. Even people who are not among the most ignorant people, who do not

believe that all "the Saxons" lived at the same time, are apt not to take in the great changes in political and social respects which took place within the first six hundred years of our history. These changes, parts of a change which was going on everywhere, have never been worked out with greater clearness than they have been by Mr. Stubbs. The general result he thus puts:—

The general tendency of the process may be described as a movement from the personal to the territorial organisation; from a state of things in which personal freedom and political right were the leading ideas, to one in which personal freedom and political right had become so much bound up with the relations created by the possession of land, as to be actually subservient to it: the Angel-cynn of Alfred becomes the Engle-lande of Canute.

He then traces out the stages, showing that the English and Briton never were in the first stage, the stage where everything is personal, when territorial notions had not come in at all, because that stage of our national life had already been passed before we left the mainland. On the other hand, he shows that the last stage of the process, that which led to the fully developed feudalism of the Continent, was never reached in England left to itself. This final step was taken, as Mr. Stubbs says, by the Norman lawyers, not by the English Kings; the change of which the change in the royal style from "Rex Anglorum" to "Rex Anglie" was the outward sign, was undoubtedly, as Mr. Stubbs says, the work of lawyers more than of anybody else. We had got so far on the road towards feudalism that it needed not so much any formal legislation on the part of the Conqueror as the bringing in of a new way of looking at things, a crowd of legal fictions and of legal subtleties, to make England feudal so far as it ever became feudal. But then comes in a most important distinction which runs through the whole of the changes which the Norman Conquest brought about, and which makes that great event and its results so striking a comment on the saying of Themistocles, "We should have perished if we had not perished":—

They left the ancient local organisation unimpaired, out of which a system was to grow that would ultimately reduce the landownership to its proper dimensions and functions. If the system had in England ripened into feudalism, that feudalism would in all probability have been permanent. Happily the change that produced feudalism for a time introduced with it the necessity of repulsion. The English, who might never have struggled against native lords, were roused by the fact that their lords were strangers as well as oppressors, and the Norman kings realised the certainty that if they would retain the land they must make common cause with the people.

In another chapter Mr. Stubbs deals with the ecclesiastical history of the time, pointing out the strictly national character of the English Church—national, not only in being comparatively free from foreign interference, but national also as being the chief tie which bound the different parts of the nation together—"national," as Mr. Stubbs says, "in its comprehensiveness as well as in its exclusiveness." "Englishmen," he goes on, "were in their lay aspect Mercians or West-Saxons, only in their ecclesiastical relations could they feel themselves fellow-countrymen and fellow-subjects." So again he goes on to trace the influence of the Church in keeping up English nationality after the Norman Conquest:—

The unity of the church was in the early period the only working unity; and its liberty, in the evil days that followed, the only form in which the traditions of the ancient freedom lingered. It was again to be the tie between the conquered and the conquerors; to give to the oppressed a hold on the conscience of the despot; to win new liberties and revive the old; to unite Norman and Englishman in the resistance to tyrants, and educate the growing nation for its distant destiny as the teacher and herald of freedom to all the world.

Almost the only point on which we should be inclined to question Mr. Stubbs's notions is with regard to the constitution of the Witenagemot. He holds that, while the smaller assemblies of the township, the hundred, and the shire were strictly primary assemblies, the great council of the nation had another character, and was, not indeed strictly speaking representative, but certainly select. We have always held, on the other hand, that in theory the Witenagemot was an assembly of all the freemen of the kingdom, just as the assemblies of smaller districts were assemblies of all the freemen of those districts; but, by the very nature of the case, the assembly would on all ordinary occasions shrink up into an assembly of the chief men, enlarged when some exciting question was afloat, and, when the assembly was held in a large town, enlarged by an unusual concourse of the citizens of that town. Under this head, to take one instance only out of many, come the many cases in which the citizens of London take a share in the election of Kings both before and after the Norman Conquest. But Mr. Stubbs admits that on such special occasions large bodies of men did come together, and, if they did not actually deliberate—which they are not likely to have done in any case—at least gave their assent to what the chief men had voted. The two views come practically to much the same thing; it is rather a difference as to the theory of the assembly than as to its actual working. We do not see how such phrases as "all folk," "all the people of the land," and such like, which we find applied to elections of Kings and the great national acts, can be explained except by supposing that every freeman had an abstract right to attend, and that, on certain special occasions, that right was actually exercised by large bodies of freemen. It is such a rare thing to find even the smallest mistake in Mr. Stubbs that, as we have mentioned a difference of opinion, we may mention a single case in which he has gone wrong in a date. In page 282 he speaks of certain bishoprics, Exeter among them, as being in the hands of foreigners in the year 1070; we need not

* *The Constitutional History of England in its Origin and Development.* By William Stubbs, M.A. Vol. I. Oxford: at the Clarendon Press. 1874.

go further than his own "Registrum Sacrum Anglicanum" to show that Leofric kept his own bishopric till 1072.

The nature and effects of the Norman Conquest were never better set forth than they are in the present volume. Mr. Stubbs thoroughly feels how the Conquest and all that came of it were affected by the fact that William claimed the crown by legal right. This at once distinguishes the Norman Conquest, with the gradual confiscations of land which followed it, from the conquest and parting out of a large part of England by the Danes at the end of the ninth century. The general results he thus sums up in a remarkable passage:—

The adventurous and highly-strung energy of the ruling race communicated itself to the people whom it ruled; its restless activity and strong political instinct roused the dormant spirit and disciplined even while it oppressed it. For, in the second place, the powers which it called forth were largely exercised in counteracting its own influence. The Normans so far as they became English added nerve and force to the system with which they identified themselves; so far as they continued Norman they provoked and stimulated by opposition and oppression the latent energies of the English. The Norman kings fostered, and the Norman nobility forced out the new growth of life.

He then traces out the gradual changes in the system of law and administration, and especially in the tenure of land, which were brought in by the highly trained officials who grew up under William and his successors. To them we owe the gradual introduction of the military tenures, of which, to the confusion of those who draw their notions of history from lawyers and popular books, there is no trace in Domesday. The oath of Salisbury, by which every man in the kingdom became the man of the king, is put by Mr. Stubbs in its true light; so far from being, as many have dreamed, the introduction of the feudal system, it was, as Mr. Stubbs shows, a measure distinctly anti-feudal. It was a measure taken to keep England from that great evil of feudalism by which personal duty to the immediate lord was allowed to overshadow the higher duty to the State, and to the King as its chief. This great law, and the doctrine out of which it sprang and which it strengthened, certainly did more than any one cause to keep England from falling under as France and Germany did. So Mr. Stubbs goes on, tracing in all points the gradual effects which the new notions had, and how they worked their way step by step much more as a matter of administrative procedure than of formal legislation. One point which he especially brings out, and which stands in close connexion with the Salisbury oath, is the very sparing way in which the Conqueror bestowed earldoms. He had no mind to create, or even to continue, any power which could in any case become a rival to his own. He had no mind to have anyone in England who should stand to him in the same relation in which he himself stood to his own over-lord at Paris. He continued for awhile those of Edward's earls who submitted to him, but, when they were got rid of, he gave them no successors. There was never again an Earl of the Mercians or Northumbrians in the same sense in which those titles had been borne by Edwin and Morkere. Nor did he fall back on the older practice of planting an earl or ealdorman in every shire. Earl, "Dux," "Comes," were names which suggested ideas which had been found dangerous on the Continent, and he preferred to put the management of the shires under the care of his own personal officers, the sheriffs. It was only on the dangerous Scottish and Welsh borders and in Kent, which events showed might pass as a Picard border, that William allowed earls as a kind of necessary evil; and two of these, it should be noted, were Bishops, who could not found dynasties. Mr. Stubbs points out that the title of earl has been wrongly given to several of William's followers who received vast grants of land, and whose descendants in some cases grew into earls, but who did not hold earldoms under William himself. And all William's immediate successors, except Stephen, the first creator of *pseudo-comites*, followed the same policy.

We have traced Mr. Stubbs through only about half of his book. That half may be taken as a specimen of the whole; but this is not quite all. An examination of the earlier part is more necessary. Mr. Stubbs has in his Prefaces shown himself master without rival of the Angevin period. In this book he has shown himself to be equally master of the periods which went before it. We have therefore chiefly confined our more minute examination to the times of which he has said less in his earlier works. The masterly sketches in his *Select Charters* showed his grasp of the general subject; the present volume shows his knowledge of the minutest details. Of the later parts of the present volume we will only say that they worthily continue the parts of which we have specially spoken. We shall look anxiously for the remainder of the work. Up to the time which he reaches in this volume, Mr. Stubbs really stands alone. No one before him has dealt with the constitutional history of England from the earliest beginnings to the Great Charter in a manner at once scientific and systematic. In later times he will find more formidable rivals. He will have to grapple with the lawyers on their own ground, in times when their technical knowledge becomes really a help and is no longer a hindrance. And we shall be specially anxious to see whether, in dealing with times beset with controversies which come more home to modern passions and prejudices than the controversies about earlier times, Mr. Stubbs can still keep the same wonderful calmness, the same perfect readiness to do justice to all sides, which he has shown in dealing with the first eight hundred years of English history.

L'EAUFORTE EN 1874.*

THIS is a better collection of etchings than most of those which have been issued by the same publisher. M. Cadart has done a great deal for the revival of etching in France, but there has generally been this cause of limitation to his usefulness, that whilst he published many plates that were really valuable, he also published many others that could not but convey a very unfavourable impression of etching to the public mind. This was the more to be regretted because etching is not naturally a popular art; it is not an art which the general public naturally and easily understands; so that the general public, when it sees a bad etching, does not think "that is a bad plate," but it thinks "that is an etching, and really what a disagreeable art it is!" In this way the art has been held responsible for a great quantity of defective work done by people who had never mastered it; and something of this unfortunate result is due to M. Cadart, who brought out into the glare of publicity a number of plates which ought to have remained for ever hidden from human eyes. We see now with the greatest pleasure that he is becoming more severe in his choice of artists. Every plate in the present set of thirty is worth having, and some of them are as good as anything done of late years, except the work of one or two quite exceptional geniuses. M. Burty, the well-known French critic, has written an interesting introduction, giving an account of the recent history of the art, showing the state of total neglect into which it had fallen under the First Empire, and the circumstances of its revival. Etching was a living art in France long before the era of Napoleon, and yet it not only languished, but actually died out, so that modern etching is not a continuation, but a resurrection:—

Si une école de Peintres eût dû ne jamais se désintéresser d'un mode de traduction rapide, coloré, étonnant, cursif en quelque sorte, infiniment varié, toujours personnel, c'était assurément celle des Peintres français. Et cependant l'auferste, qui nous avait donné Callot et Della-Bella, Saint-Iny, Israël Sylvestre, l'illustre Claude le Lorrain, puis Gillot, Boucher, Gabriel de Saint-Aubin, Fragonard, pour ne citer que quelques-uns, l'auferste ne survécut point au triomphe de l'école de David. Le réformateur et ses élèves, en réagissant contre les grâces aimables et la décoration du XVIII^e siècle, proscrivaient du même coup tout ce qui n'était point de doctrine austère. Le Burin, aux travaux disciplinés, devint la gravure par excellence.

It is curious that Ingres, who was a pupil of David, and quite as austere as his master, once etched a plate which in its own severe way was successful—the portrait of a bishop—and that this plate should have remained isolated. We think that although it is true, as Mr. Burty says, that etching "dit tout ce que l'on sait lui faire dire," there is after all a genius of etching, as there is a genius of the English language, and that the mind of Ingres would not naturally be in accordance with the genius of etching, just as the mind of some thorough Frenchman would not be in accordance with the genius of English. It appears to us that the etched line lends itself much more to the romantic or naturalistic temper than it does to the classical temper, and that the burin is quite the natural interpreter of an artist who accepts the classical discipline. If this view be correct, it is not surprising that the art of etching should have been unpractised by the classic schools, or by any one so long as their doctrine was predominant. In 1831 Charles Lenormant, a clever art-critic of that time, had the idea of illustrating his articles by means of lightly-sketched etchings on copper, and Alexander Decamps, brother of the famous painter, carried out the same scheme in 1834; but unluckily only a few copies were printed directly from the plates themselves, the large impression being more cheaply reproduced by a lithographic transfer which necessarily lost much of the quality of true etching. Eugène Delacroix resorted to etching, but did not practise it much. Marihat, Decamps, Paul Huet, and others employed it more or less. Célestin Nanteuil employed etching skilfully for picturesque figure compositions, and Paul Huet made good use of the same process in landscape.

M. Burty tells us that Huet was the first Frenchman who appreciated Constable, the founder of modern French landscape. Constable tried etching a little, and it is much to be regretted that he did not live in the midst of a vigorous *renaissance* of the art which would have carried him well over the practical difficulties. Constable never became an accomplished etcher in his own person, and yet the nature of his talent as a painter had an indirect influence on the revival of etching by carrying modern landscape art into grooves which inevitably led the painters towards etching. Paul Huet tried all the means for the multiplication of drawings which were known at that time; he tried lithography, wood engraving, and etching. In the last he became eminently skilful in quite a peculiar way. He learned it of Jeanron, a clever and persevering "chercheur," as M. Burty calls him, and Jeanron was also the teacher of Charles Jacque. M. Burty thinks the only modern to be compared with Huet in certain qualities of landscape drawing, "pour l'élégance du jet des branches, le modelé accidenté des troncs, la poésie aristocratique du site, le rendu des reflets dans les eaux calmes," is our countryman, Mr. Seymour Haden. In our opinion both Paul Huet and Mr. Haden are distinguished for their poetical sense of landscape; but we consider Mr. Haden's method as an etcher superior in this, that it is more simple, complete, and synthetic. Paul Huet employed a multitude of little touches where Mr. Haden employs the more continuous line.

After Paul Huet came Charles Jacque and Méryon, and then

* L'auferste en 1874. Trente auferstes originales et inédites par trente des artistes les plus distingués. Texte par Ph. Burty. Paris: Cadart.

began that large production of etchings which has been so much encouraged by the establishment of M. Cadart's publishing house, almost entirely dedicated to etching, and also by the two art publications, *L'Artiste* and *La Gazette des Beaux-Arts*, which admitted etchings as their principal illustrations. We may just observe, in passing, that the sort of encouragement given by M. Cadart is in one respect more advantageous to etching as an independent art. The plates in the *Gazette* are almost always copies from pictures; whereas M. Cadart's publications—as, for example, the one before us—are original conceptions of the etchers themselves. The reader at once perceives the difference in the effect upon the art. Suppose, for example, that water-colour painters were employed only to copy oil-pictures; it is evident that the peculiar merits and qualities of water-colour would have a less chance of complete development than they have when water-colour is encouraged as an independent art. It is especially for this reason that M. Cadart has claims upon our gratitude, and he has certainly never issued anything less open to objection from the critical point of view than the portfolio of etchings now before us.

The first plate is by M. de Rochebrune, and represents the chimney-piece of his own studio. M. de Rochebrune is a nobleman-artist, who lives, when in the country, in a grand old château of his in La Vendée, and his studio is one of the finest rooms in the château. The chimney-piece is a magnificent piece of highly picturesque, semi-barbarous Renaissance work, a great mass of elaborate sculpture with very big stone griffins for caryatides, coats-of-arms in the upper panels, and other caryatides between them. The fire-dogs are tall iron harlequins with shields and clubs. The plate is a large one, and thoroughly well done, in a firm decided way, without any trace of the amateurship which might have been expected under the circumstances; for it rarely happens that a man is at the same time proprietor of magnificence of this kind and artist enough to reproduce it so effectively on copper. The plate is as well and decisively bitten as it is firmly and solidly drawn. M. Jules Héroau gives an omnibus station at Paris with a snow effect, which is well conveyed in a few lines. Célestin Nanteuil has a highly finished study of an Italian female model in national peasant costume, entitled "Jacintha," treated delicately in the flesh and powerfully in the drapery. M. Lalaune has a clever sketch of Concarneau, Finistère, done in his old manner, which we decidedly prefer to the more recent manner he has adopted in working from pictures; in this plate the light-and-shade is cleverly suggested, but not carried beyond suggestion; whilst the play of line is arteable as a *croquis*. A rather simple piece of landscape by M. Yon, entitled "A Saint-Ouen," the subject of which is nothing but a very flat bit of river scenery, with low shrubs and trees, and a man in a punt, is very prettily composed, and has much of the completeness of a picture. M. Hédouin, who is one of the most thoroughly accomplished etchers in France, has drawn two young ladies, one of whom is examining a flower, whilst the other is looking at it over her shoulder; anything more charmingly delicate than this plate, whether in sentiment, composition, or execution, it would be difficult to imagine. It unites a rare refinement of design with the most skilful management of lights and darks, and is, in the way of delicacy and skill, the gem of the whole collection. M. Chauvel's landscape, "Environs de Rouen," a scene by the river under a passing shower, is as simple as possible in arrangement and in biting, and would be perfectly successful had the foreground been more thoroughly studied and not quite so heavy in execution. M. Charles de Gravesande (a French form of his real name, which is Carel van S'Gravesande) is a young Dutch artist who has already published a portfolio of admirable etchings, and he contributes to the present publication a plate entitled "Au bord du Vecht, Hollande." It is composed of the usual Dutch materials, a windmill, water, trees, and a sailing-boat, but we rather miss the low Dutch distances which are often so agreeable in scenery of that kind. It seems to us that this scene, though not without beauty, is rather too much shut in by the trees on the second plane, but the water is excellent and not at all over-laboured. As M. Veyrassat is a contributor, the reader is already aware that his plate must necessarily represent the opposition between a white horse and a dark one, and that the horses are of the heavy useful breed which belongs to M. Veyrassat as a sort of personal property. We suspect that he keeps two horses of this kind, a white one and a black one, in his own stable, and has them out every day to study from, he draws them so often and so well. M. Bonvin contributes a rather strange-looking yet truthful study of "Bords de la Rance, près de Dinan," which we perceive at once to be a little river estuary near the sea. The subject is lighted rather violently from above by sky-light, so that we have a very light foreground, represented mostly by white paper, light gunwales to the boats, and a dark screen of rising land on the other side the water, the temper of the work being that of intense veracity. M. Legros has chosen for his subject the fable of *Le Bonhomme Mièvre*, which, by the way, has been told at length in verse imitated from Lafontaine by the Chevalier de Chatelain. The legend is that the old man Poverty, one summer evening, received in his wretched cabin the visit of Saints Peter and Paul, who in return for his hospitality, such as it was, offered to grant any wish he might express. "Robbers steal pears from my pear-tree," he answered; "grant then that whoever climbs the tree may be unable to get down again without my permission." Death came to call on the old man, who craftily induced him to climb the tree, and then kept him there till he promised to let him alone for ever; hence the perpetuity of Poverty that never dies out from the surface of the earth. The

execution of this plate is simple in the extreme, and it may be specially mentioned as a good specimen of the kind of etching which a painter may do at once without apprenticeship to the refinements of the craft. It is excellent in its own plain way, but bears the same relation to highly artificial modern etching that a Dürer woodcut bears to clever modern wood-engraving. Beauty is not its object, still less prettiness, but it is full of expressional power and awful ghastly invention. Of all the plates in this collection it is nearest in spirit to the weird imaginative work of the early Germans, and, considered merely as handicraft, is far preferable to the sort of finish which is not only common in these days, but vulgar in itself and in its appeal to the tastes of the vulgar.

Not very much is to be said of M. Lançon's "Old Lion" but M. Lançon has often drawn animals with remarkable skill and knowledge, and a semi-failure scarcely diminishes our general confidence in the artist. M. de Nittis has etched "*La Danseuse Holoke-to-Zen*" in a way that is perfectly provoking—so well and so badly; there is a fine evanescent quality of light-and-shade, and such a suggestion of rich texture and colour that we are reminded of a fine colourist's work in oil; yet at the same time there are downright outrages against good taste, most notably in the horrible arm, which is so placed as to make it as hideous as possible, and so shaded that it looks neither feminine nor even human. M. L. Petit, who is well known as a clever caricaturist, gives us two scenes of the middle ages from a caricaturist's point of view, rather disgusting in some details but really lively and skilful. One of the least satisfactory plates in the collection is the Tomb of Mary Queen of Scots in Westminster Abbey, by M. Ballin, in which the architecture is not very well drawn, whilst the light-and-shade is rather confused. Elaborate architectural subjects of this kind are difficult to manage satisfactorily; they require such perfect precision of hand and such clever arrangement of light to keep them well together. M. Martial's "*Ancien Paris, Rue Saint-Eloi*," is much more satisfactory in these respects; but there are, or used to be, many much richer subjects in old Paris, and M. Alfred Taïe has hit upon one of them in "*Les Vieilles Maisons du Pont Neuf*," whose roofs are a wonderful accumulation of chimneys, galleries, and dormer-windows. Yet we cannot help observing what a pity it is that M. Taïe does not submit himself to a course of linear perspective, his drawings, as in the present instance, being generally disfigured by glaring errors in this respect. M. Détaillé contributes a very fine spirited sketch of a Prussian lancer on horseback, and the tree-trunks in the foreground of "*Le Lac Nemi*," by Jules Laurens, are full of masculine power. On the whole, the collection is greatly above the average of contemporary work, and may be said to steer fairly clear of the Scylla and Charybdis of etching, which are the unmeaning scrawl in line, and the superfine over-laboured shading.

STRANGE'S DEVELOPMENT OF CREATION.*

WE have had many a time of late to speak of applying the curb to the use of the imagination in matters relating to science, to which faculty there has been a tendency on the part of some high authorities to allow over much of the rein. A protest or caution of this kind becomes the more necessary in proportion as the groundwork of technical training and discipline is wanting, or as the sense of responsibility caused by a public position or by the profession of a teacher is not felt as a check upon the fancy. The amateur who at the worst has but to be laughed at, or the retired man of office or business whose leisure must be filled up somehow, will be just in the mood for a caper amid woods and pastures new to the sense of curiosity, and for a flight of the imagination amongst the mysteries of time and space. He will be ready any minute to rush in where angels fear to tread, and to come out with some spick and span theory of creation from beginning to end, or some cut and dried system of universal science. It must be very pleasant to sit in an armchair with a batch of the newest and most advanced books of scientific discovery or speculation, and set to work outdoing them all in novelty and grandiosity of scheming. The received thing nowadays with writers of this sort seems to be to begin with a fling at the ancients all round, picking in particular a lot of little holes in the Bible, the biggest of which were long ago picked with far more point and penetration by Tom Paine; and, by way of making up, we presume, to the world for the loss of its worn-out beliefs or usages, to startle old-fashioned folks by the most thrilling sensation yet proclaimed in the name of science. Trying the Bible as a manual of geology, they tell us with pity how sadly it is behind the age. Happily they are kind enough, like the writer of the work before us, to supply the void. "The Biblical representations having been exposed as untenable, it has become a necessity with most instructed persons to frame upon the ascertained facts some surer ideal of the mode in which the creative processes have been carried on, and to form some conception of the true probable periods involved in bringing them to their present stage of development." We all know the pomp and roll of words with which the "present enlightened generation" is set down to its lesson. "The scenic view suits the sentiments of an uninstructed mind, and was devised in days of unavoidable ignorance. The comprehension of the well-ordered,

* *The Development of Creation on the Earth.* By Thomas Lumisden Strange, late a Judge of the High Court of Madras. London: Trübner & Co. 1874.

truly-balanced, never-ending correlation of forces, with their perpetually diversified results, feeds the apprehensions of those who have better discernment. . . Our privilege is to contemplate"—and so forth. "Mind your pronouns, young man," was Dr. Parr's rebuke of an earlier outburst of this sort. What terms would the blindest old scholar, we wonder, have applied to a writer who speaks of the "actual processes of *elimination*" as among the triumphs of the new learning, and later on of the "elimination of forms from pre-existing materials"? We hear a great deal, from writers who are for ever decrying the old learning, of the inferiority of the study of languages compared with that of physical facts. It were well if they made sure of a little at all events of the lower knowledge in themselves before going on to set us all right in a manner which they think befits the present enlightened generation.

Such is the office undertaken by Mr. Lumsden Strange, who has followed up sundry little tracts upon Biblical difficulties with a couple of essays introduced in the words we have quoted, in one of which he demolishes in forty pages the whole Darwinian theory, and in the other builds up, within fifty pages more, a new theory of the antiquity of the earth and its human inhabitants. A series of extracts from well-known manuals and treatises of more or less value are woven together, with but a slender thread of the compiler's own spinning, into a fair enough summary of what may be considered the generally recognized processes through which the crust of the earth has passed to its present condition, and been peopled by its existing flora and fauna. But the writer seems impatient of the caution which tends to restrain most original thinkers and observers within the limits of experience or verification by fact, and is prepared to advance nearer to the primary source or fountain-head of life on the globe. The multitudinous and often conflicting results of observation in the lower sphere of life, amongst the infusoria in particular, satisfy him of the existence of a cause or power of coming into being independent of and anterior to parentage. The experiments of Dr. Bastian and others seem to him conclusively to forbid the idea of germ germination, and to make it clear that alterations wrought upon the material components of organized bodies by influences affecting them from without, and not an ever-varying and never-failing supply of germs, give rise to the several forms of simple life and their changes, in which the animal and vegetable blend indistinguishably together. Though professing to discard, with Dr. Bastian himself, the term "spontaneous generation" as incorrect—the ultimate spring or source of life, or any principle of true spontaneity in matter, being beyond attainment, or even mental conception—Mr. Strange unequivocally proclaims himself of that school which holds to the evolution of living out of lifeless constituents. He seeks to pin the upholders of the opposite, or germ, theory to the rule that sexual intercourse is necessary to reproduction. It is "ordinarily necessary," at least, he makes them say. But he goes on to make a point of propagation by fissure and germination, as if that class of facts were fatally opposed to it. "Even fertile germs being induced sexually, there is evidence of perfect forms being introduced without the operation of the sexes, though the one system by advanced developments passes into the other." The theory to which he is led by the results of the most recent investigation is that "all forms have been composed originally out of the surrounding elements, and, when established persistently, are constituted to continue themselves by sexual generation."

Thus far we have not got much beyond the stage of the *Vestigien*, save in the richer and more definite means of illustration furnished by the advance of special studies. It is far from clear that we have finally disposed of the time-worn scholastic problem, Which was first, the egg or the hen? for even Mr. Strange concedes that there could be no operative germ without a preceding germ-producer. He, however, not only plunges into the deepest arcana of life, but soars to its higher flights. Only the lowest forms of vegetation and animals are included in the operations we have hitherto been concerned with. "The question is, Have the higher forms been similarly produced?" Mr. Strange is ready with the answer. "Our familiar experience of life evolved from germs and embryonic forms generated by the means of sexual intercourse, gives us indeed the rule of reproduction governing the existing species; but it will not account for the first introduction of these species, which necessarily was effected without antecedent parentage." The higher infusoria have also, we are told, been brought finally under the law of heredity, but yet "we know there was a time when they were composed and endowed with life without the intervention of parents. The germ is in their instance not a primary, but a secondary condition." We are warranted then, Mr. Strange thinks, in concluding that the superior races, including, we presume, our supreme selves, have in like manner been brought into being:—

The causes that have served to introduce the infusoria may be those likewise to which the higher orders owe their primitive existence, their law of sexual reproduction becoming established among them when, as with these infusoria, they had attained their ultimate perfected forms.

Men of the highest science have professed themselves unable to entertain in thought the beginning of anything. With Mr. Strange "the beginnings of form have been continually given forth."

And we to think that the rule operating in the instance of the infusoria, and of all vegetation, small and great, is not the rule that occurred when the higher forms of animal life were introduced to stock the globe?

Mr. Darwin has been unfairly abused for dogmatism in seeking to account for all varieties of the animal creation by descent and transmutation from some one or few primitive humble organisms. Yet how this could have been effected he is modest enough to avow

himself wholly unable to conjecture. Mr. Strange, who thinks poorly of the Darwinian hypothesis, sees his way out of this difficulty by the aid of a suggestion of Mr. St. George Mivart's. "All geographical difficulties would disappear if we could concede the independent formation in different regions of all the organic frames, however high in the scale of nature, equally as may be conceded as to the infusoria." "If," indeed! To the advanced intelligences in whose name our author speaks there may seem no more difficulty in making a man than a monad. It is but adding another link to the chain, and the new link may logically cohere with the links preceding it. Still, when the chain becomes, in more senses than one, so much the more weighty with every link added to it, it behoves us to look more carefully whether the first link of all is securely forged and fixed.

In his second paper Mr. Strange starts with a brief but very excellent summary of the evidence of vast local changes of climate upon the earth's surface, and of a corresponding range or variation of life in plants and animals; with especial reference to the relics of man, both by way of imbedded bones and fabricated implements, extending back to an antiquity commensurate with these mighty cycles of temperature. How are we to account for those vast alternations which have left ice-borne boulders or glacial striations as near the equator as Madras, or two degrees across it on the American continent, with *débris* of a subtropical fauna and flora as near the pole as observation has hitherto been found possible? How, again, are we to explain phenomena like those displayed by Kent's Cavern, where the uppermost black mould is underlain in succession by three floors of stalagmite, between which have been deposited a second land of black mould and two or three feet of brown breccia; the whole interspersed with remains of animals differing in species but now extinct, the breccia stratum including human remains, as well as blocks of limestone, some of great size, fallen from the roof? Mr. Strange dismisses as inadequate the view represented by Sir Charles Lyell, that changes in the massing of land round the poles and along the equator, together with the resulting alternations of oceanic and aerial currents, have brought these great effects to pass. Neither does the variation in the ellipticity of the earth's orbit, nor the admitted degree of varying inclination of her axis, nor any conceivable change of climate in her passage or that of the solar system through space, to any extent satisfy him. He seems to be taken for a while with the supposition of Mr. Mackay of Norwich, put forth in 1827, that the precession of the equinoxes is not circular but spiral, the poles shifting their position four degrees at each revolution of the equinoxes, every such revolution taking up 25,000 years, and a cycle of 2,200,000 years bringing about a complete rotation of the poles. Indian and Egyptian lore has been brought in to fortify this opinion. In some 200,000 years, it results, the poles of the earth and of the ecliptic will be one, universal spring prevailing over the earth. At other periods either pole would in turn be presented to the sun. In some respects similar is the theory of Colonel Drayson, who, however, adopting a different rate of angular change, obtains a precessional cycle of 31,840 years, at the half of which period the poles would be brought into such a position as to induce a glacial temperature in winter, with a tropical one in summer in all places within 54° 34' of latitude north or south. But neither theory will hold good for a moment, the vast secular duration of alternate heat and cold being altogether beyond a mere annual variation, which would do no more than make summer extra hot and winter extra cold. A different and more abiding alteration must be sought for in the relation of the earth's surface to the sun. And this consists, Mr. Strange believes, in the earth's constantly altering its position with respect to its own poles. "Either the mass of the earth is always, though slowly, moving away from its poles, or the polar axis is slowly altering its position across the earth." What, he asks, constitutes the rotating axis of the earth, or what is the power which makes the earth rotate upon its axis? From the observations of Faraday and others it may be deduced, and beyond doubt with much reason, that this rotating force is the magnetizing power directed by the sun upon the earth. There is not much in Mr. Strange's illustration from the magnetism observed in iron ships, in which he would fain see but the action of solar magnetism, passing over the molecular changes induced by hammering combined with the polarity of the ship's position during construction. A correspondent has, however, made good the rotation of a ball of wood in water by means of a magnet, and Professor Tyndall's experiments in diamagnetism point the same way. Now conceive the sun, the great magnetizer, to change its axis, besides rotating on itself as it does in some twenty-five days. Would not the magnetic current emanating from it affect correspondingly the axial rotation of the earth? The secular variations in the declination and dip of the needle—the former reducible to about 320 years—indicate variations of the solar magnetic force, and encourage the belief that such a change may affect the axial position of the earth, bringing all places in succession under those climatic changes which we have to account for. Four transitions of climate would, Mr. Strange argues, be brought about in the course of each entire revolution. Each part being twice in a line with the poles, north and south, and twice intermediately in a line with the equator, would be subject in rotation to two glacial and two torrid epochs; and these changes closely correspond, he insists, with those exhibited by the quaternary and tertiary strata. Now a sphere like the earth must of necessity rotate round its shortest axis, which is in the case of the earth about 26½ miles less than its equatorial diameter. If then the earth shifts its axis in relation

to the sun, the form of the earth must yield to adapt itself to this new position, with the inevitable result of a tremendous racking and straining of the strata, upheaving chains of mountains like the Andes, and causing corresponding faults and fissures elsewhere. The existing poles must, Mr. Strange is not afraid to say, have gone over during the tertiary period, and within the range of human life, no less than 480 degrees, extending to a range of 2,880,000 years, which he finds to a great extent borne out by "ancient Aryan" and Egyptian traditions. It was the terrific stretching and cracking of the rigid crust during these tiltings or rockings of the earth, as the former pole turned by degrees towards the sun, and bulged under the novel centrifugal expansion, which brought down the limestone masses about the ears of the terrified prehistoric inmates of Kent's Cavern. Of those blocks of stone Mr. Strange makes a great point. From what cause they could have fallen seems to have strangely puzzled the geologists to whom he refers. Still the fact that stratified masses, percolated by water, should occasionally come down by the force of gravity, need scarcely be thought so remarkable a portent that the great globe itself is to be turned top-sy-turvy to account for it. Moreover, must not the same shocks have brought down whole mountains upon the heads of the unhappy cave men as they ran out? It is difficult to conceive anything lofty not being brought low during these reiterated concussions, leaving at least more widespread and conclusive proofs than those of the Devonshire cavern.

We have not space to go just now into anything like the full consequences involved in these tremendous oscillations of the earth. But what are we to suppose the water to have been about, whilst the once polar level was being raised six-and-twenty miles, and the former equatorial zone proportionately flattened in? What must have been the relative superficial changes of land and water, the sea of course keeping its usual level, in relation to the general spheroidal mass and to the new axis? No geologists have disputed the fact that the ruling geographical features of the globe have undergone no material change during the human epoch, in the course of which those gigantic local movements are supposed to have occurred. Mr. Strange himself anticipates objections on the score that "the geographical changes they involve have not been observed to occur." But of this he thinks no more than of the fact that no astronomer can be got to lend the slightest countenance to any such violent tampering with the poles. "The value of this objection depends upon whether the condition of scientific knowledge is such that we may conclude what astronomers have not detected does not exist." Not three hundred years have elapsed since every astronomer denounced Galileo, and what unexpected truths have within that time been brought to light! "The fall of an apple exposed the law of gravitation"—Mr. Strange's way of putting a mythical anecdote—and why should not a new astronomical movement be brought to light, or, as he would prefer to say, be "eliminated," in addition to the diurnal and the annual movements which have done duty so far?

Referring in his postscript to Professor Geikie's *Ice Age*, the ample and carefully compiled facts of which he finds in a great measure handy to his purpose, Mr. Strange is impatient with that able physicist for not following out his speculations upon the causes of these phenomena in the direction or to the extent of his own bold hypothesis. The variations in axial inclination and orbital ellipticity which contented the Professor and Mr. Croll are far from coming up to the requirements of a theory which provides Britain with a climate "at one time icy like that of Greenland, at another torrid as that of India or Central Africa." We pass by this ultra statement of the facts of the case, resting, as it mainly does, upon the finding near Leeds of the remains of a hippopotamus, which might well have floated down stream hundreds of miles from the scene of his gambols in the tropics. Of Mr. Strange's logical use of the evidence as it is we may judge from his seeing in a remark of Professor Geikie's, that mere proximity to the sun will not necessarily produce a warm season, a reason for believing that the effect of distance from the sun is to induce heat, and of propinquity to induce cold, and this by way of accounting for our having snow and ice continuously at all seasons of the year on the Himalaya and the Andes, not the slightest heed being given by him to the effect of diminished radiation from the earth's surface. Perhaps if he took sufficiently into account the facts of the case as they actually exist, he might feel little need for any addition to the movements already recognised by science, certainly none for the violent revolution which he has himself seen fit to hazard. With the existing ice-sheet coming down in Greenland to a latitude all but that of northern Scotland, and with the grandest glaciers of the globe enveloping the Himalayas all but within the tropics, is it not permissible to believe that some further modification of the existing limits of land and water, as the result of local changes of level, followed by different sets of oceanic and aerial currents, would go far towards meeting the requirements which these secular alternations of climate force upon science? On this aspect of the problem we have written before, but there is another view of it which we have never seen before, and which we confess strikes us as a poser. In the crowning argument of his book Mr. Strange carries us beyond the finite range of time and sense into the eternal fitness of things. A kind of cosonical equity takes the place of physical law. "The sun being the great supporter and regenerator of the terrestrial system, it is a fitness of arrangement which may present every portion of the globe to receive in turn his genial influences." Things are most unfairly managed now. "One place is habitually buried under ice and another scorched up in un-

bearable drought." Turn and turn about is the rule in the amended cosmogony which Mr. Strange has to reveal. All parts of this earth have been, or are to be, in turn Arctic, Temperate, and Tropical. Mr. Strange starts with a great impatience of what he calls "cosmic representations" and "epasmodic efforts" in the old-fashioned notions of creation. He must pardon us if we show ourselves a little impatient of the tremendous drama which he calls upon us to admit and to admire in their stead.

A PATRICIAN OF VENICE.*

THE political and social institutions of the Venetian Republic, at the time of its highest apparent prosperity, are minutely described by M. Yriarte in this memoir of a Venetian nobleman, who filled many public offices during the latter half of the sixteenth century. Marco Antonio Barbaro, though a person of second-rate historical importance, is an excellent representative of the able and patriotic men, born and trained to the work of civil administration, to whose care for many generations the welfare of Venice and her colonies or conquered provinces was safely entrusted. His labours as a diplomatist, too, both at the French Court under the rule of the Guises and of Catherine de' Medici, and in the negotiations with the Sultan for a definitive peace after the destruction of the Turkish fleet at Lepanto, connect this active patrician with the general affairs of Europe. For our own part, indeed, we should have preferred a biography of his elder brother, the versatile and accomplished scholar Daniel Barbaro, who came as ambassador to England in the reign of Edward VI., and afterwards, having become a Churchman, was summoned as patriarch of Aquileja to attend the Council of Trent. But the life and times of Marco Antonio serve equally well as a framework for illustrative notices of Venetian and Continental history.

The nobles of Venice and their sons, from the age of twenty-five, numbering above twelve hundred persons, were expected, and even compelled, to sacrifice much of their private leisure to the service of their country. It is one of the indirect benefits of Parliamentary government, before it declines to a democratic basis, that the heirs of wealth and social influence are preserved, in some degree, from the demoralizing habits of the idle man of pleasure. All Venetians of rank were summoned by sound of bell every Sunday, saint's day, or holiday in the year, at eight in the morning in summer, and at noon in the winter, to attend the Great Council, which sat during four hours. This *Maggior Consiglio* was the permanent constituent and legislative assembly. It further delegated 20 of its elder members to the Senate, which comprised also, *ex officio*, the Councillors of State and Ministers, the Council of Ten, the chiefs of departments, the governors of some provinces, as well as ambassadors, when not absent on duty, and the forty judges. The Senate met every Wednesday and Saturday. It appears that the actual attendance in the Great Council averaged five or six hundred, and in the Senate about one hundred and eighty. The functions of the Great Council were to elect nearly all the magistrates, ministers, and councillors, from the Doge appointed for life down to the local prefects, and to pass the laws proposed by the Ministry or College of Government, or to decide questions referred to it by the Senate. Elections were here conducted by the nomination for each vacant post of four candidates, whose merits had been repeatedly compared in several ballotings of a large committee; having an inner sub-committee for the previous task of first selection. One of the four nominated candidates was afterwards to be chosen by the votes of the whole Great Council. The full College of Government, or Executive Ministry, consisted of the Doge with his six Councillors of State, who formed the inner Cabinet; the six *Savii Grandi*, who had free access to the Doge's Privy Council for the purpose of advising him, and of proposing measures to lay before the Senate or the Assembly; also three chiefs of the Quarantin or judiciary; three of the *Avvocati del Comune*, a sort of heralds' and lawyers' College, by which the pedigrees and privileges of nobility were guarded; the two *Provveditori*, or Commissioners, who took care respectively of the harbours and canals, and of the naval arsenal; the five *Savii di Terra Ferma*, who directed all military establishments on land; and five young Assistant-Ministers, called *Savii alli Ordini*. This College of Government met every day, and the Doge had a separate conference daily with the Cabinet Ministers and the *Savii Grandi*. He was not allowed, indeed, to perform the most ordinary act of government, to see an ambassador, or to write a letter of business, except in the presence of several Councillors. By the intervention especially of the *Savii Grandi*, the Senate, which disposed of all political affairs at its discretion, exercised a constant control over the daily business of administration, the minutes or reports of which were presented weekly. Every official despatch or instruction was, as a matter of course, submitted without delay to the approval of this vigilant and industrious deliberative body. It was by the employment of a large staff of secretaries, or rather editors, to analyse and to digest the mass of records and correspondence, that the Senate was enabled to get through its work.

A limited number of young nobles, chosen by drawing lots on a fixed day, were allowed to begin their political career, but without a legislative vote, at the age of twenty instead of twenty-five. Marco Antonio Barbaro in 1538 was one of these. He had already

* *La Vie d'un Patricien de Venise au seizième siècle*. Par Charles Yriarte. Paris: E. Plon et Cie.

been an unofficial attaché to the embassy of one of the Giustiniani at the Court of Francis I. Marrying, after three or four years, a daughter of Marco Antonio Giustiniani, he devoted himself with modest patience, during twenty years, to the ordinary public duties of his station. He sat in the Great Council, and served as an Assistant-Minister. In 1559 he became a senator, and in the next year obtained the appointment of a Savio di Terra Ferma, one of the heads of the Executive Administration. During thirty-five remaining years of his long and useful life, Marco Antonio Barbaro was constantly in office, either as Minister, Cabinet Councillor, Savio Grande, Ambassador, or special Chief Commissioner, Procuratore or Provveditore. His occupations were varied, having to deal with the finances, foreign diplomacy, the University of Padua, the navy, arsenal and dockyards, the rebuilding of the Rialto bridge, the frontier fortresses of Friuli, and the regulation of prerogatives at the election of a new Doge. He was for three years in France as ambassador, and nearly six years at Constantinople, where he was detained as a prisoner during the war from 1570 to 1573. He was sent also to Rome in 1585, on a formal mission to compliment the new Pope, Sixtus V. Amidst these diverse public engagements Barbaro found leisure to cultivate a taste for art, like other Italians of rank in the age following the Renaissance. He did not, indeed, equal his brother Daniel, who designed the fresco-painted ceilings of two grand halls in the Doge's Palace, that of the Pregadi or Senate, and that of the Council of Ten. But the two brothers jointly erected and adorned, with the aid of Palladio, Vittoria, and Paul Veronese, the most renowned architect, sculptor, and painter of their day, a rural mansion displaying many artistic beauties. The Villa Barbaro, at Maserà, on the hills near Asolo, north of Venice, is recommended by M. Yriarte to the attention of tourists who have some knowledge of the Italian mind as well as of the conventionalities of art. Marco Antonio Barbaro with his own hand modelled the figures of Diana and Actæon, of Triton and Amphitrite, in front of a grotto which was here built for his repose.

The Turkish war, in which Venice, with the States of Central Italy, obtained the brief but powerful co-operation of Spain, is the most important historical transaction of Barbaro's life. His diplomatic errand in France, between 1561 and 1564, was that of a spectator and reporter watching the conflict of parties. The civil war, then recently begun, was carried on in those years with some vigour by Condé and the Huguenots against the ruling courtiers and ecclesiastics, with whom Venice was on friendly terms. The deaths of the King of Navarre and the Duke of Guise were incidents of this conflict which Barbaro had to announce with strong expressions of condolence. It was the traditional policy of Venice to profess great zeal for the Catholic Church in foreign States, while firmly resisting every attempted encroachment of Papal or clerical authority within its own dominions. Members of the Senate who chanced to have any connexions in that quarter were frequently expelled with the cry of "Fuora i Papalisti!" The clergy were uniformly excluded from every Government office; but the taxation of their estates for the service of the Republic was a measure to which the Pope's assent was regularly sought. The astute politicians of Venice were fully aware of the use that might be made of Church influences and sanctions in aid of their secular designs. They looked on with keen interest at the opening of the Council of Trent, which found its able historian in Fra Paolo Sarpi, the Venetian advocate of Broad Church interests. At a later period they were met by Sixtus V. in a spirit of amicable compromise, and some points of disputed jurisdiction were arranged to their satisfaction. But the Pope's displeasure was again excited by the readiness of Venice to set the example of recognizing Henry IV. as King of France. This took place, however, shortly after the death of Marco Antonio Barbaro, who could not have guessed at such a result when he witnessed, thirty years before, the beginning of the long religious wars.

In the great struggle between the commercial Commonwealth and the Mussulman Power in the Levant, it was the fortune of our Patrician to perform a serviceable, though not glorious, part. The Embassy at Constantinople was a highly lucrative appointment, from the large amount of fees payable on Venetian trade with Turkey. No one could expect, as a rule, to enjoy this profitable foreign mission above two years. Messer Barbaro was therefore a lucky man to be imprisoned by Sultan Selim II., after a sojourn of a year and a half, and confined, but not very severely, till the conclusion of peace three years later, when he was obliged to stay another year for the introduction of his successor. He received from the Council of State and Senate their emphatic thanks for his punctual obedience to all their commands. It seems, however, to the reader of this narrative, with no preconceived notion of Barbaro as a surpassing genius in statesmanship, that his ability was proved chiefly in managing to send constant and precise information to Venice of all that the Turks were doing. A host of spies and messengers were kept in his pay; the Jews and the renegades were particularly useful. He sedulously endeavoured, at the outset, to make things smooth and pleasant by all manner of private friendly offices, gifts of a complimentary kind, or secret money bribes, to the Sultan's Ministers and harem, and to the household servants at the Porte. Even by these means, however, he was not able to prevent the war. It was undertaken by Turkey for the reconquest of Cyprus, quite as much as for the suppression of piracy, then practised by the

Uscoques with impunity from the Gulf of Quarnero. The Turks, on their side, were equally offenders against Italy and Spain, permitting corsairs from every port of Northern Africa, Western Asia, and the Greek Isles, to prey upon the argosies of Christian merchants, and to make frequent attacks on the Venetian outposts along the Eastern Adriatic coast. But Cyprus, for which Venice already paid tribute to the Sultan, and the Ionian Islands, which were held on the same condition, were the main objects of Turkish desire. The Morea and Albania, formerly provinces of the Venetian Empire, had fallen a century before this time under the power of the Crescent. The final contest was now to be fought out, in spite of the pacific disposition of the trading Republic, and the complaisance of its circumspect agent at the Porte. The Sultan demanded the absolute surrender of Cyprus, because, he said, it was the rendezvous of pirates from the Adriatic who ravaged the Turkish shores. The war began in June 1570, with the invasion of that island; the town of Nicotia was captured in September, and 20,000 of its garrison and people were slain. Venice, upon this occasion, made a desperate effort to defend her old position in the Levant. A fleet and an army were equipped, which were reinforced by a few galleys and troops belonging to the Pope, to the Grand Duchy of Florence, the Duchy of Ferrara, the Republic of Genoa, and the Knights of Malta. But the most effective ally was King Philip II. of Spain, who engaged to pay half the cost of the war, and sent his own fleet and army, under his young half-brother Don John of Austria, to aid the Italian forces. It was not till the autumn of 1571 that they were all collected and in motion, before which time Famagosta, the last fortress held by the Venetians in Cyprus, was captured after a twelve-month's siege, and its heroic commander, Bragadino, was savagely flayed alive. In the great battle of Lepanto, on the 7th of October, the allied navies of Spain and Italy gained a splendid triumph. We cannot refuse our sympathy in reading of the popular exultation at Venice upon the news of this victory; but its effect on the political destinies of the Mediterranean was remarkably slight. The Turkish fleet was reconstructed so rapidly that it would next year have destroyed every remnant of Venetian sovereignty in the Archipelago but for the continued aid of Spain. When the dilatory and evasive proceedings of 1572 showed that this aid could no longer be relied upon, it became impossible for the Republic, oppressed by the losses it had incurred by the stoppage of its trade, and by the devastation of its eastern provinces, to carry on the war. Barbaro was therefore instructed, with the strictest privacy, unknown to the other allied Governments, to negotiate for Venice a separate peace, by which Cyprus was given up to the Sultan, in addition to the payment by Venice of a large pecuniary indemnity, and the augmentation of yearly tributes due to the Porte. "One would have inferred," says Montesquieu, "from these terms, that it was the Turks who had won the battle of Lepanto." The treaty of March 1573 was indeed a "lame and impotent conclusion," but if it was a "calm, dishonourable, vile submission," the blame should not fall upon the Ambassador at Constantinople. He seems, however, to have been anxious for peace, as he described the power of the Turkish Empire, in a memorial which he read to the Senate after his return home, with a manifest apprehension of its dangerous extent. The Senate and Great Council, after determining to accept peace at any price, found it expedient to make a show of being highly gratified with this result. More than usual honorary recompense was therefore awarded to Barbaro, who was now appointed Procurator of St. Mark, the second official rank in the State.

The later chapters of M. Yriarte's book supply ample details of the administrative work in which this diligent Patrician was employed during the remaining years of his life. We learn all about the constitution of the University of Padua, which was thrice placed under his direction, and which had a hundred professors, with a thousand students of the noblest families, devoting themselves to jurisprudence, to civil and canon law, to theology and philosophy, to mathematics, to what was then taken for chemistry, botany, anatomy, and physiology, with the best lights they could procure. Among the professors of this University in the sixteenth century were such men of European fame as Fabricius, Vesalius, and Fallopius, the anatomists; Paolo Sarpi, the ecclesiastical lawyer and historian; Panciroli, the juriconsult; and, finally, Galileo, who was appointed in 1594, and whose salary was doubled in 1609 as a reward for his invention of the telescope. Another topic of some interest related in connexion with Messer Barbaro's manifold public services is the management of the Venetian arsenal and dockyard, which at the date of the battle of Lepanto employed 16,000 workmen, and was famous for the perfection of its shipbuilding and its cannon foundry. This is a subject that should have especial interest for some English readers; and it is worth while to observe that parties of the ordinary townspeople, chosen by lot, were obliged to attend a weekly school of gunnery practice, with yearly competitions, as at Wimbledon and Shoeburyness, for prizes given to the best marksmen. There is much in these authentic passages of Venetian history to help one to a better understanding of the Court fashions of the Elizabethan period in England, and of those plays of Shakspeare which deal with romantic stories of Italian life.

DE VERE'S ALEXANDER THE GREAT.*

MR. DE VERE has taken a great man for the central figure of his poem, and, in doing justice to his greatness, does not forget the realities of flesh and blood. As Mr Carlyle has said, "a man's religion is the chief fact concerning him," and the relations of Alexander with the Unknown Power necessarily entered into the brief and pregnant tragedy of his life. This is the point of view from which Mr. De Vere has treated the subject. In this portrait of a hero of whom so much, and yet so little, is known, the imagination is free to appreciate in its most tragic expression that shock of free will and destiny from which the sparks of religious faith are struck out. The Empire which held in solution the ancient kingdoms and races of the East from Egypt to Lahore is a fitting stage for the "strong King" of prophecy. Dramatic unity is given to the long procession of nations and creeds in this play by the incident of Alexander's visit to Jerusalem. Whether or not Josephus is to be trusted on this point, Mr. De Vere has made effective use of it; but the poet is not unsupported by an historian as little credulous as Bishop Thirlwall, who compares the meeting of Alexander and the Jewish clergy to that of Attila and Leo, and who deems the story to be well founded, notwithstanding the silence of the Greeks. The action of Jehovah in the king's doom is the key to the drama. The failure of Alexander would remain a remote historic fact, the ten years of conquest covered by the play would be unmanageable in a tragic sense, but for the spiritual crime with which the end is connected. The hero is represented as complete in all human perfection and free from the lower vices:—

All the buried ages
Summ'd their old wealth to enrich, for man's behoof,
With virtuous wisdom one Olympian mind,
Which, grappling all things—needing not experience—
Yet scorn'd no diligence.

His failure comes of disobedience to the heavenly vision and to the prophecy revealed to him at Jerusalem. The deterioration of his conscience and his spiritual decline, as conquest follows conquest, are shown in the less noble expediency which governs his purpose when he has once denied acknowledged truth as inconvenient to empire. Yet he is always great. The mean and shallow traitors who fulfil his doom are so indescribably inferior to him that the Divine hand is almost visible as it strikes through them. He is a head and shoulders above all other men. Utilitarian on an Imperial scale and with Imperial power, and worshipping without restraint an ideal humanity of the noblest type, the pupil of Aristotle confronts and grasps the ancient religions on his path. He accepts them only as they subserve his empire and conduce to the beneficent rule he desires. He would be a God-like providence furthering all labour and aspiration of mankind. Yet, as his general Ptolemy mused while waiting for the King at the Temple-gate of Jerusalem,

On something deeper in us than self-love
Who'd lift mankind must build.

It was to this "something deeper" that Alexander had refused homage. Religion had henceforward for the King no meaning till the end had come upon him at Babylon, and Hebrew captives singing the songs of Zion brought to his bewildered soul some airs from heaven. At the moment of his highest fortune, and while appealing to the superstition of men and to his own by decreeing to himself divine honours, he reveals the weakness brood of his spiritual crime when he confesses lapse from his earlier hope:—

This only know we—
We walk upon a world not knowable,
Save in those things which knowledge least deserve,
Yet capable not less, of task heroic.
My trust is in my work; on that I fling me,
Trampling all questionings down.
I sometimes think
That I am less a person than a power,
Some engine in the right hand of the gods,
Some fateful wheel that, round in darkness rolling,
Knows this—its work, but not that work's far scope.
Hephestion, what is life? My life, since boyhood,
Hath been an agony of means to ends."

There are love-scenes tenderly touched, but quite subservient to the main current of the tragedy. There is a plot, but, as we know the inevitable end, it does not distract attention from the central interest of what is rather a tragic masque than a play in the ordinary sense. The scene changes from Troy to the Caspian shore, and from the Jaxartes to the Indus, but we hardly notice the stage directions. Fortunately we are not distracted by tricks of local colour or by the realism which, while careful of costume and climate, neglects the springs of thought and feeling. No revelations of Mr. De Vere's particular crotchets disturb us, though, as is quite credible, the keen-witted Greeks guess at truth much as men guess now. The Persian creed, nobly drawn, has interest for modern worshippers of Heat and Force. The pantheistic pride of India finds expression in Calanus, the Brahmin of the drama. Mr. De Vere secures by breadth of painting the sympathies of the nineteenth century for his classical personages; and Ptolemy and other characters are foils to the great King whose genius

stood
On the mountain-tops breathing the breath of Gods.

* *Alexander the Great: a Dramatic Poem.* By Aubrey De Vere. London: Henry S. King & Co. 1874.

but who "measured all things by the needs of Empire" only. Rapidly the pride grows in him that saps friendship and judgment. Though the despicable cynic Phylax strikes at him through his friend, and severs the one tie by which Alexander was bound to wholesome earth, it is contempt for the conditions of humanity, and a grief excessive in its arrogant self-love, which bring him to his death-bed at Babylon. He is struck down in the re-establishment of the city which has so long symbolized the lower world that the poet may well use the omen.

While he invests the subject with religious awe Mr. De Vere does not sacrifice action to reflection. In the artistic combination of his materials he has probably found the tradition of Alexander's friendship for Hephestion (*sic*) somewhat unmanageable; but by establishing in an opening scene the parallel between Hephestion and Patroclus, the tie gains at once its poetic uses, and plays a part in the love-scenes and in the household life where Alexander has obviously no place. But, if the plot is hardly a plot, the poem is full of dramatic contrast. Thus the speech of Ptolemy acknowledging man's incapacity so to dissociate evil from good as to build stable empire precedes the interview of Alexander with the Jewish high-priest, when the King rejects the revelation of the limit of his power. When pride has wrought in him the madness which confuses the divine and human, Calanus the Brahmin presently touches the extremity of a yet greater arrogance, and in suicide "rejoins the infinite." There immediately follows the charming scene of reverent and self-forgetting love, where Arsinoe and Hephestion strengthen one another to self-sacrifice for noble ends. The daughter of Darius, anticipating the troubles of her marriage with Alexander, which for a political reason has been decreed, says:—

Feel them I may;
I know not if I ever feared; I think
I never shall. Fear not for me, Hephestion;
Not wholly sorrows were the sorrows past;
Those that must come will not be wholly sorrows.
Oh, there's a sweetness spread o'er all the earth
The trampling foot makes sweeter. . . .
Life is peace
To those who live for duty. Peace more pure
Will find us after death.

HEPHESTION.

The moon is risen:
I see it not, but see you in its light,
Like some young warrior, silver-mailed and chaste;
Or liker yet to her, my childhood's wonder,
Great Artemis, as I saw her statue first
Against the broad, full moon, while snows high heaped
Ridged her dark wintry porch. Farewell, Arsinoe!
There was a mist that brooded on my spirit;
That mist is raised. To you no ill can come
That virtue will not change to its own essence.

When soon afterwards Hephestion dies, poisoned by the cynic leech Phylax, the end draws visibly near, for grief drives the King to ever more frenzied restlessness. During his brief household peace at Ecbatana, in "diligent musings" he resolves to see once more the high-priest of Jerusalem:—

But in the gloomy raptures of just wrath
That mood went by.

The "unobsequious Fates" are at his heels. As he listens to the Psalm of the Hebrew captives working in the Babylonian marshes he is fever-stricken, and there only remain for him half-delirious dreams and recognition too late:—

'Twas not the mists from that morass disastrous,
Nor death of him that died, nor adverse Gods,
Nor the Fates themselves; 'twas something mightier yet,
And secret in the great night, that slew me.

After a scene in which Arsinoe's pathetic trust that the Lord of Light is not the less the Lord of Love—

A love that out of love created all things;
A love that warring ever willet peace;
A patient love from ill educing good;
A conquering love triumphant over death—

relieves the gloom, there remains but the King's death to follow. His last words recall the opening scene at Troy, when the "deed unborn" was offered to Achilles by his heir; and they give the measure of his friendship, which was a doom rather than a spontaneous sympathy.

It is impossible within our limits to do more than direct the reader's attention to the dramatic use of landscape in many passages. Nature subserves the delineation of character throughout, but with reticence worthy of the theme. No fantasies of style or mannerisms interfere with the plain purpose of Mr. De Vere's work, and common sense balances its imaginative power. A slight archaism of style lends illusion; but the poet is not afraid of those modern phrases which link the subject of his drama with modern thought. Of course faults could be found in the occasionally rugged rhythm, and here and there a line might be relieved from over-weight of meaning; but in a work like this we are not careful to note trifling imperfections.

RULING THE ROAST.*

WE have before now had occasion to remonstrate against the ridiculous fashion which authors, and especially lady authors, follow in the naming of their books. It is no longer considered necessary that there should be any connexion between a novel and its title. They are things apart from each other. When the novel is written a name is bestowed upon it, not in order to indicate its contents, but to call attention to the fact that the novel exists. In many cases it would be quite as well if this fact were suppressed. As the object of the title is to attract curiosity, it is natural that the author should strive to make this as unusual as is possible. As there are many novels, and for every one an author who desires to direct the public eye to his production, a kind of race for oddness may be observed to take place in the advertisement columns of the newspapers. Fragments of Scriptural texts, lines from Shakspeare or from popular poets of the day, proverbs, alliterations are all pressed into the service of the hurrying crowd of novelists. The effect is not pleasant. We do not wish to deny that the finding of an attractive title to a book is a laudable object; but the book and its title should have some kind of reference to each other. Even the catchpenny advertisements of drugs and hair-washes from which the present fashion of naming novels would seem to be borrowed generally serve to point out the nature of the article whose merits they proclaim. In the case of works of fiction this is considered superfluous. It is true that there does exist this rule, that an extravagant title heralds an extravagant book, just as the clanging of a gong at a fair betokens the exhibition of an exciting spectacle, a melodrama, a monster, or a wild-beast show. Only there is generally some amusement or excitement to be got out of the fair; there is very often none to be got out of the novel.

It must be admitted that Lady Wood's novel bears a more appropriate device upon its covers than do many of its compeers, inasmuch as it contains several passages concerning cooking. On the other hand, the inscription on the outside of the volumes is at variance with their inside, in that the events there described turn mainly upon the fact that the principal characters have no roast to rule. Possibly, however, the title may have an esoteric meaning connected with the present fashion of schools and colleges for women, and may be intended to point the moral that the heroine, who is an excellent Greek and Latin scholar, would have been better employed in attending the lectures on cookery at South Kensington than in the study of dead languages. It is not her fault, however, that she is so well-read, as she is the daughter of a country clergyman who takes pupils, and whose chief delight it has been to instruct his daughter in Latin and Greek. Subsequently she employs great part of her time in coaching her father's pupils when they get into difficulties over a knotty passage. Having been informed how excellent a scholar this young woman, Myra Leith by name, has become, the reader is a little surprised to find in one of the early pages of the book that she thinks the Greek words *οὐδὲν ἴσαρ* represent the English "None is equal to you." However, as a rule, her scholarship is correct enough. It is true that she ensures accuracy by confining herself to quotation.

She is introduced to the reader in the act of helping Peath Sandridge (the love of odd names seems to have penetrated from the outside to the inside of the book), son of the Earl of Arras, and a pupil of Dr. Leith's, over his difficulties with the Greek Testament. Peath Sandridge is, after his cold-blooded fashion, in love with her; so is Sandal Tyne, a former pupil of her father's, whose wild ways serve to show in high relief the extreme propriety of Sandridge's demeanour. It is evident that Myra very much prefers the former pupil to the present one, and in this preference the reader is apparently expected to sympathize. It is difficult to do this after reading of the extreme rudeness of his conversation, and becoming acquainted with the poems which his love inspires him to address to Myra. One of these is distinguished by a large-minded disregard of rhyme and rhythm. The other has for its theme the image in the poet's mind of Myra at her prayers, and is chiefly remarkable for a line devoted to the beauties of her night-gown. Sandal Tyne, instead of making a proposal to Myra in an ordinary fashion, chooses to adopt the plan, which is perhaps romantic, and is certainly unpractical, of writing a proposal and placing it between the leaves of a dictionary in her father's study. Not unnaturally by the time it is discovered Myra, imagining that Sandal has disappeared for ever, has accepted Peath Sandridge. This event has been hastened by a burglary attempted at Dr. Leith's house, in resisting which he receives injuries so dangerous that he is anxious to make certain of his daughter's possessing a home in the future. After Peath's proposal has been made and favourably received, Myra finds Sandal Tyne's artfully concealed communication, and goes to her room "to read and re-read the love-letter and verses, and then weeping to bury her face in the pillow and sob, 'Tis too late! too late!'" Not one of the characters in Lady Wood's novel ever condescends to say "it is," or "it was," or "it will." It is always, whether on the most exciting or the most trivial occasions, 'tis, 'twas, and 'twill.

The marriage ceremony gives the writer of *Ruling the Roast* an opportunity of taking one of the most remarkable flights out of all ordinary rules of grammar which in all our experience of novel-grammar we remember. The bride's costume and appear-

ance are described in a commonplace method. Then follows this extraordinary picture of the bridegroom:—

Peath looked every inch a gentleman, though rather too tall and spare looking, narrow-shouldered, and hooked nose.

After the marriage the "hooked-nose" Peath and his wife go to stay with the Earl of Arras. Peath is somewhat nervous as to the effect which his unsophisticated bride may produce upon his proud and eminently correct relations; and for this nervousness it will be seen that he had good reason. The reader has been led to regard Myra as a kind of artless maiden whose education has been unfortunately and unavoidably neglected save in the matter of Greek and Latin. He is induced to believe her a girl who, if ignorant of the polished luxury of society, is well acquainted with the decencies of life; who, if her manners are somewhat brusque, yet possesses what is called an innate refinement. How far this belief is well founded may be judged from some account of her conversation and behaviour at dinner (the italics are the author's):—

It would have puzzled a cleverer person than Lady Induivre to find a subject of conversation with a young person so incuriously placed.

"I dare say she knows nothing—very young and ignorant, doubtless."

"Do you like Périgord pie?" she asked Myra at length, as one was placed on the table.

"I do not know; I never ate any."

"Pray allow me to put some on your plate," said her brother-in-law.

He watched her as she tasted it.

"I know how to make most pies," said the frank young bride. "Rump-steak, pigeon, partridge—*stunners*. Oh, shouldn't I catch it from the Doctor for saying that! Slang, you know," she said, nodding familiarly at her sister-in-law.

"I imagine, then," said Lord Lyrate, "that your worthy father, Doctor Leith, did not instruct you in this modern phraseology. May I ask how you acquired it?"

"By running about over the vicarage, first with one pupil and then with another. Such fun it was."

A dead silence fell on the company at this revelation.

The butler filled Myra's glass with sparkling Moselle. She drank it down at once, observing it was very nice *fin*, quite as nice as *ginger pop*.

Myra, quite unconscious of the chills she had shed over the company, proceeded to give her opinion of what she had just consumed from her plate.

"It is very nice, but what it is made of passes my conjecture."

"It is made of the livers of geese," said Lord Lyrate. "They are nailed close to a hot fire, to enlarge their livers, and then, when the geese are sufficiently diseased, they are made into pies, and we eat them."

Myra's face flushed, and her eyes sparkled with anger; but presently she smiled and said—

"Ah, Lord Lyrate, you are boxing me, just as the pupils used. Such cruel things cannot be done, or if they were, we English folks would never be so wicked as to buy them."

"I believe," stammered his Lordship, "that it is perfectly true."

"And you eat such food, and enjoy that which has caused such prolonged suffering? Ah! I shall never forget it, though I ate it unknowingly. It makes me sick to think of it," said the plain-spoken young lady.

It is not surprising that such a description as Lord Lyrate's should turn his hearer sick. Lord Lyrate is not more remarkable in his ways and manners than are the rest of the Sandridge family. He causes Myra great mortification by exposing her ignorance of French, but she has her revenge when a new picture of Lord Arras's is opened. Here is the description given of it by the writer, in which the confusion of tenses may be noted:—

The scene represented a wild sea-coast, and lying on the sands was the figure of a youth, whose beauty was dimmed by coming death. A few terrified attendants are lifting his head, and disembarassing him from the wreck of his chariot. In the far distance, rushing towards the mountains, were his steeds, pursued by a monstrous creature, in the form of a bull, breathing fire from his nostrils.

Every one is at a loss to know what the subject of the picture can be, until Myra discloses that she knows where to find it, and takes from the library shelves a copy of Euripides's *Hippolytus*, which neither the Earl nor his son is able to construe:—"Tis some years since I was a prefect of Winchester commoners, Mrs. Peath," says Lord Lyrate; "my Greek is somewhat rusty." "Like my French, eh?" she replies. It is in the first place improbable that a man who had been high up in a public school should lose all knowledge of Greek in a few years. In the second place, a man who can quote French so fluently as Lord Lyrate does is more than likely to be acquainted with the scene in Racine's *Phædra*, which is a tolerably close copy of that in Euripides which Myra translates for the benefit of her father and brother-in-law. Myra's knowledge of Greek, however, stands her in yet better stead than this, for by quietly prompting a bishop in the middle of a quotation from Plato she arouses his interest in herself and recalls her father to the memory of the prelate, who presently bestows a good living upon him. The gift is well timed, for, on the return of Myra and Peath to their modest living, the hitherto weak and submissive Peath launches with unconquerable obstinacy into a course of wild extravagance. A great part of the book is taken up with a minute account of the domestic misery and squalor resulting from this, which is singularly unpleasant. In a novel of the calibre of Lady Wood's production one looks for amusement, and this, it must be said, is to be found in many parts of *Ruling the Roast*, although it is often unconsciously provided. The thought, perception, and power of a first-rate writer are required to deal with the more serious aspects of life. And it would be difficult to find anything more serious and more out of place in an ephemeral novel than the spectacle of a clergyman gradually reduced to poverty by his own extravagance, until from borrowing money and never repaying it he descends to embezzling the Sacrament money. Few things tell more heavily against a writer than the inappropriate introduction and inadequate treatment of a tragical situation.

Such interest as there is in *Ruling the Roast* is divided between

* *Ruling the Roast*. A Novel. By Lady Wood, Author of "Sabina," "On Credit," "Wild Weather," &c. 3 vols. London: Chapman & Hall, 1874.

the fortunes of the Sandrighes and of Sandal Tyne, the former lover of Myra. There are some ideas originally good in the working of the plot, but they are used in so robbing and inconsecutive a manner that all their goodness evaporates. The different parts of the story do not hang together in any way. We have called attention to some offences against good grammar in *Riding the Roast*; it is unpleasant to add that there are some quite as bad, and of a kind far too common in novels nowadays, against good taste.

AMERICAN LITERATURE.

THE fame of General Lee has so completely overshadowed that of all the other military chiefs of the Confederacy that probably few of the European public now remember that there was a commander of the army charged with the protection of the Southern capital before the great soldier who has linked his name in undying glory with the defence of Richmond. And yet General Joseph Johnston—for, of course, it is of him we speak—gave evidence of abilities which entitle him to no mean reputation as a strategist. On the field of Bull Run he was the senior officer, and as he was the first chosen to beat back Northern invasion, so in the last decisive struggle, when Sherman had scattered the army of Georgia and was beginning his famous march to the sea, it was to Johnston again that the Confederate Government turned as the only bulwark of the Carolinas. A history from his own pen, or, as he more modestly styles it himself, a narrative, of the military operations* directed by this eminent soldier in the greatest of modern civil wars, cannot but be highly interesting to the military student. In a brief introduction of less than three lines it is unpretendingly offered as a contribution of materials for the use of the future historian of the war. And it is written in the tone and spirit we should expect from one who had borne himself so steadily against tremendous odds. There is no vain boasting of the superiority of Southern soldiers, and no disparagement of Northern courage. On the contrary, the General goes out of his way on more than one occasion to bear testimony to the gallantry of the foe. And even when writing in self-defence—for the book is essentially a defence of the General against the strictures passed upon him—he never forgets the dignity which becomes his character and antecedents. At the same time the fact that the work is an *apologia*, a justification of his military operations, somewhat detracts from its value: while the omission to supply maps very seriously impairs its usefulness. It is impossible for a reader to follow intelligently the details of a battle, and of the movements which preceded it, without a plan of the field before him. And we would urge upon the publishers of the "Narrative," when preparing for a second edition, to supply this strange omission. Like his more famous chief, General Joseph Johnston was a Virginian, and, like him, too, he held a commission in the United States army at the outbreak of the war. General Johnston devotes a brief space to justify his resignation of his commission, and his passing over to take service with the Confederacy. Undoubtedly it is a very grave step on the part of a soldier to range himself on the side of an insurrection, and one which is rightly judged on the most rigorous principles. But the cases of Generals Johnston and Lee are entirely different from such a desertion as that of the unfortunate Colonel Rossel, or, indeed, from that of any other officer in a European army. The result of the Civil War has decided now that a State has not the right to withdraw from the Union. But when Secession took place, that was not the received doctrine. This is not the place to enter into the constitutional argument, and, indeed, it is sufficient to remark that the whole South repudiated the doctrine in the most practical manner possible, while in the North the Democratic party at least openly maintained that the South was acting within its right. If, then, Generals Johnston and Lee erred, they erred in common with the vast majority of Americans in holding that a State had the right to secede, and that to his State a citizen owed his first allegiance. As long as Virginia remained in the Union both officers retained their commissions and did their duty. As soon as Virginia seceded, both resigned their commissions and hastened to place their services at the disposal of their State. General Joseph Johnston had been the senior in rank in the United States army. At the time of his resignation he was Quartermaster-General with the commission of a Brigadier-General, whereas Lee had been only Lieutenant-Colonel. But on Johnston's arrival in Richmond he found that Lee had been appointed Commander-in-Chief of the army of the State with the rank of Major-General. Johnston was at once given the same rank, and entrusted with the training of the State levies. On the accession of Virginia to the Confederacy, however, General Johnston entered the Confederate service, and received from President Davis the command of Harper's Ferry, while General Beauregard was appointed to the Confederate command at Manassas, Lee still remaining in the service of Virginia. The first serious attack was made by the Federal army under General McDowell against Manassas. Johnston at once hurried to the relief of Beauregard with a portion of his army, leaving the remainder to hurry after him as quickly as it could. He arrived in time to consult with Beauregard, and agree to the plan suggested by the latter. But before the plan could be carried out the Federal General attacked, and Bull Run was the result. This great victory secured Virginia from invasion for the remainder of

the year. McClellan was appointed to the command of the Northern army, and he devoted the autumn and winter to the work of properly organizing and disciplining it. Early in the following spring he moved his forces by water to Fortress Monroe, and thence advanced up the peninsula to invest Richmond. General Johnston assumed the direction of the operations undertaken against him. Johnston strongly urged upon President Davis to fall back upon Richmond, collect there the whole military force of the Confederacy, allow McClellan to approach the city, and then, when he was at a distance from his base, fall upon him, and inflict such a blow as would decide the war at once in favour of the South. A council of war was held, at which Lee was present, and, mainly by Lee's advice, as Johnston states, the plan of the latter was set aside. Under these circumstances General Johnston determined to delay the advance of the enemy by every means in his power, without, however, bringing on a general engagement too soon. Accordingly he occupied in force a defensive line constructed by General Magruder, which stretched from Yorktown to Warwick Court House. The line was too long, and besides admitted of being turned, but the Federal General sat down before it, and erected siege batteries. When they were ready, the Confederates retired. At Williamsburg Longstreet's and Hill's divisions, to allow time for the removal of the baggage and ammunition, engaged a portion of the Federal army and inflicted a loss twice as great as these divisions suffered themselves, and then the army once more fell back slowly to the neighbourhood of Richmond. McClellan's forces in their advance were divided into two parts by the Chickahominy. Johnston took advantage of the separation to direct twenty-three out of his twenty-seven divisions against the Federal left wing, consisting of two corps, or about two-fifths of the entire Federal force. The Battle of Seven Points, which ensued, was indecisive, as night fell before the Confederates could improve the advantage they gained, and General Johnston, having received a severe wound, was never able to resume the contest. A few days later General Lee was appointed to his command. Before Johnston had completely recovered, he was ordered to the West to superintend operations in Mississippi and Tennessee, but want of means compelled him to look on helplessly while Grant reduced Vicksburg and Pemberton's army. The disasters experienced by General Bragg next summoned him to the command of the army of Tennessee. In a campaign of seventy days, opposed to an army under Sherman more than twice as numerous, Johnston boasts—and the boast is corroborated by two of his corps commanders—that constantly fighting partial engagements, and skirmishing day after day, he never lost an action, though he abandoned much territory, and handed over the army to his successor improved in morale and effectiveness. He adds that he had brought the enemy to the neighbourhood of the position where he had intended to make a final stand, where they would not be able to avail themselves of their superiority of numbers, where, if defeated, they would be far from their base, and where, if he himself suffered a reverse, he had a strong position to fall back upon. However, the Government was dissatisfied because he retired persistently before Sherman, and he was removed from the command. He retired into private life, whence he did not again emerge until the army of the Tennessee had been shattered to pieces under Hood, and Sherman had penetrated to the heart of the Confederacy. Then he was once again summoned into the field, but it was only to have the melancholy honour of being the last Southern General who surrendered an army to the conqueror.

The recent death of Mr. Sumner* has called forth a plentiful crop of lives, memoirs, notices, eulogies, and funeral orations, all of which, so far as we have seen, have a common fault. They exaggerate extravagantly the influence and abilities of their subject. The natural desire to speak well of one who has so lately passed away is intensified in the present case by that abnormal hero-worship so strongly developed in the Americans of our day. And hence the impression likely to be left on the mind of a person previously unacquainted with the Abolitionist agitation by a perusal of this biographical literature is, that next to nothing had been achieved by the predecessors of Mr. Sumner, but that his entrance into public life speedily transformed an insignificant clique into an influential national party. The work of Messrs. Chaplin shares in this common defect, and, though the authors tell us that they have had access to private papers and other fresh sources of information, we cannot find that they have made any important addition to what was before known of Mr. Sumner's life. Still the book contains some good anecdotes. But its interest would be greater if it were written in a less pretentious style, and displayed less of the taste of an interviewing reporter.

Anything from the pen of Mr. Wells† is sure to be deserving of attention, and although the subject he discusses in the present little pamphlet is not of great general interest, it yet curiously illustrates one tendency of democratic government in the United States. In the year 1864 some of the American railways connecting the great centres of trade and population, finding postal communication rapidly increasing, began to run what are known as "postal cars." These postal cars are in reality travelling post-offices, which receive the mails unsorted. Post-office clerks make up the bags *en route*; and drop them at the various wayside offices. It will be seen that the accommodation thus afforded to the public is very great. About seventy per cent. of all the matter now con-

* *Narrative of Military Operations directed during the late War between the States.* By Joseph E. Johnston, General C.S.A. New York: Appleton & Co. London: Trübner & Co.

* *Life of Charles Sumner.* By Jeremiah Chaplin and J. D. Chaplin. Boston: Lothrop & Co. Dover, N.H.: Day & Co.

† *The Relation of the Federal Government to the Railroads.* By David A. Wells. London: Trübner & Co. 1874.

vayed by mail is carried in these postal cars, and it is in evidence that, if the Government were obliged to sort all letters and papers in its own post-offices, it would have to hire three or four large warehouses for that purpose in the city of New York alone. Yet the Government contributes nothing to the construction or repair of these cars, and, until last year, it refused to pay more for them than previously to 1864 it paid for mere conveyance. Moreover, it claims the right to send by these cars as many special agents as it deems necessary, and these agents, unlike private persons travelling with free passes, have a right of action against the railways in case of accident. Lastly, the Government insists upon paying the Companies by drafts upon the various post-offices scattered along their lines. In other words, it compels the Companies to collect its revenues for it. The Companies refuse to continue the service on these conditions, and the object of Mr. Wells's paper is to point out the real nature of the pretension put forward by the Government, namely, to compel railways to perform a special service which they have not contracted to perform, in a way dictated by the Government, and at rates of whose sufficiency the Government is the sole judge.

The Reports of the State Board of Health of Massachusetts* have acquired in America a deserved reputation for earnestness of effort to make them what such documents ought always to be, and the present Report will increase this well-earned distinction. It contains a mass of minute information which throws more light upon the actual condition of the greatest of New England communities than is anywhere else to be found within the same compass, and some of the special papers included treat very ably of matters in which we are all intimately concerned. There is, for instance, a paper by the chairman, Dr. Rowditch, on preventive medicine, in which the influence of occupation, recreation, residence, clothing, food, exercise, and the like, in preventing disease, and more especially in preventing the disease from which New England so frightfully suffers—consumption—is discussed in a very instructive manner. One opinion arrived at by Dr. Rowditch, though he freely admits that he has not been able to collect a sufficient number of facts to warrant him in putting it forward with confidence, is, it may be mentioned, that the use of pork as a principal article of food predisposes to consumption. And he seems inclined to think also that salted meats, pickles, and various kinds of pies and cakes, have a similar tendency. Of course it was already well established that all these kinds of food are less nutritious than beef, mutton, fowl, and fish. But perhaps the most interesting papers are those upon the health of farmers, and upon the influence of school-attendance upon health, more particularly upon the health of girls. The paper on the health of the farmers of Massachusetts is especially good, as a type of a kind of which we have unfortunately too few in the official literature of any country. That upon the sanitary aspect of education is also excellent. It tends very strongly to confirm the views put forward by Dr. Maudsley a little while ago.

The next book upon our list is also a publication of a Massachusetts State Board †, and is executed in the same admirable manner. In its first paper it treats of the subject which we have just mentioned—education—but from an entirely different point of view. Its object is to show that the difficulty which we feel so strongly here at home, that of getting the children into the schools, is also experienced in the home of the vaunted common school system. The second paper is an attempt to ascertain the earnings of one class of professional men in Massachusetts. Unfortunately, the attempt is not very successful. The comparative failure must be attributed to the perhaps natural unwillingness of the persons addressed to furnish information, and the want of power in the Bureau to compel answers. The remaining papers are all excellent, and together supply a mass of information respecting the homes and earnings of the working classes, as well as the present state of the various manufactures of Massachusetts, which is invaluable to the student of the social condition of the American people.

Still another official report ‡, less interesting and less readable, yet of value to geologists, metallurgists, miners, and speculators in mines, is that of Mr. Raymond, United States' Commissioner of Mining Statistics. The work treats of the mines and mining of the whole vast region between the Rocky Mountains and the Pacific, and is the fruit of the labours of a large number of contributors.

When Lewis and Clarke ascended the Missouri in 1804, they found four tribes of agricultural Indians, numerous and prosperous, inhabiting eight permanent towns in the Upper Missouri Valley, west of the Dakota nation. All that now remain of these prosperous tribes are collected in one small village of about two thousand five hundred souls at Fort Berthold, Dakota Territory. The four tribes are reduced to three, one having suffered so frightfully from smallpox in 1838 that the few survivors joined the Hidatsa, accepted its chief as theirs, and adopted its traditions, myths, and ceremonies. It is with the language of the tribe thus reinforced that Mr. Matthews§ makes us acquainted. It is a curious,

and to the student of prehistoric man, as well as to the philologist, an interesting fact, that, though the three tribes inhabit the same village, and for at least a hundred years have been near neighbours, living on terms of peace and intimacy, and freely intermarrying, each speaks nevertheless a distinct language. And not only do the languages show no tendency to coalesce, but nothing more than a remote likeness can be traced between two of them—a likeness pointing probably to a common origin in the distant past; while, more remarkable still, no resemblance of any kind has yet been discovered between these two and the third. To make the survival of these languages side by side yet more surprising, Mr. Matthews tells us that almost every member of each tribe understands the language of the others, so that "it is not an uncommon thing to hear a dialogue carried on in two languages, one person, for instance, questioning in Madan and the other answering back in Grosventre, and vice versa." Moreover, many of them are acquainted with the Dakota tongue, and all understand the sign language. So it will be seen that, savages though they be, they are by no means unskilful linguists.

Our readers will recollect the arrest last year of a Correspondent of the *New York Herald* in Cuba on a charge of treason, in having made his way from the Spanish lines to the part of the island held by the insurgents, and thence returned to the Spanish quarters. By the intervention of a British man-of-war, Mr. O'Kelly*, the Correspondent in question, was saved from the fury of those into whose hands he first fell. And his case having been taken up diplomatically, he was, after a weary confinement, conveyed to Madrid by the orders of the Home Government, where, on the advent of Señor Castelar to power, he was finally set at liberty. Mr. O'Kelly has availed himself of his freedom to write a narrative of his adventures and hair-breadth escapes. And as he passed some time with Spanish troops on the march and in camp, visited slave plantations, contrived to elude the vigilance of the authorities and enter the Mambi-land, or insurgent's territory, conversed with Céspedes and other chiefs of the insurrection, and finally made acquaintance with Spanish gaoles and gaolers, both in the colony and the mother-country, it will be seen that the tale he has to tell is sufficiently exciting.

Of a different order is *Syrian Home Life* †, a patchwork composition, compiled from a portion omitted from a former work of an American missionary, old letters from the same to a New York journal, freshly furbished up, and some more letters from other members of the mission.

The object of Mr. Marsh's work ‡ is to trace the character and extent of the changes produced by human action in the physical conditions of the globe, and to suggest the possibility of the material improvement of exhausted regions, such as some of the countries of Southern Europe and Western Asia, which were once the seats of luxurious civilizations and were celebrated for their bounteous fertility, but are now in great part waste and uninhabited. The book is a new edition of an older work, and is in many parts rewritten and considerably enlarged.

The Constants of Nature § is a compilation of specific gravities, boiling and melting points, and chemical formulae, forming the first part of a series to be published by the Smithsonian Institution of Washington.

And in connexion with this work we may notice the three parts of the *Proceedings of the Academy of Natural Sciences of Philadelphia* ||, forming the volume for 1873. The publications of this Society date back to 1817, and are contained in four series of volumes.

To Americans busy in clearing and settling a continent, in making money, and working out the problems of social and political democracy, the study of philosophy offers few attractions. There has as yet, indeed, been no time for the formation of an hereditary leisured class amongst whom the taste for such studies would naturally grow up. And the Colleges and Universities are too poorly equipped to stimulate the growth of the taste. Yet there are a few who venture to follow the highest flights of European speculation. One of these is Mr. Hall, who has translated almost one-half of Dr. Rosenkranz's tribute to Hegel¶, composed on the occasion of his centenary in August, 1869.

We need not expend many words on Mrs. Ward Howe's *Sex and Education*** Mrs. Howe, as the reader may possibly be aware, is one of the leaders of the American Women's Rights party. She looked upon Dr. Clarke's *Sex in Education* as an attack upon her views, and in the present little volume she has undertaken to demolish her assailant. We are afraid, however, that the Doctor will be ungallant enough not to consider himself refuted.

As the first attempts of a young author, the Poems †† of Edith

* *Fifth Annual Report of the State Board of Health of Massachusetts.* Boston: Wright & Potter. London: Trübner & Co.

† *Fifth Annual Report of the Bureau of Statistics of Labour.* Boston: Wright & Potter. London: Trübner & Co.

‡ *Mining Industry of the States and Territories of the Rocky Mountains.* By Bonister W. Raymond, Ph.D. New York: Ford & Co.

§ *Grammar and Dictionary of the Language of the Hidatsa; with an Introductory Sketch of the Tribe.* By Washington Matthews. New York: Cramsey Press. London: Trübner & Co.

* *The Mambi-Land; or, Adventures of a "Herald" Correspondent in Cuba.* By James J. O'Kelly. Philadelphia: Lippincott & Co. London: Trübner & Co.

† *Syrian Home Life.* Compiled by Rev. J. Riley from materials furnished by Rev. H. H. Jessup. New York: Dodd & Mead. London: Sampson Low & Co.

‡ *The Earth as Modified by Human Action.* A new edition of "Man and Nature." By G. P. Marsh. New York: Scribner & Co. London: Sampson Low & Co.

§ *The Constants of Nature.* Part I. By F. W. Clarke, S.B. Washington: Smithsonian Institution.

|| *Proceedings of the Academy of Natural Sciences of Philadelphia.* Philadelphia: Academy of Natural Sciences. London: Trübner & Co.

¶ *Hegel.* By Dr. Karl Rosenkranz. Translated by G. S. Hall. St. Louis: Gray, Baker & Co. London: Trübner & Co.

** *Sex and Education.* By Mrs. Julia Ward Howe. Boston: Robert Brothers. London: Trübner & Co.

†† *Poems.* By Edith May. New York: James Miller.

May are of fair promise. The writer has already acquired considerable power of expression, and is not without an ear for rhythm. Of the next poems* we have less to say. Mrs. Piatt is a veteran author, and she writes verses with considerable facility, but we cannot truthfully call them poetry.

Papa's Own Girl† is a novel with a purpose, the social palace at Guisee furnishing a hint for the plot; and, like most such novels, it is more didactic than interesting.

The next novel on our list, *Prudence Palfrey*‡, has more merit. It is a sketch of clerical life in a New England village, but it is to be hoped the minister is not to be taken as a type of his class.

The magazines § whose titles will be found below call for little notice at our hands. None of the papers are of striking merit, and in general the best are by English writers. Indeed, the fact that contributions are so largely drawn from this side of the Atlantic is itself a proof of the low state of periodical literature in the United States.

* *A Voyage to the Fortunate Isles*. By Mrs. S. M. B. Piatt. Boston: Osgood & Co. London: Trübner & Co.

† *Papa's Own Girl*. By Marie Howland. New York: J. P. Jewett. Boston: Lee & Shepard. London: Sampson Low & Co.

ST. THOMAS'S HOSPITAL, Albert Embankment, Westminster Bridge, S.E.—The MEDICAL SESSION for 1874 and 1875 will COMMENCE on Thursday, October 1, 1874, on which occasion an ADDRESS will be delivered by Mr. MACCORMACK at Two o'clock.

Medicine—Dr. Peacock, Dr. Bristowe, Dr. Clapton, Dr. Murchison. Honorary Consulting Physician—Dr. Barker and Dr. J. Risdon Bennett. Honorary Consulting Surgeon—Mr. Frederick Le Gros Clark. Physicians—Dr. Peacock, Dr. Bristowe, Dr. Clapton, Dr. Murchison. Obstetric Physician—Dr. Barnes. Surgeons—Mr. Simon, Mr. Sydney Jones, Mr. Croft, Mr. MacCormack. Ophthalmic Surgeon—Mr. Liebreich. Assistant-Physicians—Dr. Stone, Dr. Ord, Dr. J. Harley, Dr. Payne. Assistant-Obstetric Physician—Dr. Gervis. Assistant-Surgeons—Mr. F. Mason, Mr. Henry Arnott, Mr. W. W. Wagstaffe. Dental Surgeon—Mr. J. W. Elliott. Assistant-Dental Surgeon—Mr. W. G. Ranger. Resident Assistant-Physician—Dr. Turner. Resident Assistant-Surgeon—Mr. McKellar. Apothecary—Mr. B. W. Jones.

Medicine—Dr. Peacock and Dr. Murchison. Surgery—Mr. Sydney Jones and Mr. MacCormack. General Pathology—Dr. Bristowe. Physiology and Practical Physiology—Dr. Ord and Dr. John Harley. Descriptive Anatomy—Mr. Francis Mason and Mr. W. W. Wagstaffe. Anatomy in the Dissecting Room—Anatomical Lecturers, Mr. Rainey and Dr. R. W. Reid. Practical and Manipulative Surgery—Mr. Croft. Chemistry and Practical Chemistry—Dr. A. J. Bernays. Midwifery—Dr. Barnes. Physics and Natural Philosophy—Dr. Stone. Materia Medica—Dr. Payne. Forensic Medicine and Hygiene—Dr. Stone and Dr. Gervis. Comparative Anatomy—Mr. C. Stewart. Ophthalmic Surgery—Mr. Liebreich. Botany—Mr. A. W. Bennett. Dental Surgery—Mr. J. W. Elliott. Demonstrations of Medical Anatomy—Dr. Payne. Anatomy and Practical Pathology—Mr. H. Arnott. Mental Diseases—Dr. Wm. Rhys Williams.

T. B. PEACOCK, M.D., Dean.

R. G. WHITFIELD, Medical Secretary.

Any further information required will be afforded by Mr. WHITFIELD.

GUYS HOSPITAL.—The MEDICAL SESSION commences in October. The INTRODUCTORY ADDRESS will be given by Sir WILLIAM GULL, Bart., on Thursday, October 1, at Two o'clock.

MEDICAL OFFICERS.

Consulting Physicians—Sir W. Gull, Bart., M.D., D.C.L., F.R.S.; G. Owen Rees, M.D., F.R.S. Physicians—S. O. Habershon, M.D.; S. Wilks, M.D., F.R.S.; F. W. Pavy, M.D., F.R.S.; W. Moxon, M.D. Assistant-Physicians—C. Hilton Fagge, M.D.; P. H. Pye-Smith, M.D.; Frederick Taylor, M.D. Consulting Surgeons—J. Hilton, Esq., F.R.S.; E. Cock, Esq. Surgeons—J. Birkett, Esq.; J. Cooper Forster, Esq.; Thomas Bryant, Esq.; Arthur E. Durham, Esq. Assistant-Surgeons—H. G. Howe, M.S.; N. Davies-Colley, M.C. Consulting Obstetric Physician—Henry Oldham, M.D. Obstetric Physician—J. Braxton Hicks, M.D., F.R.S. Assistant Obstetric Physician—A. L. Galabin, M.D. Ophthalmic Surgeon—C. Bader, Esq. Assistant-Ophthalmic Surgeon—C. Higgins, Esq. Surgeon-Dentist—J. S. A. Salter, M.D., F.R.S. Assistant-Surgeon-Dentist—H. Moon, Esq. Assistant Surgeon—W. Liddell Purves, Esq. Medical Registrar—Frederick Taylor, M.D.; J. F. Goodhart, M.D. Surgical Registrar—Frederick Durham, Esq. Apothecary—James Stocker, Esq.

The Hospital now contains 600 Beds. Of these 221 are for Medical Cases, 250 for Surgical, 25 for Gynaecological, 48 for Syphilitic, and 50 for Ophthalmic Cases. There are also 30 Children's Cots, and 84 Reserve Beds, with 8 in private rooms. In connexion with the Lying-in-Charity, about 2,000 Cases are annually attended by the Students.

Number of Patients relieved during the year, about 61,000.

WINTER SESSION LECTURES.

Medicine—Dr. Wilks and Dr. Habershon. Clinical Medicine—Dr. Habershon, Dr. Wilks, Dr. Pavy, and Dr. Moxon. Surgery—Mr. Cooper Forster and Mr. Birkett. Clinical Surgery—Mr. Birkett, Mr. Forster, Mr. Bryant, and Mr. Durham. Anatomy—Descriptive and Surgical—Mr. Durham and Mr. Howe. Physiology and General Anatomy—Dr. Pavy and Dr. Pye-Smith. Clinical Lectures on Midwifery and Diseases of Women—Dr. Braxton Hicks. Chemistry—Dr. Debus and Dr. Stevenson. Experimental Physiology—Mr. A. W. Reinold.

DEMONSTRATIONS.

Practical Surgery—N. Davies-Colley, M.C. Anatomy—Mr. Clement Lucas, Demonstrator; Mr. Golding Bird and Mr. Jacobson, Assistant-Demonstrators. Practical Physiology—Dr. P. H. Pye-Smith. Morbid Anatomy—Dr. C. Hilton Fagge and Dr. J. F. Goodhart. Cutaneous Diseases—Dr. C. Hilton Fagge.

Clinical Lectures in Medicine, Surgery, and Midwifery, Weekly. Special Classes are held in the Hospital for Students preparing for the Examinations of the University of London, and of the College of Surgeons. The Museum of Anatomy, Pathology, and Comparative Anatomy (Curator, Dr. Fagge) contains 10,000 Specimens, 4,000 Drawings and Diagrams, an unique collection of Anatomical Models, and a Series of 400 Models of Skin Diseases. Gentlemen desirous of becoming Students must give satisfactory testimony as to their Education and Conduct. Fees: £40 for the first year; £40 for the second; £40 for the third; and £40 for succeeding years of attendance. One Hundred Guineas in one payment entitles a Student to a Perpetual Ticket. The House-Surgeons and House-Physicians, the Obstetric Residents, the Clinical Assistants, Preceptors, Dressers in the Eye Wards, and Clinical Clerks, are selected from the Students according to merit. Six Scholarships, varying in value from £25 to £40 each, are awarded at the close of each Summer Session for general proficiency. Two Gold Medals are given by the Treasurer—one in Clinical Medicine, and one in Clinical Surgery. A Voluntary Examination takes place at Entrance, in Elementary Classics and Mathematics. The First Three Candidates receive respectively prizes of £25, £20, and £15. Several of the Lecturers have Vacancies for Resident Private Pupils. For further information apply to Mr. STOCKER, Secretary, or the Dean, Dr. F. Taylor. Guy's Hospital, August 1874.

ST. BARTHOLOMEW'S HOSPITAL and COLLEGE.

SCHOLARSHIPS IN SCIENCE.

Two Scholarships in Science have been founded at St. Bartholomew's Hospital: 1. An Open Scholarship of the value of £100, tenable for one year, to be competed for in September. The Subjects of Examination are Physics, Chemistry, Botany, and Zoology. The Successful Candidate will be required to enter at St. Bartholomew's Hospital in October next. 2. Preliminary Scientific Scholarship of the value of £20, tenable for one year, to be competed for in October next, by Students of the Hospital of less than six months' standing. The Subjects of Examination are identical with those of the Open Scholarship. For further particulars and syllabus of subjects, application may be made, personally or by letter, to THE WARDEN of the College, St. Bartholomew's Hospital.

QUEEN'S COLLEGE, Galway.—SESSION 1874-5.—

FACULTY OF MEDICINE.
The FIRST MATRICULATION EXAMINATION for the Session 1874-5 will be held on Friday, October 10. The EXAMINATIONS for SCHOLARSHIPS and EXHIBITIONS of the First Year will commence on Monday, October 13, for Scholarships and Exhibitions of the Second Year on Thursday, the 20th.
By a recent regulation of the Council, all Scholarships and Exhibitions of the Second, Third, and Fourth Years must now be competed for by students who have attained the requisite standing in any Medical School recognized by the Senate of the Queen's University, and have passed the Matriculation Examination in the College.
At the ensuing Examination, Eight Scholarships, of the value of £25 each, will be offered for competition, viz., Two to Students of the First, Second, Third, and Fourth years respectively. In addition, Four Exhibitions of £40 each will be offered, two to Students of the First, and Two to Students of the Second Year respectively; and Two Exhibitions of £10 each—one to Students of the Third and Fourth years respectively.
All Scholars are exempt from payment of a moiety of the fee for the compulsory classes. This rule does not apply to the Class of Medical Jurisprudence.
By order of the President,
T. W. MOFFETT, LL.D., Registrar.

August 20, 1874.

UNIVERSITY of LONDON.—MATRICULATION and PRELIMINARY SCIENTIFIC EXAMINATIONS.
SPECIAL CLASSES for these Examinations are held at St. Bartholomew's Hospital. The Classes are not confined to Students of the Hospital.
A Class for the Matriculation Examination is held twice in each year, from October to January and from March to June.
A Class for the Preliminary Scientific Examination is held from January to July.
For particulars application may be made personally, or by letter, to the WARDEN of the College, St. Bartholomew's Hospital.

UNIVERSITY COLLEGE, LONDON, SCHOOL.

Head-Master—T. DEWITT KEY, M.A., F.R.S.
Vice-Master—E. R. HORTON, M.A., Fellow of St. Peter's College, Cambridge.
The SCHOOL will RE-OPEN for New Pupils on Tuesday, September 22, at 10.30 A.M. The School Session is divided into three equal Terms. Fee, £2 per Term, to be paid at the beginning of each Term. Gymnastics, Fencing, Drilling, and Advanced Drawing, extra.
Extensive additional buildings, including spacious Lecture Rooms for the Classes of Chemistry and Experimental Physics, have recently been completed for the use of the Pupils attending the School.
A Playground of about two acres in extent, including several Pigeon Cotes, is attached to the School.
Discipline is maintained without corporal punishment.
A monthly Report of the progress and conduct of each Pupil is sent to his Parent or Guardian.
The School is close to the Gower Street Station of the Metropolitan Railway, and only a few minutes' walk from the Termini of the North-Western, Midland, and Great Northern Railways. Season Tickets are granted at half-price to Pupils attending the School.
A Prospectus, containing full information respecting the Courses of Instruction given in the School, with other particulars, may be obtained at the Office of the College.
JOHN ROBSON, B.A., Secretary to the Council.

August 1874.

NOTICE.—ROYAL SCHOOL of MINES, Jermyn Street, London.—The TWENTY-FOURTH SESSION will BEGIN on THURSDAY, October 1. Prospectuses may be had on application.
TRENHAM REEKS, Registrar.

QUEEN'S COLLEGE, 43 and 45 Harley Street, W.

Incorporated by Royal Charter, 1834, for the General Education of Ladies, and for granting Certificates of Knowledge.
Patron.
HER MAJESTY THE QUEEN.
H.R.H. the PRINCESS of WALES.
Visitor—THE LORD BISHOP of LONDON.
Principal—The Rev. J. L. DAVIES.
The CLASSES will re-open for the Michaelmas Term on Monday, October 5. Individual instruction is given in Vocal and Instrumental Music. Special Classes are formed for Greek and Conversation in Modern Languages. Boarders are received within the College walls by Miss WOOD. Prospectuses may be had on application to the Faculty, 68 Wimpole Street, W.
E. H. PLUMPTRE, M.A., Dean.

QUEEN'S COLLEGE SCHOOL, 43 and 45 Harley Street, W.

For GIRLS from Five to Fourteen.
The CLASSES will open for the Michaelmas Term on Monday, September 22. Prospectuses may be had on application to Miss PARRY, 58 Wimpole Street, W.
E. H. PLUMPTRE, M.A., Dean.

LADIES' COLLEGE, POLYGON HOUSE, Southampton.

Patron.
The Right Hon. the LORD BISHOP of WINCHESTER.
President.
The Right Hon. COWPER-TEMPLE.
Hon. Secretary.
Surgeon-General W. C. MACLEAF, M.D., C.B.
Lady Principal.
Miss DANIELS, assisted by English and Foreign Governesses and a Professional Staff.
TERMS MODERATE.
The COLLEGE RE-OPENS on September 15.
Applications for Nominations to be made to the Lady Principal without delay.

LADIES' SCHOOL, TAUNTON, for the DAUGHTERS of GENTLEMEN.—The Education given is a thoroughly sound one, and the assistance of experienced Masters is procured in the study of those branches of learning which are often omitted in the Education of Ladies. The real work done is tested by the College of Preceptors, and the Oxford Local Examinations, and by Examinations in the School itself. 7 Pupils passed the Senior Oxford, and 6 the Junior, in the June Examinations, 1872-73; and at the Christmas Examinations of the College of Preceptors, 17 Third-Class, 14 Second-Class, and 5 First-Class, including Special and Honour Certificates, were gained by the Pupils; and the College First Prize for English subjects at both Examinations. Prospectuses forwarded on application to Miss REED, Mary Street House, Taunton. The next Term will begin on September 21.

D O V E R C O L L E G E.

President—The Right Hon. Earl GRANVILLE, K.G.
Head-Master—The Rev. M. BELL, M.A., late Scholar of Ch. Coll., Cambridge.
A liberal education by Graduates of the Universities.
Tuition Fees, from Ten to Fifteen Guineas per annum. Board in the Head-Master's House, £10 per annum.
The College will re-open on September 15.
Apply to the HEAD-MASTER, or the HONORARY SECRETARY.

THE WESTERN COLLEGE, BRIGHTON.

Principal—Dr. W. PORTER KNIGHTLEY, F.C.P.
The Pupils of this long-established School enjoy the highest Educational advantages in preparing for Mercantile Life, as well as for the various Competitive Examinations, whether of the Oxford and Cambridge Local, the University Matriculation, the Civil Service, the Military College, or Direct Commissions, in all of which Dr. KNIGHTLEY's Pupils have taken high places in the Honour List. In addition to the intellectual and moral training, superior health conditions are secured by all the appliances of a well-arranged residence in this favourite watering-place. Prospectuses of terms and Class-lists may be obtained by application to the PRINCIPAL, personally or by letter.

LEAMINGTON COLLEGE BOARDING HOUSE.—The

NEXT TERM commences on September 21. Inclusive Terms from 70 to 90 Guineas. For some of Professors and Teachers in a special Tutor and separate Dormitory, &c., for small boys. For particulars apply to the Rev. J. WOOD, Head-Master, or to the Rev. J. S. HODGKIN, Chaplain and House-Master.

FULLANDS, TAUNTON.—OXFORD MATRICULATION

and RESPONSES, and CAMBRIDGE PREVIOUS EXAMINATIONS.—PRIVATE TUTORING in Classics, and in the Languages, for the Universities, the Indian Civil Service, Woolwich, and other Examinations generally. The next Term will begin on September 21. For Prospectuses apply to the Rev. the SECRETARY.

FULLANDS SCHOOL, TAUNTON.—The aim of Fullands

School is to provide for the BOYS of GENTLEMEN a thoroughly good Education, similar to that given at the Public Schools, but at a moderate cost.
Principal.
Mr. REED, Fellow of the College of Preceptors, London.

Head Mathematical Master—Rev. WILLIAM REED, M.A., St. John's College, Cambridge; 10th Senior Optique, Tripoli, 1869.
Head Classical Master—FRANCIS REED, Esq., B.A., Exeter College, Oxford.

These are Class School Terms in the gear of an average duration of Thirteen weeks each. The Michaelmas Term begins on September 21, 1874.
Prospectuses may be obtained on application.

CITY of LONDON SCHOOL.—A GRADUATE is required

to teach above ELEMENTARY CLASSES temporarily. Apply, any evening after 7 P.M., on or after the 1st inst., at 25 Abbey Road, St. John's Wood, N.W.

A BINGDON SCHOOL (Six miles from Oxford).—NEXT

TERM begins on September 15. Another Dormitory is now ready for occupation. A Public School Training. Moderate and inclusive charges. University and Entrance Scholarships.—Address, Rev. E. SUMMERS, Head-Master.

JERSEY.—ST. AUBIN'S SCHOOL.

Head-Master—Mr. J. E. VIBERT, M.A., M.C.P. Capital climate. Healthy situation. Special attention to Modern Languages. Prospectuses on application.

ARMY, CONTROL, CEYLON WRITERSHIPS, INDIAN

FORESTS, and ALL DEPARTMENTS of CIVIL SERVICE.—Mr. W. M. LUPTON, Author of several Manuals for Competitive Examinations, has for many years successfully PREPARED CANDIDATES for the above.—Address, 9 Rathbone Place, Oxford Street.

AN OXFORD M.A., late Scholar of his College, Graduate in

Honours, a Clergyman of nine years' standing, and Married, residing at a fashionable watering place, with the sea view, is willing to receive One or Two additional PUPILS, to be prepared for the University, &c. First-class references. Good inland Boating and Fishing.—Address, Rev. M.A., 14 Wellington Esplanade, Lowestoft.

PRIVATE TUITION for ARMY, COOPER'S HILL, CIVIL

SERVICE, WOOLWICH, and UNIVERSITY.—Rev. Dr. HUGHES (Wragham, Cam.) has passed over 300, and occasionally has VACANCIES. Also quite distinct young Boys.—Exeter, W.

FOR COOPER'S HILL, WOOLWICH, and MATHEMATICAL

SCHOLARSHIPS.—For List of Honours already gained, address Rev. F. R. DREW, M.A., Senior Master on the Modern side, Malvern College, Great Malvern. Terms for Board, £5. 50 to 50 Guineas including Tuition.

EDUCATION for BOYS, free alike from Clerical and Dissenting

influences, in the Family of a LAYMAN, a Cambridge M.A. of much Experience. Ages, Ten to Fourteen. Terms high.—Address, THROSBY, Messrs. Kerby & Endean, Publishers and Booksellers, 100 Oxford Street.

MR. E. H. COLERIDGE (M.A. Balliol College, Oxford) pre-

pare PUPILS for the Entrance Examinations to the Public Schools. Terms 120 Guineas a year.—Address, BESMOND, Chertsey.

DELICATE and BACKWARD BOYS.—A GRADUATE

(Married) of Trin. Coll. Cam., an Old Rugbyman, has VACANCIES for TWO PUPILS for his next Term. He offers Classes, Mathematics, French, and thorough German, and every care and home comfort for delicate Boys, and if desired, Hunting, Shooting, and Fishing. Terms, £6 to 20 Guineas, according to age.—Address, Rev. H. R. L., Hildgate Rectory, Much Wenlock, Salop.

TUTORSHIP at HOME or ABROAD, or CLASSICAL

MASTERSHIP desired by an OXFORDMAN (Scholar of College and Honours in Final Classical Schools, 1874). Highest References.—Address, RUSSELL, Post Office, Hildesheim, Suffolk.

ROOKE—BAMBRIDGE.—At St. John's Church, Windsor, by

the Rev. S. J. Stone, M.A., the Rev. TOM ROOKE, formerly Curate of Monkton, Dublin, and Windsor (late Organizing Secretary of the Church Temperance Society, and Chaplain to St. George's Hospital), to HARRIET BAMBRIDGE, late Lecturer and Assistant Postmistress, Windsor, eldest daughter of Mr. George Bambridge, Postmaster and Schoolmaster, Windsor, July 30. No Card.

SUMMER TRIP to GERMANY and BACK in a WEEK,

allowing time for a visit to the Harz Mountains, Palace of Wilhelmshöhe, &c.—One of the North German Lloyd's Steamers leave Brunswick Wharf, Blackwall, every Wednesday and Saturday for Bremen. Return Fares: Saloon, £3; Fore Cabin, £1 10s. Children under ten years at Half-fare. Apply at Chaplin's Universal Office, Regent Circus, or to Phillips, Graves, Phillips, & Co., St. Dunstan's House, Cross Lane, Great Tower Street, London, E.C., and 25 South John Street, Liverpool.

DAYS, allowing time for a visit to the magnificent Waterfalls at Trollhattan, the beautiful lakes Western and Vettern, with unrivalled surrounding scenery. The twin screw-steamers *Leopold-August* and *Borg* are despatched from London, Hillwall Dock, on Thursdays and Fridays alternately. Fare, Saloon, £3 5s.; Return Ticket, available for one month, £4 14s. 6d. Provisions obtainable on board at tariff prices. Apply at Chaplin's Universal Office, Regent Circus, or to Phillips, Graves, Phillips, & Co., St. Dunstan's House, Cross Lane, Great Tower Street, E.C., and 25 South John Street, Liverpool.

SUMMER TRIP to HOLLAND and BACK in FOUR

DAYS, allowing time for a visit to the interesting Cities of Amsterdam, Haarlem, Hague, Schiedamschen, or Utrecht. The favourite Steamers *Rotterdam* and *Edinburgh* leave London alternately every Wednesday and Saturday for Rotterdam, embarking Passengers from Brunswick Wharf, Blackwall. Return Fares: Saloon, £1 14s.; Fore Cabin, £1 4s. 6d. including Rieuwland's Fee, but exclusive of Provisions supplied on board.—Apply at Chaplin's Universal Office, Regent Circus, or to Phillips, Graves, Phillips, & Co., St. Dunstan's House, Cross Lane, Great Tower Street, E.C.

SANATORIUM.—SUDBROOK PARK, Richmond Hill.

Physician—Dr. EDWARD LANE, M.A., M.D., Edin.
For Invalids and those requiring rest and change. Turkish Baths on the premises.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and

Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Collee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.
ROBERT PARK, Manager.

ILFRACOMBE HOTEL, Ilfracombe, North Devon.—Delightful

Location. Beautiful Scenery. 250 Rooms. Appointments perfect. Cuisine excellent. Wines choice. Accessible from all parts by Steam and Rail (see Time Tables).

E. DENT & CO., 61 Strand, and 34 Royal Exchange, Manufac-

turers of CHRONOMETERS, WATCHES, ASTRONOMICAL and TURRET CLOCKS, to Her Majesty, H.R.H. the Prince of Wales, and H.I.M. the Emperor of Russia; Makers of the Great Clock of the Houses of Parliament, and of the New Standard Clock of the Royal Observatory, Greenwich. Catalogues on application.—E. DENT & CO., 61 Strand, 34 Royal Exchange (adjoining Lloyd's), and Factory, Savoy Street, London.

WILLIAM S. BURTON, GENERAL FURNISHING

IRONMONGER, by Appointment to H.R.H. the Prince of Wales, sends a CATALOGUE GRATIS, post paid, containing upwards of 400 Illustrations of his unrivalled Stock of

Electro Plate	Iron and Brass Bedsteads
Britannia Metal Goods	Bedroom Cabinet Furniture
Tea Trays	Dining- and Drawing-room Furniture
Urn and Kettles	Chimney and Pier Cases
Hot-water Dishes	Turnery Goods
Clocks and Candelabra	Kitchen Utensils
Table Cutlery	
Marble Chimney-pieces	
Kitchen Ranges	
Bedding and Bed Hangings	

with Lists of Prices, and Plans of the 30 large Show Rooms, at 30 Oxford Street, W. 1, 1A, 2, 3, and 4 Newman Street, 4, 5, and 6 Perry's Place, and a Newman Yard, London, W. The Cost of delivering Goods to the most distant parts of the United Kingdom by Railway is trifling. WILLIAM S. BURTON will always undertake delivery at a small fixed rate.

MAPPIN & WEBB'S**A 1 SPOONS and FORKS.****GUARANTEED to LAST****TWENTY YEARS.**

(PATENTERS OF THE "CLUB" BOTTLE-HOLDER.)

FRANCE.

MARSHAL MACMAHON is said to have returned to Paris very much disappointed with the results of his tour in Brittany. There was no want of proper politeness in the reception bestowed on him, and there was an ample recognition of his own personal loyalty and good intentions. But there was not the slightest enthusiasm, and where he had hoped to find gratitude for what he had done, and a favourable appreciation of what he intended to do, he found apprehension, a vague sense of disquiet, and a disposition to hint to him in a cautious and polite way that he was somehow on the wrong tack. It does not seem to outsiders very surprising that he should have had this kind of disappointment to endure. But it is also easy to understand that he may have felt keenly the disappointment which he has had to undergo. When the Legitimist scheme fell through last autumn, France was not ready for any definitive form of government. The Orleanists were entirely out of the field owing to the Fusion. The Imperialists had not begun to recover from the shock of Sedan. The Republic might have been established if the Assembly had been dissolved; but the Assembly could only at that time have been dissolved by force, and a Republic the existence of which had been owing to a *coup d'état* would have had a fettered and frail life. That a breathing time was necessary for all parties was obvious, and it was a great thing that an opportunity of gaining a breathing time should be given by a chief of the Executive who was respected by all parties, hated by none, who was fairly popular with some important sections of society, and who had not the slightest wish to overpower the law, or to set up a military dictatorship. Marshal MACMAHON has procured France tranquillity. Good order reigns everywhere. He has scrupulously respected the law. The army is considerably improved, and has been made as little political as possible. The foreign policy of France has been brought into a liberal and consistent shape. Without loss of dignity every effort has been made to be conciliatory, and the mistakes which the effervescence of the country against Germany seemed likely to cause at one time have been avoided or repaired. Marshal MACMAHON has not been a party man. He has not excluded old servants from serving the country because they served under a fallen dynasty. He has not been harsh, or cruel, or vindictive. What he was wanted to do he has done well. He has given France that which he undertook and was asked to give it. The Assembly has certainly not distinguished itself lately, and has shown a fatal want of common sense and political foresight. But this is not at all the MARSHAL'S fault. He has looked on quietly while the Assembly has been going on from one scrape to another; and the only time he has interfered has been to extricate it from the embarrassment in which it found itself from not being able to decide what Ministers should have its confidence. How, then, Marshal MACMAHON may have well asked himself, did it happen that his tour was a failure, that no one seemed to recognize his services, and that the form of government which had been created to save France from anxiety was found practically to be itself a cause of anxiety?

The reason is obvious; the Septennate is only a temporary expedient, and as time goes on, the inconveniences of a temporary expedient make themselves felt. For seven years the MARSHAL says he and his Septennate are going to endure. That, he says, is the law, and he will take care to see the law respected. But no one can possibly be sure that

there will be even this amount of respite. Circumstances may easily be too strong for him. There must be a new Assembly before long. How could he retain power if the nation by its vote expressed a clear wish that the PRINCE IMPÉRIAL should be placed on the throne? If the new Assembly was strongly Republican it would no doubt organize his Septennate for him, but it would organize it in a distinctly Republican sense; and then, if he did not resign, he must either quarrel with the Assembly and show himself willing to abandon his position of a rigid upholder of the law, or he must be willing to act, not as a man above all parties, but as the accepted chief of one triumphant party. Even if it is supposed that the Septennate will really last seven years, what are quiet people to do meanwhile? How are they to behave? To whom are they to look? To whom are they to apply? What latitude is to be given to contending parties? The newly elected member for the Calvados has issued an address to his constituents in which he says that he frankly accepts the Septennate—as every one does nominally—but at the end of the Septennate he advises his countrymen to recall a dynasty which, in spite of its final errors, bestowed great benefits on the country. These are his opinions, and he is quite entitled to announce them. The Septennate avowedly leaves open what is to happen at the end of the seven years. But meanwhile no party knows exactly what it may do and what it may not do. The Bonapartists are treated as public enemies if they conspire—that is, if they combine to work for the triumph of their party when the Septennate is finished. Extreme Legitimists are being withdrawn from posts where their official position might make them dangerous. When Marshal MACMAHON was touring in Brittany, the only political cry he heard was “Vive la République!” and no doubt most of the Breton towns are Republican. But it has been truly remarked that any other cry would have been illegal and seditious. If an enthusiast had shouted “Vive le Roi” or “Vive le Prince Impérial,” he would have been immediately arrested. All parties alike are told that they must wait for seven years, but meanwhile one party alone has the advantage of a legal existence. This produces irritation and confusion. In daily life Frenchmen are always wanting a thousand things which they look to some one with influence to get for them. But who is to say where the centre of influence will be at the end of seven years? It is not a very high way of looking at things to consider in what quarter it will pay best to bestow votes and obsequiousness. But it is a very French way of looking at things, and, in the present state of things, Frenchmen with an eye to their private advantage are very much puzzled. They may be courting a Legitimist or an Imperialist prefect, and may find that all their labour is destined to be thrown away; and they feel it very hard on them that, when they would have been just as ready to toady a Republican, they should not have been helped to know which was the rising and which the setting sun. These general perplexities, these private uncertainties, must before long bring on a crisis, and it is quite obvious what this crisis will be. The immediate future of France depends on the Orleanists. If they pronounce for a Republic, there will be a Republic with a fair chance of lasting. If they hang back, and let things glide on, there will be a restoration of the Empire. We hear of one Orleanist of local eminence—the Vice-President of the General Council of the Gironde—who has already made up his mind, and who, having been a distinguished Orleanist, now recognizes that the Republic is the only possible Government for him.

and men like him. The question is whether his example will be generally followed.

There is also another reason why the Septennate causes uneasiness, which has been very well explained by M. MICHEL CHEVALIER in a recent number of the *Revue des Deux Mondes*. The Government of the Septennate is a temporary expedient, and lives by temporary expedients. It cannot afford to take a general and wide view of France and its requirements. Wherever it is thought that a little money can be got, a new tax is put on, and no account is taken of the incidental effects of such a tax on the industry and commerce of the community. France is falling behind its rivals and neighbours in the means of transport and in education. Local railways are discontinued even when the departments are willing to pay for them, because the central authorities stand by the old railways, which dislike these rural innovations, and from which it is easy to collect the taxes that have been recently imposed. The transport of goods by slow trains is now taxed, and the tax helps to make it unprofitable for different parts of the country to exchange their products. The large sums that have been spent on the equalization of France remain comparatively idle because the works wanting to complete the system are not taken in hand. The small operations of commerce are fettered in every way, and the postal and telegraphic arrangements are conducted with the view of getting a trifling revenue for the State, and not with that of making the country generally alive and active. At every turn the thought is forced on the mind that those who govern are acting like clerks anxious to make up a sum, and not like strong intelligent governors taking thought for France as a whole. Possibly M. CHEVALIER may exaggerate his case, and undoubtedly the whole complaint seems to Englishmen too much founded on the assumption that a Government ought to do everything. But then it is not as if the present Government left things alone. On the contrary, it interferes with everything. Frenchmen do not mind that; but they ask, or at least the more intelligent of them ask, that if Government interferes it shall interfere wisely. The French of the present generation have been accustomed to something better than they have now. It was the great merit of the Empire that it did, according to its lights, look on France as a whole, and endeavoured to shape its measures so that France generally should advance in wealth. The Emperor forced the Treaty of Commerce on the country with this object, and the country learnt to recognize that the Emperor was right. It is not therefore to be wondered at that many intelligent Frenchmen wish for a Government sufficiently definitive and strong to do something like what that of the Emperor did. Of course in a time of financial difficulty such as that which the war has caused, the Government cannot do as much, however wise it may be, as the Emperor did in his palmy days. Reasonable men would make reasonable allowance for the difficulties which every French Government must, under present circumstances, have to encounter. But it is one thing to have to do with a Government which even under difficulties is still following a broad and enlightened commercial policy; and it is quite another thing to have to do with a Government which, like that of the Septennate, has no commercial policy at all except that of collecting every sou it can get hold of and of letting things generally drift as they please.

THE BRUSSELS CONFERENCE.

THE abortive proceedings of the Brussels Conference will probably prevent for some time the renewal of premature attempts to substitute a code for the common law of nations. There is something paradoxical in the project of settling beforehand in friendly discussion the methods by which contingent quarrels are to be conducted. The nearest analogy to the Brussels Conference was furnished by the rules of duelling which were drawn up in Ireland during the last century for the guidance of the Bar, of the Bench, of Parliament, and of society in general; but even in that case the legislators were not necessarily future combatants, while the European Powers represented at Brussels had no possible enemies but their colleagues in the Conference. In meetings of the representatives of independent States, as in other deliberative assemblies, it is necessary to settle disputed questions by a majority of votes, but a Conference differs from a Parliament in the un-

equal authority of its members. The House of Commons, notwithstanding its laudable attachment to party discipline, delights in occasional opportunities of defeating the leaders on both sides when they happen for once to be united. When Holland, Belgium, and Spain outvoted Russia and Germany, the probable course of future wars is not affected, though weaker States are fully justified in refusing their assent to proposals which are made in the interest of great military Powers. It is true that the new rules which were rejected by the Conference might have made little practical difference in actual war. Holland is, with or without an international code, incapable, except with the aid of powerful allies, of resisting an attack by Germany or France. NAPOLEON III., in the project of treaty which he incautiously tendered for the acceptance of Prussia, took it for granted that he could at any time annex Belgium without serious resistance. The principal objection to new military legislation is that it would supply causes of complaint or pretexts of oppression when the Government of an invaded country found it convenient to use a mode of resistance which might have been directly or constructively prohibited. If the wolf and the lamb had held a Conference before their final collision, a rule would probably have been suggested or enacted which would have rendered it unlawful to drink of the stream either above or below the place which might be selected by the stronger belligerent.

Baron JOMINI seems to have well deserved the vote of thanks which rewarded his labours as President of the Conference. It was his duty to procure, if possible, the adoption of the Russian proposals, and in default of success to persuade his colleagues to adopt some form of resolutions which would serve to conceal his failure. With his hereditary knowledge of military matters Baron JOMINI seems to combine the diplomatic virtues of courtesy and adroitness. He may perhaps in an early stage of the proceedings have arrived at the conclusion that the project of a code of war was hopeless, and that it would be of little use if it obtained the assent of the majority in the Conference. The United States were not even nominally represented, and England only appeared by an agent who was prohibited from voting except under direct instructions from his Government. It was improbable that France would cordially approve of proposals supported by Germany; the minor States consistently opposed every provision which appeared likely to interfere with the defence of invaded countries. Even if the resolutions of the Conference become a part of the law of nations, they will only add a formal sanction to rules which had long before been tacitly adopted. If a countryman working in the fields, with a gun hidden near him, shoots a soldier of an invading army from behind a hedge, he will be liable to the summary execution which he will fully deserve. On the other hand, any distinctive badge will authenticate the right of a captured combatant to be treated as a prisoner of war; and the representatives of Holland, Belgium, and Switzerland voted against the insertion of the condition that volunteer corps must be under the control of the general of the regular army. Inhabitants of a country occupied by an invader will undoubtedly be shot in the future, as in the past, if they are detected in conveyance of aid or information to their own Government or its officers; but they will have the satisfaction of knowing that the drumhead court-martial has sentenced them in accordance with the customs and necessities of war, and not because they have been formally recognized as spies by the Conference of Brussels. French residents at Versailles fully understood in 1870 the risk of communicating with their countrymen in Paris.

It is not yet known whether the English Government has approved the resolutions of the Conference, or whether they are to be formally notified to States which took no part in the proceedings. The wonderful complications which have resulted from the unfortunate Treaty of Washington may serve as a warning against the hasty publication of international rules of war which happen not to be generally binding. The English and American Governments, after undertaking by treaty to communicate to other Powers their newfangled rules, discovered that their joint legislation was ambiguous, if not unintelligible. The opposite interpretations which they respectively placed at Geneva on phrases which had been devised only a few months before placed an obvious difficulty in the way of the performance of their obligation to invite the adhesion of the rest of the world to their separate agreement. Any

Government which might have received communication of the rules would have naturally inquired whether they were to be understood in the English or American sense, or whether a third party was entitled to affix his own meaning to the mysterious document. Mr. GLADSTONE, with characteristic indifference to questions which concern the honour rather than the pecuniary interest of the country, once carelessly informed the House of Commons that the new rules had been notified to foreign Powers in accordance with the Treaty; but he afterwards learnt from his colleague at the Foreign Office that it had so far proved impossible to comply with the undertaking. Mr. FISL, in consistency with the uniform policy of his Government, declined any aid in the removal of an embarrassment which seemed to affect England more immediately than the United States. He was willing to communicate the text of the rules without gloss or comment, but he reserved the right of interpreting them in any sense which might suit the policy or interest of the United States. The consequence has been that the Treaty so far remains unfulfilled, and the Government of Washington is probably aware that the people of the United States are perfectly indifferent to the fate of rules which once for all served the purpose for which they were designed in the Geneva Arbitration. If the Russian Government thinks fit alone, or in concert with any of its allies, to recommend the Brussels Resolutions for general adoption, the proposal will be courteously received and afterwards forgotten.

There appears to be no sufficient ground for the conjecture that the Conference was suggested by Russia through jealousy of the recent pretensions of Germany to European supremacy. It is possible that the refusal of Russia to recognize the existing Government of Spain may be explained by a natural wish to assert the independence of her own policy. There is no doubt that during the interchange of visits by the three Emperors in 1873 some general understanding was established as to the pursuance of a common policy in certain events; but the extent and limits of the agreement are unknown, and it may probably not have included questions such as the recognition of Spain, of remote or secondary interest. The object of Germany must have been to detach Austria and Russia from a French alliance; and all the Powers may have felt an almost equal interest in the maintenance of peace. Russia can be exposed to no danger from Spain; and it was unnecessary to adopt the natural resentment of Germany on account of the murder of Captain SCHMIDT. The diplomatic correspondence preparatory to the Conference, as far as it is known by the publication of the English Blue Book, indicates an anxious desire on the part of Germany to promote the success of the Russian proposals. If in the course of the deliberations General VOICHTS RUTZ was even more zealous than Baron JOMINI himself in defending the interests of invading armies against patriotic defenders of an occupied territory, the policy of the German and Russian Governments was essentially the same. The Italian plenipotentiary, who seems to have taken little part in the discussion, had been instructed to support the proposals of Russia. Any disciples of MAZZINI who may still be found in Italy may probably have resented the condemnation of their master's doctrine, that foreign occupation ought to be resisted by the daggers of an indignant population precipitating itself in irresistible numbers on the astonished armies of the alien. As it was not by such means that the liberation of Italy was accomplished, the Government of Rome may be excused for inclining to the side of regular armies against tumultuary insurrection. The Conference has fortunately done no mischief except to the cause of unnecessary changes in international law.

THE EMIGRATION CONTROVERSY.

THE controversy whether emigration is a good thing has the advantage of being necessarily interminable. Like most other operations, removal to a new country is desirable or inexpedient according to circumstances; but on the whole a dissatisfied agricultural labourer is more likely to improve his position by settling in Canada, in New Zealand, or perhaps in some of the Western States of America, than by staying at home and striking for an increase of wages. Discomfort and excess of toil are in themselves objectionable; but farm-labourers, using their experience as a test, are not likely to be excessively delicate in the matter of food and lodging. Although

they may have to learn new methods of applying their strength, the nature of their previous employment has been more various than that of town-bred artisans. Every rural labourer can use a spade, an axe, and a pickaxe; and he knows something of cows, pigs, sheep, and horses. In a new country he will always command higher nominal wages than at home; and, if he is fortunate enough to save money, he will ultimately be able to invest his little fortune in freehold land. His children, brought up in the ways of their adopted home, will have no difficulty in acquiring independence. The highly coloured statements of emigration agents, though they may be neither disinterested nor strictly accurate, afford the best proof that there is a demand, and therefore a market, for labour. Governments and private associations would not take the trouble to advertise the advantages of emigration if they were not anxious to increase the working population. In thinly inhabited countries every additional settler who cultivates his own lot of land adds to the value of his neighbour's property. It is possible that any particular district may be overstocked with blacksmiths or with carpenters, though skilled mechanics will sooner or later be able to secure a comfortable livelihood; but it might have seemed impossible that there could be too many hands employed in ploughing, in sowing, and in reaping. Yet Mr. MASON, an able American writer, has published in the current number of the *Fortnightly Review* an argument which leads to the conclusion that, "save under very exceptional circumstances, chief among which is the possession of considerable capital, the working-man who comes to the United States now, comes to sure and speedy pauperism." It is lucky, rather for the rest of the community than for themselves, that many English labourers are not of an enterprising disposition. In Suffolk it appears that some of them reject the overtures of the emigration agents on the ground that they prefer staying at home to being sold as slaves. Some of them are perhaps acute enough to foresee that they will derive a benefit from the emigration of their more active comrades, who will raise the price of wages at home by ceasing to compete with them in the labour market.

It is highly probable that, as the practice of emigration becomes more familiar to the minds of English labourers, it may attain large and inconvenient dimensions. There is no reason why it should be thought more difficult to emigrate from England to Canada than from Massachusetts or Western New York to the valley of the Mississippi. A sea voyage is scarcely a greater hardship than a long railway journey, except for the annoyance of sickness. The difference is rather one of national habits and modes of thought than of geographical convenience. Americans are educated in the belief that they are at home in any part of the States, and they find in fact, wherever they go, the same local institutions. Since the recent extension of railways it has been usual for whole village communities in New England to emigrate in a body to the more fertile soil of the West. They take with them their friends, their associations, their several trades and employments, and, above all, a considerable amount of capital, and perhaps they give the new settlement the name of their former home. After a short time nothing is changed except that in a more genial climate and on a more fertile soil they find themselves richer than before. The Welsh, who are of a more migratory and more thrifty character than the English, have in some instances adopted a similar course. There are settlements in the Western States with Welsh chapels and names brought from home, where resolute attempts to keep up the use of the ancient tongue are still not wholly abandoned. The more general migration of the rural population of the Atlantic seaboard excites serious apprehension. Large tracts of country have already relapsed into wilderness or forest, and it becomes more and more difficult to retain a sufficient amount of labour on an ungrateful soil. The contented rural life which is a favourite theme with American novelists is in the East gradually becoming obsolete. The Irish have to a certain extent taken the place of the more fastidious natives, contenting themselves with extracting a more frugal livelihood from the land; but as a general rule it is found economically impracticable to replace by artificial methods the elements which are extracted from the soil. The land of the Eastern States constantly becomes poorer where it is cultivated, and the Irish incline more and more either to stay in the great towns or to follow the westward stream of emigration.

As to the prospects of emigrants of the more educated

class, there is little difference of opinion among persons of competent knowledge. A small capital will produce a much higher return where money is comparatively scarce, and in the hands of an active man who is able and willing to work it may multiply itself rapidly. On the other hand, a small fortune is easily lost in hasty or injudicious investments, and no kind of speculation is, in default of local knowledge, more uncertain than the purchase of land. Adventurers of the middle class without capital have scarcely a chance of success either in the colonies or in the United States. In the great American cities they are forced to compete with large numbers of native candidates for employment who are crowding more and more from the country into the towns. One effect of general though superficial education, and of the wide diffusion of popular literature in America, has been to render the dulness and obscurity of rural life distasteful to the younger generation. Rude plenty and tranquillity are found less attractive than the hope of wealth or the excitement of political notoriety. A clerk, a lawyer, or a schoolmaster has a better prospect of rising in the world than a farmer, although he may be exposed to greater risk of failure. A foreigner necessarily competes at a disadvantage with an American, who is probably at least his equal in capacity, and who commands more favourable opportunities. If any young man who cannot maintain himself in England by manual labour is determined to emigrate, he has a better chance of success in New York or Philadelphia than in any English colony. The correspondence on emigration which has lately appeared in the newspapers throws some light on the precarious nature of the enterprise.

It would probably be found on inquiry that the literary and professional class contributes but little to the internal migration from the more settled parts of the Union to the Western States and Territories, but the demand for lawyers and newspaper writers is more than amply supplied. Clerks and shopmen have a wider field of employment at home than in any other part of the world. In their own country it matters little whether they stay or go, while the movements of the agricultural population may become in the highest degree important. A purely cosmopolitan philanthropist ought perhaps to approve of any change which is for the benefit of those whom it immediately concerns. If the inhabitants of an English county were collectively removed to the prairies, their labour would perhaps be more productive and their own condition more prosperous than at present; yet patriotism always includes a local element, and desires that the objects of its regard should not become aliens. Thirty or forty years ago a general impression prevailed that population in England was pressing on the means of subsistence. Before the introduction of ocean steam navigation it was improbable that the redundancy would be corrected by emigration, and it has been relieved by different methods. The rural districts have in the interval not become more populous, but the enormous increase of manufacturing, commercial, and mining industry has absorbed more than the surplus. In most parts of the country it has now become difficult to find hands for all the work which is required; nor would it even have been possible except by the increased use of machinery to get in the late harvest. Farmers in the Eastern counties and elsewhere will, if they are well advised, not press too far the consequences of their recent discovery that they have sometimes employed a superfluous number of workmen. It is said that some Suffolk employers find that by dispensing with a fourth or fifth part of their customary staff of labourers they can secure a more profitable return. It is well known that prosperous farmers sometimes undertake unnecessary jobs, either to gratify their own taste for finish and completeness or for the purpose of providing occupation for workmen whom they are unwilling to dismiss. It is natural that the late struggle should have suggested to them the expediency of measuring their expenditure by their actual wants, and that they should accept the challenge of their former dependents to regulate all industrial relations by the law of the market. When temporary irritation has subsided their more generous instincts will be found their safest guides. Their victory in the struggle with the Labourers' Union was only rendered possible by the existence of an ample margin between their urgent necessities and their ordinary scale of employment. It was proved by experiment that they had paid the full price of labour and something more; and that they had not, until they were compelled to act in self-defence, brought in strangers to

compete for their benefit with their regular workmen. If the employers should now deliberately restrict their outlay in wages, this will directly promote the migration of labour either into the towns or to the colonies and foreign countries. The continuance of a judicious liberality offers the best guarantee against local scarcity of labour. The managers of the Union would speedily renew their attack if they had reason to believe that the demand at last exceeded the supply.

THE BEECHER SET.

MR. BEECHER has obtained an acquittal from the Committee of his congregation which was appointed at his own request to inquire into the charges against him, but there is no reason to suppose that this decision will put an end to a nasty controversy. We have no intention of going into the question of Mr. BEECHER's alleged misconduct. That is a matter which can be dealt with only by a regular judicial tribunal, armed with the necessary authority and acting on strict rules of evidence; and we gladly leave it to those whom it may concern. There is, however, one aspect of the subject which seems to come fairly under observation. It is well known that the great feature of Mr. BEECHER's preaching is the artistic cultivation of that sensationalism which has already a strong hold on American literature; and which is simply a sort of dram-drinking, and we are now able to estimate the effects of this unnatural excitement upon those who are subjected to it. It is perhaps significant of the nature of the admiration which Mr. BEECHER excites among his friends, that what seems chiefly to strike them in his defence is its artistic excellence. It is pronounced to be one of his most brilliant literary efforts; but those who consider the position in which he stands, and the charges hanging over him, might perhaps prefer a little less of the parade of literature on such an occasion. Much of it reads like passages from a novel. "I went forth," he says, "like a sleep-walker, while clouds were flying in the sky. There had been a snow-storm, which was breaking away. The winds were out, and whistling through the leafless trees, but all this was peace compared with my mood within." He gives a graphic account of his visit to Mrs. TILTON after her confession. "White as marble, with closed eyes as in a trance, and with her hands upon her breast," she reminded him of "some forms carved in marble that he had seen upon monuments in Europe." A large part of the defence consists of an analysis of the writer's moral nature. He is one, he says, upon whom trouble works inwardly, making him outwardly silent, but reverberating in the chambers of his soul; and when at length he does speak it is a pent-up flood. He also inherits a tendency to sadness and hypochondria, and in certain moods of reaction the world becomes black to him and he sees very despairingly. Yet outwardly, he says, he is full of overflowing spirit and gladness, and only those who are very intimate with him know of his gloom and despondency.

It will perhaps be thought that it would have been better if Mr. BEECHER had been content with simply denying the charges against him, and had left to others the analysis of his moral nature. Yet the style of the defence is eminently characteristic of the spirit which seems to have animated every one in this miserable affair. Here is a foul, unsavoury scandal, an open pool of corruption, as Mr. BEECHER himself justly calls it, and yet everybody seems to be anxious to stir it up and make as much of it as possible. The sum of Mr. BEECHER's statement is nothing more than a personal denial of the charges, which might have been compressed into a few plain straightforward sentences; but he saw his way to making a sensational display of his moral nature and sufferings, and the instinct was too strong to be resisted. He felt bound to make a thrilling story of it, something that would be talked about, and that would minister to the general craving for romantic excitement. The whole of the correspondence which has been published in connexion with this case shows the same morbid tendency to flatulent and hollow talk. In Mr. and Mrs. TILTON we see a couple of weak, commonplace creatures, gifted with a diseased literary fluency and fondness for big words, who are perpetually working themselves into a state of rhapsodical frenzy. They exchange hysterical letters, in which they exalt each other in the most absurd way, and affect to soar above mere ordinary humanity. TILTON

spins long gushing sermons about his feelings and aspirations and the state of his soul, and his wife responds in a similar strain. She lives, she says, "in profound wonder and hushed solemnity at this great mystery of soul-loving." BEECHER and TILTON, too, write in an equally pretentious and inflated way. BEECHER wishes it to be known by TILTON in confidence, but "not got into the papers," that the mainspring of his preaching is not natural gifts or secular ambition, but "God's own self working in me"; and TILTON writes to thank him for his "sweet and precious letter," and "the fair and winning thoughts of the other life" with which BEECHER is connected in "such a strange and beautiful way." There is no trace of simple, unaffected intimacy in the letters. They are all written in a sort of falsetto, and in a dialect as unlike that of everyday life as possible. The language of the affections is wrested for the purposes of religious communion, and something akin to fondling may be detected in the interchange of spiritual endearments. One of Mrs. TILTON's favourite themes is "the peculiar phase of CHRIST's character as a lover." Altogether the impression which one derives of the mental and moral condition of the different persons in this nauseous drama is anything but prepossessing. They seem to be all more or less infected with a sickly taint which finds expression in greasy cant and emotional delirium.

If the case against Mr. BEECHER had rested only on Mr. TILTON's accusations, it would have deserved little attention; and Mrs. TILTON's confession, which she afterwards retracted, might also have been explained away. TILTON appears to be a flighty, light-headed person, with a passion for notoriety, who is quite capable of being deluded by his own imagination, and whose honesty besides is open to some suspicion. Mr. BEECHER's most formidable accuser was in fact Mr. BEECHER himself, and his defence was therefore mainly directed to getting rid of what seemed to be the natural construction of his own admissions. He had written letters expressing the deepest sorrow, contrition, and remorse for something which he had done, and he had paid money, even at the cost of mortgaging his house, to the man who had threatened to expose him. "I had," he said, "to keep serene as if I was not alarmed or disturbed; to be cheerful at home and among friends, when I was suffering the torments of the damned; to pass sleepless nights often, and yet to come up fresh and full for Sunday." He had offered to face destruction in order to satisfy TILTON; to "step down and out," if that would do any good. Mr. BEECHER, however, now states that his penitential expressions had reference only to his having advised the proprietor of a newspaper which TILTON edited to dismiss him on account of his connexion with the Free Love movement, and to his having also counselled Mrs. TILTON to seek a divorce. He was deeply grieved when he saw the domestic misery which followed, and was anxious to make amends, and if possible to undo the mischief. He was also shocked to discover that, unconsciously on his part, he had acquired an influence over Mrs. TILTON which excited her husband's jealousy.

Perhaps, however, the most extraordinary part of the affair is the singular relations which appear to have existed between Mr. BEECHER and various persons connected with what is called "the scandal." It was on the 27th December, 1870, that Mr. TILTON sent Mr. BEECHER a card, calling upon him, for reasons which he was assumed to know, but which the writer forbore to state, to withdraw from the pulpit and quit Brooklyn as a residence; and it seems to have been immediately after this that Mr. BEECHER gave the advice which he soon afterwards regretted. It is scarcely possible to imagine a more serious charge against a minister of religion than that which TILTON made against BEECHER, and which was supported by a confession purporting to be written by his wife. Either the charge is true, or TILTON and MOULTON are a pair of infamous scoundrels. Yet Mr. BEECHER, after his first fit of anger, when he seems to have thought of assuming the aggressive towards his assailant, is full of Christian pity and forgiveness. After the charge was made he and TILTON continued to meet, to shake hands, and to talk "in a friendly way," and BEECHER even visited at TILTON's house. Mr. MOULTON stood over him with a pistol and compelled him to surrender Mrs. TILTON's retraction of her confession, and was continually bleeding him, as he now says, for hush-money for TILTON. Yet all this time MOULTON is treated as his dearest friend, dearer if possible than TILTON, for whom he is ready to sacrifice himself. MOULTON is "the friend whom God sent

me," and whose "hand tied up the storm that was ready to burst upon our heads." So the pastor writes to the wife of his accuser; yet "the storm," he now asserts, was nothing but a threat to publish an infamous falsehood. Is it not, he asks, an intimation of God's intent of mercy that three unhappy creatures such as ELIZABETH, THEODORE, and himself should have such a common friend as MOULTON? "Oh, that I could put in golden letters my deep sense of your faithful, earnest, undying fidelity—your disinterested friendship." Nevertheless MOULTON is now accused of participation in a wicked conspiracy. Again, he says of THEODORE, the man who (if we assume his innocence) had maligned him in the most horrible way, that if a reconciliation is to take place, "THEODORE will have the hardest task, but has he not proved himself capable of the noblest things?" He wonders whether ELIZABETH knows "how generously T. has carried himself towards me." He meets his slanderer in the cars, and remarks with servile gratitude, "He was kind; at the end he told me to go on with my work without the least anxiety in so far as his feelings and actions were the occasions of apprehension." It may seem to some almost an exaggeration of Christian meekness to thank a man for his kindness in refraining from publishing an abominable calumny. But Mr. BEECHER's gratitude knows no bounds. He mortgages his house and pays over 7,000 dollars to MOULTON for TILTON's benefit, and praises TILTON for his "generous impulses," though he admits that his "strong theatric nature" made it impossible to rely upon him. Thus the trivial incident of an accusation of adultery left this happy family as affectionate and united as ever. TILTON and his wife lived together as before, and the charitable pastor whose character had been assailed expresses his profound sense of the generosity with which he has been treated, and is willing to make any sacrifice in return for the imputations heaped upon him. This is certainly a puzzling and mysterious situation, but Mr. BEECHER's offer to retire from his church as a concession to the inventor of what he alleges to be a wicked libel is most bewildering of all. Many a man before now has succumbed to the terror of a false charge, and bribed his accuser. But Mr. BEECHER appears not only to have paid for silence, but to have assumed his own guilt in his intercourse with his persecutors. On his own construction of the matter, the moral cowardice which he has displayed in conniving at the villany of which he was himself the immediate victim is almost as great an offence against society as the personal misconduct with which he is charged.

That craving for perpetual excitement which is the besetting weakness of the American nature would seem to be accountable for much of the mischief in this case. It is evident from the letters which passed between Mrs. TILTON and her husband that she is a vain, weak, impulsive person, with a morbidly developed imagination. She had dreams of intellectual and spiritual communion with kindred spirits far above the ordinary level of humanity. Her husband's occupations took him a great deal away from home, and letter-writing, however ecstatic, is apt to be dull work. She wanted sympathy and mingling of soul with soul, and it appears to be Mr. BEECHER's practice to extend his ministrations to intimate social communion with his flock. He has described himself as being so familiar with the families of his congregation that he goes in and out amongst them just as if it were in his own house. Mrs. TILTON also presents us with an interesting sketch of the pastor, "in fine spirits, making calls." "He de-votes," she says, "Wednesdays and Thursdays to this work, till further notice; has three hundred to make; made twenty to-day; enjoys it immensely. He called on the WHITELOCKS to-day and kissed them all round, LIZZIE WOOD included, he said." In another letter she speaks of her cheek flushing with pleasure at the mention of his name or his arrival on a visit. Her delight and pleasure "in his friendship" was continually increasing, and she felt that she had "lived a richer and happier life" since she had known him. He brought flowers when he came, played with the children, discoursed on high matters with herself, and told her she exercised a most calming and peaceful influence on his nature. It must of course be a fine thing to move about in this way and to make oneself everywhere as much at home as if it were one's own house. A pastor who is not only "fresh and full" on Sundays, but who is always ready for a kiss or any bit of fun during the week, is likely to acquire a peculiar influence in the households of his congregation; but, as Mr. BEECHER

would perhaps now admit, all this is attended with some danger. The good man who feels like a father to everybody may be sure of himself, but he cannot answer for others, and in the course of the romping and kissing misunderstandings may arise. Mr. BEECHER pleads that he was not aware of the feelings with which Mrs. TILTON had come to regard him, and that he did nothing consciously to encourage them; but it is evident that relations of such delicacy as those which Mr. BEECHER has apparently endeavoured to maintain with his flock are extremely liable to misconstruction. There may be a charm in the freedom from prim clerical etiquette which prevails at Brooklyn, but it has its disadvantages, especially in a community where spiritual emotion is cultivated for its own sake at the expense of principle. It appears that Mrs. HOOKER, Mr. BEECHER's sister, who has adopted the doctrines of the Free Lovers, is disposed to believe the charges against him and accordingly to welcome him as the leader of a new woman's movement. She has proposed that he should ascend the Plymouth pulpit and read a confession which she has drawn up for the purpose, and then she will plead on his behalf. The invitation has not, however, been accepted. Altogether the circumstances out of which this scandal has arisen, and the manner in which it has been treated by the various persons concerned, are extremely bewildering. We seem to be in a world from which plain common sense is banished, and where the ordinary notions of propriety and decency are reversed.

SPAIN.

IT may be conjectured that dissatisfaction with the progress of active operations against the Carlists is in some degree connected with the Ministerial crisis which has just occurred at Madrid. Not only was the defeat of Estella a heavy blow, but it disclosed the weakness and want of organization of the army. Marshal CORTES's energy and his great reputation had inspired a confidence which seems not to have been justified by the resources at his command; and it would have been dangerous, or perhaps impossible, for his successors to continue the vigorous campaign which began with the relief of Bilbao. During the two months which have elapsed since the death of CORTES the balance of success has inclined to the side of the Carlists. They have entered several towns in different parts of Spain, though they have been for the most part unable to retain their acquisitions; and they have obtained possession, through the treachery of the garrison or the inhabitants, of the important fortress of Seo d'Urgel, with a considerable number of heavy guns and a quantity of stores. They now threaten Irun and Fontarabia, in the immediate neighbourhood of the French frontier, and they have once more blockaded Bilbao. Their insufficient provision of artillery has hitherto prevented them from taking by a regular siege any fortified town which was properly defended. They have been repelled in several attacks on Poyceda, which perhaps General LOPES DOMINGUEZ may finally succeed in relieving; but the movements of the national generals have hitherto been timid and ineffective, probably because they are unable to trust their undisciplined levies. According to the latest accounts General LOMA had received a check, and Marshal ZABALA had gone to Madrid, where his arrival has been followed by a change of Ministry. The Carlist army, which is now vaguely estimated at the number of 60,000 or 70,000 men, consists entirely of volunteers, though in some districts considerable pressure may have been used. The inhabitants of the Basque provinces and of Aragon belong to the most warlike part of the Spanish population; and a considerable part of the Carlist troops are really zealous in the questionable cause for which they are fighting. The Government of Madrid is compelled to rely on the system of conscription, which is probably more unpopular in Spain than in any other part of Europe. As purchase of exemption from compulsory service is allowed, the dislike of the conscripts for the service is aggravated by jealousy of the privileges of the more favoured class. Experience shows that in actual war good soldiers may be manufactured from the most unpromising materials, but as long as the army consists mainly of unwilling recruits fresh from their homes, it must form an unmanageable machine.

In the analogous war of the Vendée eighty years

ago, the forces of the central Government were, like the Spanish army, composed principally of recent levies, while few of the Royalists were professional soldiers; but it would be unjust to the supporters of either side in the French civil war to compare them with the Spanish combatants of the present day. The cause which the Bretons defended was more intelligible than the rights of Don CARLOS, and the Republican armies fought with the energy of genuine fanaticism. The American civil war furnished a more recent illustration of the comparative inefficiency of troops which had not been regularly trained. In courage and in patriotism the armies on both sides were unsurpassed, but all the earlier campaigns were indecisive; and it was only by an overwhelming preponderance of numbers and military resources that the Federal Government succeeded after five years in crushing the existence of the South. No war in ancient or modern times has been so costly, and the loss of life was enormous. Spain is neither so rich nor so liberal as the United States, and the frequent skirmishes which are reported are insignificant and bloodless in comparison with the great American battles. The prudence of the chiefs on both sides is perhaps excusable, but their aversion to encounter an equal enemy deprives the war of some of its interest. The hardships inflicted on the provinces which are the seat of war would probably be more intolerable if the country were further advanced in civilization. There are no manufactures to be interrupted; the contraband trade is probably facilitated; and agricultural operations proceed as in a state of peace. It may be conjectured that at a comparatively short distance from the scene of contest little interest is felt in the events of the war. Nine-tenths of the people of Spain are unable to read, and they have probably but an indistinct comprehension of even the broadest public interests. The populace of the towns, which has received a certain kind of political education from the speeches of demagogues, probably combines hatred and fear of the Carlists with a strong suspicion that the Government of Madrid, the generals of the army, and the whole body of official persons have a treasonable understanding with the enemy, or are engaged in plots for the restoration of the BOURBONS. It is, in fact, not unlikely that Don ALFONSO may profit in the end by the weariness of all parties, and by the antipathy of the officers of the army to the Republic. For the present Marshal SERRANO and his Ministers are fully employed in providing reinforcements and supplies for the army.

The readiest pecuniary recourse of a Spanish financier in difficulties is always some form of repudiation. The national creditors have again and again been induced or compelled to accept some more or less solid security instead of the interest due upon their bonds, which is required by the Government for more urgent payments. An operation of this kind was effected by consent only a few months ago; and, as a part of the arrangement, certain bills of purchasers of national property were appropriated to the bondholders, and lodged for their benefit in the Bank of England. Every formality which could be devised or applied, including the formal sanction of the Council of State, apparently secured the performance of the contract; but the present Finance Minister, Señor CAMACHO, declined to perform the obligations of his predecessors, and the complaisant Council of State approved of his withdrawal from the engagement. On inquiry it was found that the deposited bills had been removed from the Bank of England; and the unfortunate creditors are now coolly requested to enter into some new alternative arrangement. The sympathy which might be felt for defrauded bondholders is in some degree alleviated by the reflection that they are probably speculative purchasers of discredited securities. The price of a coupon bears a definite proportion to the confidence which is reposed in the national solvency and honour; and the probability that some Señor CAMACHO would administer the finances of Spain will have been anticipated and discounted by a judicious purchaser. The Spanish Government would perhaps be honest if it could, because an improved reputation would largely increase its facility of obtaining credit. Repudiation is a highly profitable operation if it can be practised once for all, but a debtor who is likely again to become a borrower injures himself as well as his creditor by refusing to pay. During the greater part of the reign of Queen ISABELLA, Spanish Bonds were excluded from the principal Stock Exchanges of Europe in consequence of the financial bad faith of the Government. The public creditor would now gladly recall the worst times of the Monarchy;

and he perhaps vaguely hopes that, if the Carlist war is ever terminated, a settled Government may attempt to revive the confidence which has been so long and so rudely disturbed.

Although the formal recognition of Marshal SERRANO'S Government has not yet been accomplished, Lord DERBY has judged rightly in not allowing the national policy to be affected by controversies between English capitalists and a foreign Government. It is now finally settled that a private lender is not to calculate on the intervention of his own Government as part of the security given by a foreign State. The same rule which prohibits the employment of fleets and armies to enforce the payment of private debts applies equally to measures of national policy. The recognition of the present Spanish Government can only be justified on the assumption that it is entitled to represent the nation. No process by which foreign creditors can be mulcted of their dues would in the smallest degree weaken any obedience which the Spaniards may be disposed to render to the Government of Madrid. The fact therefore on which alone the claim to recognition depends is not altered by the financial dishonesty of the Government. Cruel, tyrannical, and fraudulent Governments have frequently been admitted to diplomatic intercourse by Powers which were not disposed to regulate their policy by their moral estimation of their neighbours. The English Government ought to have recognized SERRANO'S Government without waiting for the decision of Germany; and it will not be deterred from completing the acknowledgment because Russia has unexpectedly refused to join in a harmless act of courtesy. The causes of the Russian hesitation have not been explained except by the conventional statement that the permanence of the Republic and its acceptance by the Spaniards themselves have not yet been sufficiently proved. It is hardly probable that the Emperor of Russia should object to the form of a Republic, which his father on several occasions ostentatiously preferred to that of a Constitutional Monarchy. Russia has often exchanged fulsome professions of respect and regard with the United States, and the Emperor's Government is represented at Paris. Whether the Government of Madrid will derive any advantage from the recognition of the other Powers remains to be proved. The French Legitimists will display additional zeal for the cause of Don CARLOS because the French Government has made advances to the Spanish Republic at the instigation of Germany. It is not known whether any measures have been adopted for diminishing the facilities which have hitherto been afforded to the Carlists at the frontier. The Government of Madrid is accused of scandalous negligence in delivering passports for France to the Carlist agents.

THE AMERICAN PRESIDENCY.

THE Republican Convention of Pennsylvania will probably find that it has made a blundering party move. The State has long boasted of its repeated success in deciding Presidential elections, and, although its proportional power has been diminished by the more rapid growth of population in the West, the authority of Pennsylvania is still respected by election managers throughout the Union. The local leaders apparently calculated that they would secure an advantage by being early in the field, and they have strictly conformed to the traditional rule of preferring an obscure candidate who may as little as possible provoke envy or jealousy. In a canvass prolonged through two years Mr. HARTMAN'S name may perhaps acquire the notoriety which is more indispensable than eminence or merit; but, if the Pennsylvanian candidate is accepted as unobjectionable, he will add no strength to the cause which he is selected to represent. In an old-fashioned contest between two organized factions professing definite and adverse political doctrines, it was sometimes the interest of the party which was opposed to the actual President to commence its canvass long before the expiration of the current term; but where the issues of the election are likely to be settled with reference to unforeseen events and to shifting opinions, there is some risk in anticipating the appointed period of the contest. In the present instance the promoters of the Pennsylvania Convention have published a challenge, not to their formidable opponents, but to the former nominees and favourites of themselves and their political allies. There may perhaps be sound reasons for adhering to the custom by which since the time of WASH-

INGTON Presidents have been restricted to two terms of office; but the Republican party will care more for success than for any constitutional tradition, and it is not improbable that General GRANT, who is known to desire a second re-election, may prove to be the most popular candidate who can be found. Electioneering politicians will not fail to consider the possibility that, if he is rejected by one party, General GRANT may take refuge in the opposite camp. He began life as a Democrat, and he is only a Republican by accident, because it suited the purpose of the majority for the time being to prefer a candidate whose military services had entitled him to the highest honours which the nation could bestow. During his tenure of the Presidency General GRANT has not scrupled to avail himself of the services of intriguing Republican politicians, and he has more than once inclined to the side of the coloured agitators in the Southern States. Of late it has been observed that he has held the balance more evenly; and if his claims to a third nomination are rejected by his former supporters, he may find his advantage in renewing his Democratic connexion.

An ostentatious denunciation of the Canadian Reciprocity Treaty, and of the general principles of Free-trade, seems to indicate that the manufacturers had contrived to obtain the control of the State Convention for the purpose of using its influence rather for their own private advantage than for the benefit of the party. It is perfectly intelligible that monopolists should prefer the maintenance of their own privileges to any political object; but it is less easy to explain their rejection of the candidature of General GRANT, who has hitherto consistently supported a protective tariff. The explanation of their distrust may perhaps be found in his veto on the Bill for the expansion of the currency. The President had, notwithstanding his want of economic training, laboriously arrived by his own unassisted acuteness at the conclusion that an early return to specie payments was desirable, and that it was not expedient by adulterating the currency to defraud creditors for the benefit of debtors. The Republican manufacturers may not unreasonably have suspected that a mind capable of attaining to one rational conclusion might eventually discover the fallacy of the whole theory of Protection. It may be presumed either that Mr. HARTMAN is interested in the maintenance of monopoly or that he is at least incapable of conviction. On many points of the dominant Republican creed there seems to be no reason for doubting the President's practical orthodoxy. He has uniformly discountenanced schemes for reforming the Civil Service, and many of his appointments have been made with a truly popular disregard of character and fitness. Nevertheless the Republican seceders are perhaps right in their suspicion that the President has rather conformed to the principles of the party than undergone a genuine conversion. Their wish to prevent his renomination is perfectly natural, but it is improbable that they can forecast at a distance of two years the conditions of a contest in which he might perhaps be the most available candidate.

The victory of the advocates of Free-trade is as certain as the date of their inevitable success is doubtful. If the supporters of the Reciprocity Treaty, and of a reduction in the tariff, ally themselves at the next election with the Democrats, they may probably be able to appoint a President. The interests of agricultural production and of commerce concern a vast majority of the inhabitants of the Union, while the protected manufacturers are comparatively few; and even in elections by universal suffrage there is sometimes an advantage in being in the right. Whether Free-trade will prevail in 1876, in 1880, or in 1884 it is impossible to foresee. A more urgent and still more important question will perhaps before the next election press for immediate solution. The most intelligent part of the community begins to repent of the precipitate legislation which is producing its necessary result in the spreading anarchy of the South. The forcible establishment of nominal and legal equality between an inferior and a superior race was from the first destined to prove abortive. Silly verbal quibbles about the superiority of the ballot to the bullet have not prevented resort to force, either when the coloured voters have won an election or when they have failed. In Louisiana, where a principal manager of the local Republican faction is an office-holder nearly connected with the President, the Federal troops have been employed on the side of the negroes and their political guides. In Arkansas, the President, having to choose between two rival Governors, preferred the competitor

who seems to have been legally elected. Grave disturbances have now broken out in Tennessee, where the coloured population was dissatisfied with the success of the white citizens in a State election. According to the latest accounts, negro insurgents had begun to drill and to collect arms, and the authorities had put to death several of the ringleaders. If the Southern States formed a separate community, at liberty, like the Spaniards, to settle their quarrels without external interference, the result of a war of races might be easily foretold. The whites are superior in numbers, in intelligence, and in power of organization; and they would inevitably prevail in a struggle with their former slaves. At present it is their interest to secure by moderation the support and approval of their Northern countrymen.

The Federal force may perhaps, notwithstanding its small numbers, be strong enough for a time to repress actual outbreaks, and to reduce civil war to a smouldering condition; but a thoroughly artificial and vicious state of political society will require organic remedies. If no previous revolution intervenes, both the contending parties in the South will tender their support to the candidate who will pledge himself most strongly to their respective claims. The Democratic party in the North will vote unanimously for the candidate who is favoured by the white population; but it seems probable that Republican opinion will be uncertain and divided. Against the restoration of slavery, and against systematic oppression of the coloured people, the respectable part of the Northern population would be unanimous; but the incapacity of the negroes to share in the government of the country is already acknowledged by all dispassionate observers. If the national prejudice against a politic restriction of the suffrage is found to be invincible, it will only remain to evade by some elaborate fiction the constitutional rights which it may be thought impossible openly to withdraw. In America, as in Europe, a tolerable licence necessarily leads to the establishment of some kind of dictatorial power; supreme executive authority can only be administered by the PRESIDENT, or in his name by the commander of a military force. If the South is to be governed arbitrarily for the benefit of its irreconcilable factions, General GRANT would probably maintain peace more effectually and more easily than a civilian who might be embarrassed by political prejudices. It is still remembered that at the close of the war he offered the Southern General terms so liberal that they were disavowed by the PRESIDENT. He must by this time have learned something of the art of government, of which he was originally ignorant; and he still retains a part of the popularity which was earned by his services in the war. While the disorders of the South require the exercise of all the statesmanlike vigour which may be found in the Union, it would be an inexcusable error to select an unknown candidate, such as Mr. HARTNETT, for the next Presidential term. General GRANT may perhaps, when the time of election arrives, profit by the remarkable absence of distinction among the politicians of the day.

POPULOUS PLACES.

IT is no doubt desirable that the Legislature in passing an Act should have a distinct idea of what it desires to do, and should take care that the idea is clearly conveyed in the language of the statute; and there is obviously a failure of duty when it shirks this obligation and throws upon others the responsibility of discovering or imagining what it may be supposed to have meant. At the same time, we cannot help thinking that perhaps rather more fuss is just now being made about the difficulty of defining "populous places" under the Licensing Act than is at all necessary. The Amendment Act was passed at the fag-end of the Session, when members were weary and time pressing, and when there was a disposition to evade rather than to take the trouble of surmounting any difficulties. It was foreseen that there might be some embarrassment in determining what was and what was not a populous place; but nobody could suggest any more convenient phrase, and it was thought to be rather a recommendation than otherwise that it left some discretion to the magistrates. It is enacted that 11 o'clock shall be the closing hour for public-houses in every town or populous place. There is no difficulty in ascertaining what is a town, for it is explained to be any urban sanitary district of one thousand inhabitants and upwards. A populous place, how-

ever, in its ordinary sense means only a place where there are people, and no hint is given as to how many people are required to make a place populous, except that there must be at least a thousand. All that the Act says is that a populous place shall mean any area with a population of not less than a thousand, which, by reason of the density of such population, the County Licensing Committee may by order determine to be a populous place. The duty of settling this question is therefore thrown upon the magistrates. It is possible that it might have been more convenient if the Legislature had fixed some general rule for the guidance of the local authorities, but of course a fixed rule would have deprived the magistrates of the discretion which it was supposed to be desirable that they should possess. We suspect that most persons, if they were asked to take a journey by railway, and to say whether the stations at which they stopped were populous places or not, would not have much difficulty in agreeing on the subject. A town has been defined by one of the Judges to be a place containing a number of houses congregated together—an inhabited spot where the occupation is continuous. It is true that this description would equally apply to a village, and that it affords no clue to the number of houses required as a qualification for the title of town. Yet it might, in conjunction with the condition that there must be at least a thousand inhabitants in order to constitute a populous place, be taken as a basis for a definition of that much abused expression. A populous place may be considered to be a collection of inhabited houses, not scattered at varying intervals over a large area, but all gathered together in a compact series of streets, so as to be a town, in fact, in everything except name. There are places with a thousand inhabitants which do not approach at all to the character of a town, because the population is loose and straggling. On the other hand, there are places which are only not towns because they do not possess the requisite urban sanitary organization.

There would seem to be a curious perversity in the action of some of the magistrates on this subject. There can be no doubt, we should say, that it was certainly not supposed by the Legislature that it would be impossible to discover any populous place in Buckinghamshire. Yet this is the conclusion at which the Licensing Committee of that county has arrived. If we turn to the *Gazetteer* we find that Chesham, Great Marlow, Wolverton, Amersham, Wendover, and other places have each a population of from 1,600 to 6,000, collected together in a close compact form, so that, in fact, they are practically towns, except that they have not the urban sanitary constitution. Two of these places are, in fact, the third and fourth most populous places in the county. It is absurd that such places should not be treated as towns as regards the hours at which public-houses should be closed. Their social circumstances are the same as those of a town, their wants are the same, and, if it is right that towns which are practically towns should have their public-houses open till 11 o'clock at night, it is only reasonable that these other places should also be under the same rule. The consequence of this decision will be, as has been pointed out, that the closing hour in towns of 1,200 or 1,500 people will be 11 o'clock, while in places of 5,000 or 6,000 inhabitants it will be 10 o'clock. It will be observed that the point to be determined is not merely the extent of population in a place, but its density, and those who are now calling out for a hard and fast definition would be usefully employed if they would exercise their ingenuity in endeavouring to devise one. It might perhaps be done by requiring a certain proportion of inhabitants to every acre; but it is not at all unlikely that a definition, if attempted very closely, might give rise to at least as many difficulties as the want of one. All that would seem to be required is a little common sense on the part of magistrates, and willingness to give effect to the obvious intentions of the Legislature. A "Somersetshire Magistrate" who has written a very sensible letter on the subject has pointed out that the natural way to distinguish a populous place from a scattered rural district is to observe whether it is furnished with a common supply of gas or water, and the ordinary appliances of an urban community. These matters may be ascertained, and a reasonable deduction drawn from them, without requiring any superhuman sagacity on the part of gentlemen who are not usually supposed to possess it. Magistrates who are anxious to give effect to the law will find that they have a comparatively simple task before them; but of course there are none so blind as those who

will not see a populous place of 5,000 inhabitants. In Dorsetshire the Licensing Committee has resolved to hold an adjourned meeting for the purpose of receiving applications from districts whose inhabitants desire them to be defined as populous places; and if they can show that their social condition is similar to that of towns where public-houses are open till 11 o'clock, they will probably get what they want. A question has been raised as to whether the Licensing Committees are bound to fix the boundaries of populous places on the 1st of September or have power to adjourn; but there can hardly be any doubt that, whatever ambiguity there may be in the law, the Judges would recognize the right of adjournment within reasonable limits.

There is another matter connected with the liquor laws in which the Legislature has endeavoured to evade the responsibility of explaining its own meaning in a distinct and definite manner, and that is in the case of the celebrated *bonâ fide* traveller. A publican who has a house near Finsbury Park was brought before the police magistrate the other day for selling intoxicating drink at unlawful hours. It appears that a great many thirsty people find their way to the defendant's house on Sunday during the hours when public-houses are closed, and obtain drink in the character of travellers. This was the first case under the new Licensing Act, which leaves it, in the first instance, to the discretion of the landlord to decide whether or not he will believe the statement of the person alleging himself to be a traveller; and, in the second place, to the discretion of the magistrate to say whether the publican really did believe what he was told. It will be seen that there is a good deal of margin for discretion here pretty well all round, and it must be very difficult for a magistrate to know whether a publican believes what his customers say, as well as for the publican to know what he ought to believe. It is obvious that, except in the case of persons who are actually known to him, the landlord has no possible means of ascertaining where his customers come from. There are many persons who like to take a walk to Finsbury Park on a Sunday morning, and if the weather is hot they will naturally be thirsty. On the Sunday in question 1,320 persons were admitted to this public-house, and they were each asked whether they were travellers, and replied that they were. The magistrate remarked that it was most improper to admit hundreds of persons in this way; but it is evident that a publican must take each case individually, and that, if the number accumulates, that is not his fault. A thousand *bonâ fide* travellers have just as much right to demand refreshment as a couple; the only question is whether the applicants properly come under the designation of travellers. The magistrate told the landlord that he was bound to take reasonable precautions; but when he was asked to say what were reasonable precautions, he replied that he would rather not express any opinion on the subject. Unfortunately his caution broke down here, and he went on to observe that he thought a publican would not have much difficulty in discovering whether an applicant was entitled to admission. It is perfectly obvious, however, that a publican must have the greatest possible difficulty in ascertaining where a man whom he never before saw in his life usually lives, and whether he is telling the truth as to his residence; and it is not easy to see what more he can do in such a case than ask the usual questions and take the answers on trust.

THE PILGRIMAGE TO PONTIGNY.

WE have heard the case put, whether, if crusades were still in fashion, Messrs. Cook and Son would offer "personally to conduct" them. Perhaps however in those days their offers would have been rejected, at all events by the first batch of zealots who set forth, unconscious of policy, in honest and ignorant faith. A system of tickets, coupons, and such like would have seemed of the earth, earthly, to those who committed themselves to the divine guidance of a goat and a goose, or to the honest man who set out in his cart and asked at each town which he came to whether that was Jerusalem. But if Messrs. Cook and Son have not in these times the chance of "personally conducting" a crusade, they can at least, by something like the lawyers' doctrine of *cy pres*, conduct the next thing to a crusade—namely, a pilgrimage. A crusade is, in short, a pilgrimage with fighting thrown in; and in the land of Moab at least, Mr. Cook's pilgrims seem, if they do not come in for actual fighting, at any rate to pay some kind of black mail which may pass for a payment to avoid fighting, a kind of scutage paid to the enemy. It would seem then that in the more distant expeditions of Messrs. Cook a touch of the crusading element really

is added, and perhaps if there ever should be a crusade to restore the temporal power of the Holy See, Messrs. Cook will undertake "personally to conduct" the pious warriors by land or by sea, as the Venetians conducted the heroes of the Fourth Crusade. The next time that any exploit happens of the nature of the taking of Zara, it may be that holders of coupons will be entitled to free quarters in the conquered city. But till there is a chance of conducting a real crusade, it is something to be able to conduct a real pilgrimage. And perhaps it might be better if all pilgrimages could be put into the hands of Messrs. Cook, for we are sure that under their guidance the pilgrims would not be allowed to behave so badly as some of the order are said to have done lately in Canterbury Cathedral. But, while we are writing, Messrs. Cook's last set of pilgrims are on their way to a shrine more distant than Canterbury, though nearer than Moab. If all the world has not heard of the pilgrimage to Pontigny, it is not the fault of Archbishop Manning, nor of the *Times* and its Correspondents. But why do they go to Pontigny? They go, it seems, to do reverence to St. Edmund of Canterbury, who is there buried, though it would seem from one correspondent that the whole of him has not been allowed to stay quietly in his grave. But if we ask why they should go to do reverence to St. Edmund the question becomes a little darker. It is really amusing to read the letters of Archbishop Manning, all the more amusing because on some important points he has really got hold of English history by the right end. But he is bound somehow to force the facts of English history into some kind of agreement with the theories of Ultramontaniam, and to believe that all the ecclesiastical worthies of mediæval England stood in the same kind of relation to the Pope in which he stands himself. Now we have often pointed out the general difference between the position of men who accepted a doctrine which it had not come into their heads to doubt and of men who accept the same doctrine in the teeth of doubts and controversies of all kinds. Even if it could be proved that St. Edmund thought exactly about the supremacy of the Pope as Archbishop Manning thinks, he would still have held the doctrine in quite another way. But nothing can be plainer than that we really have no need to draw this distinction, because nothing is plainer than that Edmund Rich was not, as Archbishop Manning gives him out, a zealous supporter of the supremacy of Rome, but rather as strong an opponent of it as a very gentle and rather timid nature would let him be. It is amusing to compare Dr. Manning's notion of St. Edmund with Dr. Hook's, who of course works as hard as he can to put St. Edmund in an exactly opposite point of view. The true picture no doubt lies somewhere between the two, but there can be no doubt that Edmund Rich, St. Edmund the Archbishop, who withstood both Pope and King and suffered at the hands of both Pope and King, though his resistance was not so fierce nor his sufferings so hard as those of some other ecclesiastical heroes, is entitled to a place, not among those who served Rome against England, but among those who stood up for England against Rome.

In short, Dr. Manning and his followers have hit on the wrong Archbishop and the wrong place of pilgrimage. Instead of going to Pontigny to reverence Edmund Rich, they should go to St. Gemma to reverence his predecessor Richard. To be sure the journey would be longer. St. Gemma is only two days' journey on this side Rome, according to the day's journeys of the thirteenth century, and it is not so easy to find on the map as Pontigny. But we doubt not that the energy of Messrs. Cook would easily get up a pilgrimage to St. Gemma, and, at any rate, as it is north of Rome and not south, it can hardly be such dangerous travelling there as it seems still to be in the land of Moab. As Archbishop Richard was buried at St. Gemma, he is most likely there still. And as his body wrought at least one miracle after death, it seems hard that he has been left all this time without even so much as a B to put before his name. Richard wrote some books as well as Edmund, and he was a much more faithful servant of the Holy See. For his chief exploit was to go to Rome to complain of the King and the King's Minister; and it is not wonderful that Gregory the Ninth listened with all favour to an English Archbishop who came on such an errand. Edmund went to Rome also, but he went to complain of the way in which the Papal Legate interfered with and thwarted all his own plans of reform, and of course he got very little comfort from Gregory. Edmund, in short, through the whole of his not very long archiepiscopate, had, as became a good Englishman in the reign of Henry the Third, Pope and King together always against him. Dr. Manning tells us that it was "in defence of the laws and liberties of the Catholic Church" that St. Edmund "died in exile." There is a sense in which these words are true, but they are not true in the sense which they will doubtless convey to Dr. Manning's readers and hearers. If by the laws and liberties of the Catholic Church we mean the common rights of the Church of England and of any other national Church as against the usurpations of the See of Rome, for such laws and liberties St. Edmund certainly did strive. And, if a man who goes abroad of his own act is said to be in exile, St. Edmund certainly died in exile. From Dr. Manning's description anybody would think that Edmund was a fierce asserter of ecclesiastical rights against the King rather than against the Pope, and that it was by the King's act that he was banished. But in truth Edmund had no quarrel with the King, save in so far as the King backed up the Pope in aggressions against the Church and realm of England.

In fact, at this stage Robert Grosseteste seems to have thought his metropolitan rather slack in asserting ecclesiastical privileges of any kind. Robert was strong against the clergy hold-

ing secular offices as well as being subject to secular courts. Edmund thought it better to tolerate pluralities and the holding of secular offices by churchmen, rather than forbid abuses with a reservation of the Pope's power to allow them, a power which was certain to be exercised in the very cases where the abuse was greatest. It was better of the two that a plurality of benefices should be held by Englishmen, who might perhaps discharge the duties of some of them, than by Italians who would certainly never come near any of them. The strife of that day was not like any of the strifes earlier or later, and it was in some points a more healthy strife than any of them. King and Pope were leagued together against the clergy and people of England: both alike were eager to seize their money and to promote foreigners at their expense. Edmund censured Simon of Montfort for his uncanonical marriage, but the strife in which Edmund was engaged was the same strife in which Simon was engaged thirty years later; the wonder is that Edmund was ever canonized at Rome. There is no doubt that the honour was granted most unwillingly; but as Edmund did not die under any ecclesiastical censure, and as his life had been a model of saintship according to the standard of those times, the honour could be granted without actual inconsistency. It was wrong from Innocent the Fourth by the general demand of England, and, if we like to believe the story, it was further wrong from him by finding in his own person that the patriotic Englishman had miraculous powers of healing. So, we all know, had Simon, but then they were not exercised for the healing of a Bishop of Rome. But the canonization of Edmund was in the end politic. We see by this present pilgrimage that it has answered. Had Edmund died excommunicate like Simon, not only would Dr. Manning never have thought of sending a pilgrimage to his grave, but the men of his own time would, as in the case of Simon, have been better able to see in him the champion of England against Rome. The canonization blinded men's eyes. Edmund became a champion of the Church in the more convenient sense of the word Church, and now he is held up to reverence as a supporter of the usurpations which he passed his primacy in withstanding. At the same time we must allow that Edmund himself did give a certain handle to this kind of treatment; he did in a manner give occasion for the enemy to blaspheme. Would people go on pilgrimage to him if his tomb were to be found in any of his English haunts, at Abingdon, at Coler, at Salisbury, or at Canterbury? We know not. There was a weakness in Edmund's retiring from his duties to any place, especially to a place beyond sea. But his choice of Pontigny made it specially easy to turn him into a saint of the common type. Edmund no doubt went to Pontigny because Thomas had gone there. The two men were utterly unlike, though it is almost as unfair to claim Thomas as it is to claim Edmund as a mere advocate of the Roman supremacy. Still, in character and position and in the cause in which each strove, Thomas and Edmund held quite different historical positions. But Edmund's own act certainly did a good deal to confound the two. By Edmund's time Thomas had become the received type of a saintly archbishop. What Thomas had done was therefore the right thing for Edmund to do. Thomas had gone to Pontigny; therefore, when Edmund found that he got small comfort at Canterbury, and would certainly get less comfort at Rome, he went to Pontigny too. By so doing he gave a great handle towards mixing up two careers which were in truth quite unlike one another.

It is of some importance that the true position of Archbishop Edmund should be cleared up. Englishmen should not let the enemy rob them of all their worthies. Archbishop Manning of course speaks from his own point of view, and we do not blame him. But there was the *Times* a few days ago talking away—we forget the exact words—about Edmund being ever to spend “national property” and “national” something else on behalf of a foreign power. Seeing that what Edmund really did was to try to hinder a foreign power from seizing English money, this is hardly an answer to gainsayers. Archbishop Manning must indeed chuckle when he reads this kind of thing, and we do not know that churchmen are much mended when some well-meaning man sends to the *Times* an extract about St. Edmund from some modern compilation, in which he is grotesquely spoken of as “a Berkshire clergyman.” Dr. Hook gives the facts, but he of course as naturally colours one way as Dr. Manning colours the other. Still Roger of Wendover and Mathew Paris are to be had, and we rather think that Mr. Bohn has published a crib of them, for the benefit, it may be, of pilgrims and writers in the *Times*. At all events, though we do not claim to put Edmund on a level with Stephen Langton and Earl Simon, we do claim him in his degree as an English patriot and an opponent of Rome. The Ultramontane who goes to Pontigny in the belief that he is going to worship at the tomb of one who would have had any sympathy with himself may undoubtedly be reckoned in the number of those who worship they know not what.

THE ART OF SKIPPING.

CONSIDERING how much more people read, or are supposed to read, nowadays than they ever did before, it is not a little strange how seldom they are aware that there is room for the exercise of art in reading as well as in other occupations. The remark which Socrates made on statesmanship, that it was an exceedingly difficult and complicated business which everybody practised, and nobody thought himself bound to learn, applies with tenfold

force in our own day, not merely to its original object, but to an infinity of other matters. And the exercise of reading, in which many of us spend, whether for work or for pleasure, a very appreciable proportion of our lives, certainly falls within the spirit of his censure. We learn in our infancy to read words, but we are left to pick up the way to read books. Advice about the choice of the kind of matter to be read is indeed plentiful enough, and is not unfrequently overdone; but how to read the things chosen intelligently and economically, how to extract the greatest profit with the least expense of time and eyesight—this, which surely is a thing worth knowing, is left for the most part to come by nature. So far as we are aware, there is only one current precept on the subject, and that is radically wrong. As the prejudice created by it must be cleared away before any reasonable conclusions of a positive kind can be arrived at, we shall do our best to expose the venerable fallacy at the risk of being held to encourage idleness, desultoriness, and naughtiness generally.

Almost every one who was fond of reading as a child must more or less distinctly remember having impressed on him at various times that “it is wrong to skip.” This maxim is answerable for a quantity of time and trouble wasted in useless reading by the children who listen to it, after they have come to riper years, which, if the statistics could only be collected and nicely made out, should be enough to raise a clamour for a Royal Commission. The general proposition is indeed softened by explanations and qualifications, by the time when young readers are thought to be of sufficient discretion to follow them. But the qualifications are all wrong too. The rule commonly taught, as modified by exceptions in teaching or practice, comes to this. It is wrong to skip in reading a solid book. The more solid the book, and the more important the matter, the greater is the offence of skipping. It is venial to skip in reading poetry, and quite harmless to skip in reading novels. This rule appears to us just as wise and sensible as if a parent whose son was about to travel partly on business in cities, partly in the country, and partly among works of art, were to advise him in this fashion:—“I would have you above all things remember to keep a most observant eye on everything about you in the places where you do business. If you confine your attention to what concerns yourself, if you cannot tell me what other people were doing, if you fail to note all the things in the counting-houses and the shop-windows, I shall take you for an idle fellow. As to the country, no doubt you had better observe its beauties than not, but it does not much matter. As to pictures and so forth, certainly they are good in their way; but as they are only made to be looked at, why you may look at them just as carefully or carelessly as you please.”

Instead of acting by analogy to such advice as this, which we need not spend time in showing to be counter to the general opinion and habits of mankind, we prefer to treat reading as a branch of human life, and to hold a doctrine directly opposed to the popular fallacy. We maintain that the true belief as to skipping is to this effect—generally speaking, *it is not wrong to skip*. Skipping is an important part of the art of reading, and should be practised systematically. It is most to be practised in solid books—by which we mean, for the purposes of this discussion, books that are read merely for information. Solid or serious reading consists in attending to the matter of a book independently of the form, except indeed when the form itself is the primary subject of study, as for instance from the point of view of a philologist or historian of literature. The more solid the book, the more expedient it is to skip, and the more useful it is to know how to skip judiciously. But when the form is of sensible importance to the reader as compared with the matter—or, in less abstract language, when a book is read partly or wholly for entertainment and æsthetic pleasure, independently of information—then the art of skipping is no longer in its proper place, and should be very sparingly used, if at all. It is generally a mistake in poetry, and it is absolutely wrong in a good novel. We do not mean to forbid a cursory glance at a novel or volume of poems about which nothing is known, honestly intended as a preliminary inquiry to ascertain whether it is worth reading at all. One has a perfect right to look into a book and say that it appears to be worth reading or not worth reading as the case may be; and the faculty of doing this with a reasonable chance of guessing right is indeed closely connected with the art and mystery of skipping. But we must protest against the habit of tasting a good novel by dips and skips—which really is nothing better than taking extracts at random—and then pretending to have read the novel. This way of treating the masterpieces of fiction, though we fear it is not uncommon and meets with but little reprehension, we take to be no less vicious and demoralizing than the much decried practice of skipping in books of solid instruction is in truth wholesome and laudable. The same observation applies, though in a less degree, to the reading of poems.

Our position may seem paradoxical, but it can be established by indisputable steps. Let us begin at the beginning with the extreme of serious literature. The books which are wholly made up of solid instruction, or profess so to be, which are completely free, so far as human frailty will allow, from any suspicion of art or amusement, are Charles Lamb's class of *bibliothèque* books, which are no books. The class includes nearly all dictionaries—not quite all, for M. Littré, and perhaps a few others, have a way of writing a series of disjointed but fascinating essays disguised in the dictionary form—most encyclopædic literature, of

course with individual exceptions, and a considerable part of books of reference and scientific treatises generally. Now it may be safely said that no one ever supposed that such books were meant to be read continuously, that there was *any* virtue in reading them from beginning to end, or any vice in looking into them to find particular things as wanted. Indeed it is generally admitted that the worker in any special subject on which much literature exists is at a disadvantage if he does not know how to use books of reference properly—that is, if he is not an adept in the art of skipping. This is especially true in the profession which of all others is the most rigorous in requiring accurate knowledge and the least favourable to slovenly habits. Half the practical aptitude of a lawyer, at any rate of an English lawyer, depends on his being able to use his books discontinuously, so as to pick out the very thing he is in search of, and not waste time on its irrelevant surroundings.

But if thus much is conceded, why should the principle of skipping be confined to books which are manifestly and on the face of them not readable? Why is it right to flit from page to page of a dictionary by the help of the alphabetical order, and wrong to travel from one part of a history or a book of travels to another by the help of the index (if the book happens to be tolerably indexed), table of contents, or otherwise? We can see no answer to this, so long as the object of reading the book is knowledge and not artistic pleasure. The writer can at most only guess what things it will be convenient to tell; an intelligent reader must know best what things he wants to be told. It is the same with argumentative writing, essays, and the like. You see by a glance at the first page of half-a-dozen that the whole space is filled with setting forth an argument with which you are quite familiar, to which you will never be converted, or to which you need no conversion; by what manner of duty or reason can you be bound to read the other five pages? It may be answered, Because the style gives a new lustre to old matter. But then you are no longer reading with the single view of information, and the instance is no exception to the first branch of our rule, but a confirmation of the second. It shows, not that it is wrong to skip when you read for learning, but that it is right not to skip when you read for pleasure.

In reading what may be called literature of exposition, especially in really good essays, it is often difficult to say how much of the general pleasurable impression is due to the substance of the author's meaning, and how much to the form. This may be regarded as a kind of neutral ground, where skipping may in some circumstances be allowable and expedient, in others a grave mistake. When we come to fiction the case is much plainer. A good work of fiction, whether in prose or in verse—we are here speaking only of good works—is a work of art, and can be rightly enjoyed only by entering into sympathy with the artist's mind and accepting his work according to his intention. In a perfect poem the place of every word, in a perfect novel the place, if not of every word, of every episode and of every paragraph, is important; and the reader who skips throws away the pleasure he was meant to derive from the harmony of composition, in which very possibly the beauty of the whole may chiefly consist, and despises the best part of the artist's labour. He might as well go to see a good play, and then wilfully miss every alternate scene. In saying this we are no doubt setting up a high standard of light reading. We assert by implication the doctrine, which many will think severe, that a novel not worth reading continuously is not worth reading at all; and this principle would lead to the conclusion that a vast quantity of current and accepted literature has no business to exist. And so we are perhaps committed to a paradox worse than the first. We should not be disinclined to do battle for it if space allowed; but the whole subject of novel-reading is too large to be disposed of in a closing sentence, and one paradox at a time is enough.

FATHER THEINER.

THE death of Father Theiner deprives the Church of Rome of one of her most conspicuous members, and closes a strange career. He was born in Silesia, in 1804, and in his youth belonged to a group of men whose attachment to the Catholic Church was uncertain, and who lived at open war with her laws and authorities. For a whole generation the temper of the Silesian clergy has been exceptional. One Prince Bishop became a Protestant; another was long renowned as the most independent and enlightened prelate of his time; a third was involved during his early years in the same contentions as Theiner. The Theological Faculty of Breslau was continually in hot water, and Bishop Reinkeus is one of its Professors. Father Theiner's first work, a treatise on the law of Celibacy, was written in conjunction with his elder brother Anton, who was an active assailant of Rome and died out of communion with the Church. At that time Theiner was extremely young, and he afterwards avowed that the views put forward in his book were suggested by other influences than sincere religious zeal. Towards Protestantism indeed he had no inclination, and during this phase of his opinions England in particular inspired him with a grotesque aversion. When he left his country at the age of twenty-seven he was loosely and imperfectly trained. He possessed neither deep convictions nor high aspirations, and he showed little promise of future distinction beyond the common inheritance of his race—the power of patient, obscure, and thankless toil. His travels were first directed to the

collection of materials for the early history of the Canon Law. At Paris he made the acquaintance both of Guizot and of Lamennais, but neither of the two hostile teachers claimed any influence over his unsettled mind. In 1832 he came to Rome, went through a course of religious exercises at St. Eusebio, and came out from them a fervent Catholic. But the shadows of his early experience darkened the remainder of his life. The sense of scandal to be atoned for, and of evil to be made good, remained with him to the end. If it operated as a restraint and an impediment to action, it also served as an encouragement to tranquil endurance under trials and humiliations which a more refined character would have found hard to bear. When he became an important personage his enemies affirmed that there was better reason for his repugnance than he cared to admit. They related that he had made himself so useful to the French Government by his reports on the schemes of the Legationist clergy in 1832, that they sent him on a similar errand to Rome, and that there, after his conversion, he betrayed his employers to Cardinal Bernetti.

Theiner repaid the friendship of the Jesuits by an enthusiastic admiration, and even thought of joining them. It is said that they were unwilling to admit him, but that they made him very advantageous offers to write their history. The commission was ultimately given to Grégoire Joly, and the change was a judicious one. Theiner's book would have been less readable without being more solid. Although he was able to write in four languages, in all of them he was confused and declamatory. He knew how to pile quotation upon quotation with the external erudition of the seventeenth century, but he had not learnt to defend an argument without triviality or to assail one without violence. He complained that translators, with an excess of delicacy, omitted the telling passages of his books. Sometimes he himself saw reason, in second editions, to prune the coarse exuberance of the first. No man of equal mark in letters, excepting Ewald, has ever wanted so completely the note of good breeding. No wealth of material could redeem his defects of method, of temper, and of taste. But readers who were repelled by the tone of his ungainly volumes on the Swedish Reformation, the ecclesiastical policy of Frederick the Great, or the conversion of German princes, could not help admitting that the author had been fortunate in his opportunities, and was working a vein of the richest ore. For fifteen years his writings met with no applause, and his position in literature was hardly recognized, but it was known that he could handle a pickaxe better than any workman in Rome. Theiner turned, like Newman after him, from the Jesuits to the Oratorians. In the spacious and quiet convent of the Chiesa Nuova he found a splendid library, a goodly store of manuscripts, and the papers of Raynaldus, the continuator of Baronius. Before the death of Gregory XVI. he was admitted into the Papal archives, and after the revolution he was placed over them.

It was an attractive plan to employ Germans in departments where there was most to apprehend from Germany, and the experiment was afterwards tried over again in the persons of Heitsch and Schneider. It was supposed that the presence at the Vatican of a man steeped in the secrets of the Prussian schools would embolden Roman evolutions to deal with the pretentious science of Göttingen and Tübingen. The countrymen of the new Prefect complained bitterly of his disregard for the claims of patriotism. He was not corrupt like the traditional guardians of southern collections, and he had not the pleasant plausibility with which they at once lead on and baffle the inquisitive traveller. Theiner had been placed there to drive others away, and for many years he did his work with signal success. He knew the value of the treasures given into his charge, and he wished to keep them for himself. It was the right place for him, and he made the most of it. As a purveyor of the raw materials from which histories are woven he holds the highest place, and surpasses even such men as Mühlton and Muratori. Beside many smaller works, he produced in ten years fifteen folios, four-fifths of which consisted of entirely new matter. They relate chiefly to countries lying outside the great central current of European history, and the attention he bestowed on Poland, Hungary, and Croatia might have been more usefully directed to France, Spain, and the Reformation. The best of his publications perhaps is the *Codex Diplomaticus* of the Temporal Power; the most careless is the volume on Iceland. His eagerness to avail himself of his incomparable advantages and of his boundless material made him too hasty in the process of selection and preparation. Compared with another German who held a similar position in the Vatican, Holstenius, his inferiority is apparent. But, though not a first-rate editor, his work is not worse done than that of the French Benedictines, such as Montfaucon, or than that of Cardinal Mai, or than some of the earlier and later volumes of the German *Monumenta*. It will be felt hereafter how fortunate it was that the last Prefect of the Secret Archives should have been so quick and so profuse in printing them. Theiner himself found that the collection had been tampered with, and there is too much reason to fear that before the Papal manuscripts are made public the gaps will have multiplied. For exact scholarship his studies had not prepared him. His early training fell in pre-historic times, and he left Germany before the critical accuracy of Hermann and Bekker had been extended from classical literature to the general purposes of history. From the age of thirty he studied in the worst of all schools, and was the colleague of a man notorious as a composer of texts. He had not sufficient youth or flexibility or freedom to keep pace with the progress of historical science, and in his later years his relation towards its masters was as that of Gillies to Grote, or of Hallam and Palgrave to Stubbs and Freeman. In

estimating his success and failure, it must be remembered that, as an officer of the Papal palace, he held a position of great dependence, and was subject to the control of rigid censors. The highest interests might be compromised by works issuing from that tower which overtops the Braccio Nuovo and commands the garden of the Belvedere. Whatever he published came forth under the special sanction of the Pope. The favour, and even confidence, which Theiner at one time enjoyed placed him under still stricter obligations. It was inevitable that his books should become discredited by the omission of documents and parts of documents from the fear of giving offence. In his volume on English history, for example, he gives no letters from Campeggio during the winter of 1528-9—during the critical time, that is to say, of the illness of Clement and of the burning of the secret Brevé. Yet a full diary of the proceedings was amongst the papers before him. Hardly any student of Theiner's works will venture to affirm that these restrictions on free and honest speech were altogether repugnant to his nature. A quarter of a century spent amongst the records of Papal policy and action during seven hundred years had strongly impressed him with awe of a power exercised with so much vigour, with such continuous adherence to the same maxims, and for the most part with so much devotion to spiritual and ideal aims. No other man had seen these things so closely, or had been so much exposed to an influence which must be intelligible to every one who has read the epistles of Gregory the Great or the yet more imposing correspondence of Innocent III. Theiner seemed to feel that the evil that Popes have done lives after them and need not be dwelt on, while the good is oft interred with their bones and needs to be drawn forth again into the light of day. He speaks with veneration of Clement XIV., though he knew that he had won his election by promising to suppress the Jesuits; and in three folio volumes occupied with the life of Gregory XIII. not a word escapes him which would show that he was aware of the extraordinary infamy of his hero.

Most of Theiner's work was executed by the easy process of copying what was in his custody. But he was engaged for many years on a far more serious task. At the close of the Council of Trent the decrees were published, and Massarelli, who had acted as secretary from the beginning to the end, was charged to prepare a report of all the proceedings from day to day. But when the work was done, and before it received the last touches, the idea of publication was abandoned and the MS. was locked up in the Castle of St. Angelo. In 1857 Theiner obtained leave to publish it. He made diligent search at Rome, at Naples, and at Florence for those other sources of information from which Pallavicini had supplied the deficiencies of the jejune and reticent diary. He announced a vast collection in seven volumes, and, in the hope perhaps of dissuading opposition, he gave out that the credibility of the Jesuit historian would be signally vindicated. A part of the work had been printed when the approach of the Vatican Council made it desirable to suspend its further progress. Early in 1869 a few sheets were placed in the hands of trusted officials. They contained the Secretary's account of the standing orders of the Council, of the mode of conducting the debates, and of the regulations relating to freedom of discussion. When it was found in the following winter that the Austrian bishops who objected to the new regulations had the old ones in their hands to appeal to, it was at once declared that Theiner had betrayed to the Pope's enemies that which it was his special duty to suppress, and he was required to resign the keys of the Secret Archives. In reality this charge was only a pretext. The printed fragment of Massarelli contained little or nothing that was new. Copies were known to exist in several European libraries; the substance might be found in the very first pages of a work two centuries old with which every theologian is familiar; and the most pointed and significant passage had been recently made public by an Italian priest.

The storm which burst upon Theiner in the spring of 1870 had been brewing for twenty years. In a city as remarkable for enviousness as for urbanity, his position as a foreigner and the personal benefit he derived from his familiarity with treasures from which all others were excluded were enough to make him enemies. During the Liberal era, when the Jesuits were much in his way, Pius IX. had encouraged Theiner to justify the Pope who suppressed them. Although the documents relating to that most important year, 1773, had been excluded, his *Life of Clement XIV.* contained much in the matter, and still more in the spirit, which was offensive to the Society, and their best preacher, Ravignan, won his spurs in literature by preparing a reply to it. Some years later Theiner furnished a rival order with the means of casting grave reproach on the Jesuit missions in China. He allowed his own countryman, Laemmer, to compile a whole volume out of the forbidden treasures in his keeping. He published two volumes full of Bonapartist enthusiasm in order to weaken the impression made by the great work in which D'Haussonville has exhibited the policy of Napoleon against Pius VII. It was assumed that he had done this for a reward, and it was asserted that, under the same inducement, he had trusted papers which he ought to have held sacred to indiscreet and wealthy Protestants, and even to Anglican bishops; that, regardless of excommunication, he had introduced foreigners within the sacred precincts of the Archives, and that he had supplied Rauscher with books to compose his anti-Papal pamphlets. Above all, it was notorious that, as soon as the old disputes put off their disguise, and were definitely reduced to the fundamental choice between acceptance and repudiation of

the Jesuit system, Theiner, in spite of many concessions, and of much doubt and indifference in particulars, was at heart an enemy. He made some efforts to vindicate himself, and to prove his thorough compliance with the letter of the new law. But there was no denying that, after dedicating one book to the Pope, he had dedicated another to Hohenlohe, and a third to Strossmayer, that he lived on intimate terms with Friedrich, and that he counted Döllinger among his friends. It is certain that in a pontificate controlled by Jesuits Theiner's place was not at the Vatican. He must have felt that he was a meat sacrifice to the altered spirit of the time. His consciousness of how his fate had been incurred gave to his bearing under misfortune a patience which was not without dignity and grace. His small but valuable library was purchased by a friend. Several unfinished works, including one on the struggle between the Avignon Popes and the Babylonian Emperor, another on Benedict XIV., and a continuation of the *Annales Ecclesiastici* from Sixtus V. to Pius VI., are said to be among the papers he has left. His last days were occupied in carrying through the press the Acts of the Council of Trent, which he had reduced from seven volumes to two by sacrificing most of the subsidiary matter. In the summer Theiner went to Austria to superintend the completion of this his last and greatest publication. On the day on which he was to return to Italy he wrote to a celebrated English divine that his work was done, and expressed a hope that a better knowledge of the Council of Trent might hereafter promote the reform of the Church and the reconciliation of Christendom. Three weeks later he was dead. His long life closed, as it had passed, amid much obstinate labour and little joy. In spite of many faults and shortcomings he had rendered great services to learning, and, so far as learning serves religion, to the Church which he sternly loved. His death leaves vacant among European scholars a place which none can fill.

THE HARVEST.

THE clearance from the harvest fields of their golden sheaves is to most people one of the most striking reminders of the passing away of the summer time. To the townsman probably it indicates the ending of the too short summer holiday; to the fortunate few it may mean only the clearance of their shooting ground, while it warns other happy men that the time is come when their horses must be got into hunting condition. Apart, however, from the fading pleasures of those who have been basking in the sun, or from the present enjoyment of those who are driving the partridges from stubble to roots, and from roots to stubble, there is an interest of a more absorbing kind, more or less direct, in which there are few who do not participate, from the statesman at the helm of affairs to the lowest grade of labourer. With all who concern themselves about the fruits of the year's husbandry, and who know what is practically meant by the difference between a good harvest and a bad harvest, it is at the end of August that their anxieties, their hopes, and their fears culminate. It is then that they learn the results of the labours of the tillers of the soil. It is then that they can summarize the effects of the previous winter's frosts and snows, of the genial or ungenial spring, of the scorching or rainy summer. It is then that the merchant gives a hasty glance at the past and sums up its realized profits or losses, and seeks all available information as to the now ingathering harvest on which to form a basis for his speculations in the future. The cost of our bread and of our beer, of our beef and mutton, of the keep of our horses, the doubt whether we shall have enough cotton and tobacco, and what the olive and the grape will yield, are problems for the solution of which we have now more or less adequate data, and they are questions which concern us all. In most countries of the world the national interest is centred in, and the national prosperity depends upon, the success or the failure of the great local crop, whether it be of corn, cotton, sugar, or wine. Our country is so omnivorous that it has an interest little short of universal in the crops of the world. Whatever the earth produces may be found in our markets, and the absence, or even scarcity, of any notable product becomes a hardship and a privation, and probably deranges some branch of manufacturing industry among us. And it cannot be too fully recognized that a revolution has within the last few years taken place in the food as well as in the habits of the masses of the people. Cheap feeding for the working classes was always regarded as a necessary condition of the prosperity of the country, and cheap bread was formerly regarded as synonymous with cheap food. The increased cost of the necessities of life was once the common and only plea urged for increase of wages. Bread was then the staff of life, but now no one imagines that a cheaper loaf would enable employers to reduce wages. Cheap bread is no longer sufficient for the million; its higher or lower price does affect them, but only to the extent of preventing them from enjoying, or enabling them to afford, luxuries. The working class does not save thriftily in times of cheapness, but spends what comes into its hands. The difference between cheap and dear bread is spent in luxuries—meat, drink, and dress. What we cannot produce ourselves must, either in the raw or manufactured state, be obtained from abroad, and thus it is that our interest in the produce of the world has an ever-widening range.

Naturally the chief interest of the country has reference to the produce of our own fields in the way of bread and meat. And the

experience of the past few years has taught us that the only anxiety which really need be felt is as to the future supply of meat. Englishmen have become more than ever a meat-eating people, and the cheaper the loaf the more money they have to spend on meat, and the greater is the demand for it. Even with comparatively high-priced bread we have found that the demand for meat has been so great of late years as to enhance its value to previously unheard-of prices; and, as we shall presently see that there is almost a certainty in the coming cereal year of low-priced bread, we may anticipate that, even with a fairly full supply of meat, the demand for it will be so great as to drive prices higher than ever. It seems to be doubtful, however, whether the supply can be a full one; for it must be remembered that during the past summer there has been no growth of grass, the hay crop was a very bad one, and, except in the North, roots have to a great extent failed. There has been no fattening of beef and mutton during the summer in the pastures, so that the work will have to be done to a large extent by artificial food in the sheds during the autumn and winter; and it will need all the stimulus of high prices to tempt our farmers to undertake so expensive an operation on the considerable scale which our needs demand. It is useless to look for increased supplies from abroad, as we already sweep all available markets within our reach, while the quantities that are brought from the Antipodes are not yet sufficient to make their mark in the way of influencing home prices. Cattle food is dear, and there seems to be every reason for anticipating that the price of meat will be at least as high as ever, even if it be not higher than we have yet seen it. As the difficulty of bringing over fresh meats from long distances seems for the present to be insuperable, the energies of inventors and speculators must still be directed to the importation of lean stock. Abundance of foreign feeding material is to be had, and our farmers are adepts in the art of laying good meat on lean carcasses.

The results of the wheat harvest just concluded afford the most complete contrast to those of last year's harvest. It may be remembered that our estimates of the last crop of Western Europe indicated the necessity of drawing from the rest of the world supplies of immense amount—such an amount that it appeared improbable that they would be forthcoming. It was pointed out at the same time that the potato crop was by far the largest and the soundest that had been grown since the outbreak of the disease, and the hopes which we expressed that the supply of this root would to a very great extent reduce the demand for bread have been realized; for, although the countries of Western Europe have imported wheat on an unprecedented scale, yet the imports have not been so large as would have been required had consumption relied on bread alone. The immense amount, however, of wheat and flour that has been despatched from the Atlantic ports of the United States fairly astonished those skilled in the trade; while the arrivals from California, Chili, Australia, New Zealand, India, and even Japan, show that, with the existing facilities of railway and steamship communication, the entire world sets itself to supply our wants as soon as they become known. High prices were predicted, and perhaps the range of prices was high as compared with years of average abundance, but it did not approach the rates that have been reached even in recent years when the home crop has been poor. Russia, perhaps our most constant purveyor, was unable to afford her usual proportion of our supply. California again made a steady advance in her exportation, and her propitious climate appears to render the production of an enormous and increasing crop of fine wheat year after year almost a certainty. Her acreage of wheat this year is said to approach two and a half millions, while that of the United Kingdom is less than four millions. The country may well be congratulated on having obtained its supplies of bread during the cereal year just closed at a cost far less than could have been anticipated. It has not been without influence on the value of wheat that the crop just reaped presented throughout the period of its growth an appearance promising great abundance. But the experience of the threshing-machine does not quite bear out the promise which was founded on the luxuriant appearance of the fields. From the accounts that have appeared since threshing has begun, it may be judged that the yield of wheat is by no means an extraordinary one. It does not approach, for instance, the great crop of 1868. But still it cannot be doubted that it is rather above an average. The reports of competent judges supplied to the agricultural journals, taken in the aggregate, are in agreement on this point. There are, however, those who estimate the crop at less than an average, and among them appears Mr. Sanderson, who writes to the *Times* that his estimate of the yield is seven per cent. below an average. Mr. Mechi supports him, making an exception, however, for his own county, where he says there is a full average. However trustworthy these authorities may generally be, the observations of independent observers spread over the whole country are at variance with theirs, and it will be safer to accept the unanimous opinion of the multitude of counsellors as correct rather than that of these gentlemen. But it really matters little whether the crop is an average, or a little over, or a little under. The quality of the grain is spoken of as varying, and, whatever may be the quantity grown in the United Kingdom, it is certain that the European crop is a good one, and that England will be the only importing country this year. France and Belgium are reported to have about 15 per cent. above an average; Germany has a crop of fine quality and over an average in quantity; the Austro-Hungarian Empire has enough to allow an exportation of three millions of quarters of wheat;

and Russia, though irregular, will have enough to enable her to export largely. The United States have a good crop, even if it be not so large or of so good a quality as that of last year in the Atlantic States; while the available quantity in California is said to be larger than ever. Last year the doubt was whether it would be possible for us to obtain enough, as France was competing with us. This year there will be no competition; our merchants will have no need to seek for wheat; the producers, having no other customer, must send it to our doors. We shall not only have plenty, but superabundance. There has been already a very heavy fall in prices, and the country has the advantage of obtaining its supplies at moderate rates from the very commencement of the cereal year. As stocks of old wheat are well nigh exhausted, and as consumption of new wheat on a large scale has already begun, the current demand may be expected to absorb the supplies that may be brought to market for some weeks to come. But when shipments of the new crop arrive from abroad in addition to our home supplies, it is certain that we shall have more than we can consume, and a further fall in prices will take place. It may be confidently anticipated that bread will be cheap for the next twelve months. The potato crop is again a good one. In many districts it is larger even than that of last year, and it is quite as free from disease as it was then. During the drought the tubers were said to have ripened prematurely in many parts, and since the rain they have been growing again, thus destroying the value of the original crop. Yet we may reckon on an abundant supply of potatoes. On the whole, we look for very cheap bread and dear meat.

WITH THE CAMBRIANS AT WREXHAM.

TO three-fourths of the British public the archaeologist seems a harmless lunatic, who might be passed by with good-natured contempt if he did not controvert the maxim *quieta non movere*, and if he were not an excuse to local sightseers for creeping into big houses not otherwise approachable. And yet, if any persons owe a debt of gratitude to Archaeological Societies, it is the owners of historic names and ancestral acres, who find in the genuine archaeologist a warm chronicler of their ancient glories, and a propagandist of a conservative spirit by the reverence for old names and things which he infuses into the camp followers. Full well does the antiquary know, as he enters a border town in a train crowded with old-fashioned *savans* equipped with all manner of valises and "vascula," that he owes it to modern toleration that he is neither burnt as a wizard nor consigned as "dangerous" to the nearest asylum; and it is the nearest approach he can make to martyrdom to brave the finger of scorn in his endeavours to trace the "origines" of old homes, families, and institutions, and, in doing so, to contribute to the accuracy of early English history. With how mixed a feeling he is regarded by those whose old memorials are commemorated in his researches is seen in the frequent disclaimers of any special archaeological knowledge by such men as Sir Watkin Wynn, the new President of the Cambrians, who, by his local knowledge, his good sound sense, and his love for a wide district over every foot of which he has walked, ridden, or driven, approved himself at the meeting at Wrexham an antiquary in spite of himself. On the other hand, the celebrated Mr. Whalley proved himself a hollow archaeologist; and after exhibiting at Ruabon two fragments of a stone effigy which he believed to be of the sixth century, but which the veteran Mr. Bloxam at once pronounced to be of the fifteenth, avenged himself at an evening meeting by cutting into a very interesting discussion as to the purpose of Offa's Dyke, and by protesting that the Cambrian archaeologists would do better if they would "rise above the consideration of the material remains of ancient times," and devote themselves to the construction of histories which did not favour Romish interests and Papal aggression. On the whole, however, notwithstanding such occasional interruptions, the evening meetings and the excursions of the Wrexham week may be said to have yielded fair average fruit, and the arrangements of the local Committee were such as to minimize the unavoidable fatigue of the latter and the necessary dryness of the former.

Of the Papers read, the two of most interest were Mr. D. R. Thomas's "Notes on the Archaeology of Wrexham and its Neighbourhood" and the local secretary Mr. Trevor Parkins's Paper on Offa's Dyke. The first of these went deep into the earliest history of the district, and was especially interesting where it showed that the primitive features of the country and its first inhabitants are stereotyped in the nomenclature of the river districts and hill country, as, for the matter of that, they are in the names of the towns. It may be that Wrexham itself is nothing more nor less than the "home of heather," as indicating the physical aspect of the district in early times. To these lucubrations of the learned author of the *History of the Diocese of St. Asaph*, based on a wide antiquarian research and a rare knowledge of his native tongue, the archaeologists of his audience found very little to demur, though one of them took exception to Mr. Thomas's opinion that in the modern coracles to be seen later in the week at Bangor Iscoed, and Overton, might be seen the traces of the early British boats of wickerwork, the art of making which they taught to their Roman masters. But the objection that the ancient coracle was much longer and more substantial than that now in use on the Dee—for did not the coracles of Cæsar's time hold from fifteen to thirty passengers, and did not Columbus cross to Iona with a company of six or eight?—is to be met with the common sense rejoinder that "a boat is a boat," and

that it is not so much the point at issue whether the round wicker hide-clad vessel was a cock-boat or a man-of-war, as whether its fabric and material in days long ago were or were not identical with those of the coracles on the Dee. The paper on Offa's Dyke provoked more discussion, and perhaps claimed wider interest, because the Cambrian antiquaries could not fail to come upon it at almost every turn in their daily excursions. If not on Offa's Dyke, they were constantly coming on its equally curious double, Watt's Dyke, which begins at Basingwerk Abbey and runs south through Malkin, Hope, the gorge of the Alyn, Wrexham, Wynnstay (formerly called Wattstay from this circumstance), and Oswestry, finally disappearing in the flats to the north of the Vyrnwy river. It was pointed out by Mr. Parkins that this dyke was less than a third of the length of that of Offa, which, extending from Tidenham opposite Chepstow, and from near the Severn Estuary, across parts of Gloucestershire and Herefordshire and the county of Radnor, traverses Clun Forest on its way to Montgomery, and runs past Llanymynach, Selattyn, Chirk, Ruabon, and Mold, to its terminus on the Flintshire coast, near Prestatyn, or Tryddyn Chapel, eight miles south of Conah's Quay. The two dykes run more or less parallel to each other, at an interval which varies from a hundred yards to three miles, and it is the venerable opinion of the poet Churchward that this interval was neutral ground—an opinion which Mr. Parkins was disposed to controvert. More incontrovertible is the fact, easily observable, that the ditches of both dykes are invariably on the western side, a reasonable proof that they were not erected for the defence of Wales; and, so far at least, this fact favours the surmise that both may have been the work of Offa, though Mr. Penwell considered that of Watt to be several centuries earlier than Offa's. The quotation from Dr. Powell's translation of the Chronicle of Cadwallader of Llancarvan distinctly alludes the Clawdd Offa to have been made by Offa "the better to defend his country from the incursions of the Welshmen;" and this is consistent with the account of Asser, a Welshman who would know the local traditions. Mr. Parkins suggested that it was probably a work of many years, designed by the Saxons for the circumscribing of the Welsh boundaries, and that it took the name of Offa because he put the finishing touches to it. Great diversity of opinion existed among the antiquaries as to the object of these dykes; those who knew their character in South Wales and the border agreeing with some North Wales authorities that the Dyke could never have been more than a line of demarcation, whilst Mr. Parkins held it to be this and something more—namely, a frontier barrier connecting the numerous camps along its course, and capable of being used for defensive purposes on an emergency. It must be owned that some of the points at which the Offa Dyke was examined by the archaeologists bespeak something more than a mere boundary line, or a provision against a cattle raid, as Professor Dabington suggested, remembering perhaps a bardic allusion translated by the late Mr. Love Peacock in his *Misfortunes of Elphin*, which runs:—

The mountain-keep are sweeter,
But the valley sheep are fatter;
We therefore thought it meet
To carry off the latter.

It is hard to persuade oneself that Offa's Dyke at least was not intended to restrain the forays of the Welsh. The intention may not have been realized to the full, but even so it would have had its secondary use as a "march" which the Welsh were never to overstep without a sense of violated law.

We have dwelt at some length on this topic because the tourist in either North or South Wales cannot help having his mind exercised by these standing memorials of the past, which suggest more tangible questions than the interpretation of British Latin, and Ogham inscriptions—a subject on which Mr. Rhys discoursed to the Association at one of the evening meetings. The subject was too recondite for a mixed audience to profit by, though it gave occasion to one or two curious illustrations of Welsh Latin. The almost invariable use of "jacit" for "jacet" (the active for the neuter) appears to have been the result of copying the Welsh or Gaelic idiom. When we learn that an inscribed stone near Brecon contains the words "surrexit hunc lapidem" (*i.e.* "rose this stone"), we are reminded of the modern Yankeeism, "I was rose, or riz."

Of the excursions made in the Cambrian week none perhaps was more successful than that to Chester, where Dean Howson commented on the glories of his revived cathedral, and Mr. Wynne Fowkes and Mr. T. Hughes acted as guides to the early Norman church of St. John, and the various Roman, mediæval, and Elizabethan memorials of that historic city. The beautiful Perpendicular churches, too, of Wrexham and Gresford, were visited during the week; but our more immediate concern is with the castles, camps, and ancient houses which are so striking a feature of this border country. Caergwile ("the camp of the giant Legion") is an example of a camp and a castle on one and the same site; for it has passed through a series of vicissitudes arising out of its commanding situation, which made it, with Ceor Estyn on the opposite height, a key to the passage into Wales. Originally British, it was later a fortified Roman station, and, still later, a stronghold granted by Edward I. to Davydd, the brother of Llewelyn, and a resting-place for Queen Eleanor, who, tradition says, narrowly escaped being burnt in the conflagration of the castle whilst lodged here on her way to Carnarvon. The outlook on the country around, near and far, shows the importance of such a post. The eye ranges from Runcorn and Overton Brow in Lancashire to the isolated height of Beeston Castle in Cheshire, and has a glimpse

of Delamere Forest, with a full view of Chester, Hope, and other nearer objects. Few situations could be finer or stronger; and after it the British camp of Gardlen, in character, though not in strength or dimensions, akin to Ceor Gyrfan or Old Oswestry, seems tame and insignificant. Within a moderate drive of Caergwile is Hawarden Castle, which was approached by a pretty woodland drive, the untimbered spaces of which are one mass of bracken diversified by the yellow ragwort (*Senecio vulgaris*). By Hawarden Castle the antiquary means the old Edwardian ruin, from the drum-keep of which there is a very fine view of the river and vale of the Dee; and amongst its other remaining features are a recently discovered chapel halfway up the stair to the keep, with a piscina and an altar with the consecration cross upon it, a portcullised entrance gate, and a perfect double fosse. In Mr. Bloxam's opinion this castle occupies the site of an older British fortress. The residence of Mrs. Gladstone, and of the late Sir Stephen Glynne, is a modern structure of the last century. A more memorable place, though at present more modern in its features, is Chirk Castle, visited on the first day's excursion. Standing on the site of the ancient Castell Orogyn, and once a stronghold of the Mortimers, its present structure represents the work of Sir Thomas Middleton, who purchased it in 1595 of the St. Johns, and, according to an inscription on one of the doorways, rebuilt it in one year, 1636. This Sir Thomas changed sides during the Civil Wars, and at one turn of the tide is found as a Parliamentarian general besieging the Royalists in his own castle. Later on, as a Royalist, he vainly strove to hold it against his former allies. The old servants' hall is still hung around with the swords, muskets, and other guns of the period, as well as with a pair of contemporary jack-boots, a pair of black-jacks, and, most curious of all, with a veritable Covenanters' hut, such as is seen in the illustrations to *Lame Walton*, together with what Mr. Bloxam described as its "case," a very early specimen of the now general hatbox. Compared with this hall, and the tower, whence seventeen counties may be discerned, the battlements surrounding the quadrangle, and the dungeon, with its forty-two steps, the interest of the present living-quarters, especially the saloon embellished by Mr. Pugin and filled with fine portraits by Sir Peter Lely, Cornelius Jansen, and others, is only secondary; whilst it is melancholy to see the neglect of the ancient chapel, which one of the Beldaphs in the early part of the last century refitted, according to his lights, but which his descendants have suffered to lapse into an almost ruinous condition. It requires a ramble through the broad and lovely park, with its hundreds of giant oaks that might pay a king's ransom, to restore one's spirits and temper. Whilst on the subject of timber, we must say a word about the oaks and elms of Wynnstay, with its avenue of a mile's length, and its many noble ancestral trees about the park, especially in that part of it which leads to the Column. It is the largest park, we are told, in Wales, and contains the largest oak, one to the left of the avenue, measuring fifty feet in circumference. The house at Wynnstay, it need hardly be said, is modern, its predecessor having been burnt to the ground in 1858; and it is perhaps unfair to criticize its architecture, as Mr. Ferrey's plan has not yet been fully carried out. Within it is full of interest, full of fine paintings, of curious books and manuscripts, and of a quaint blending of relics of local antiquity with modern racing cups won at Chester. There would have been a larger show of the former but for the unfortunate conflagration, in allusion to which a legend in Welsh round the large saloon reiterates the profound saying of one of the sages of Wales, that "it is easier to burn a house than to build one."

JOHN HENRY FOLEY, R.A.

WHAT England, which can boast of Flaxman and of Gibson, should yet care so little for sculpture, need be no matter for surprise. People who live so much within houses as we do, and whose gardens and pleasure-grounds are neither ornamental nor useful during so large a part of every year, cannot be expected to take much interest in white marble statues designed expressly for "standing naked in the open air." If they are made of common marble they soon lose colour and surface. The snow blackens them; the rain turns them green. Only those will resist the weather which are carved in stone so hard that good work is performed with difficulty and at great expense. Even in the grounds attached to large country houses statues are seldom seen. At Chatworth all that are of value are in a gallery within the house. At Knole two statues are in one of the courts, but they are of bronze, and bronze by no means answers to the requirements of the landscape gardener; white marble, to contrast with green trees and grass, and to be reflected in calm ponds, is the best for his purpose. In practice, however, we banish sculpture to our churches and cemeteries, contenting ourselves with bronze in our public places, and with nothing at all in our private ones. How far time may deal gently with Leicester Square and the Albert Memorial we cannot yet tell, but we fear the account, when it does come, will not be satisfactory. One school of art which has come into existence of late years is that of stone carving in architecture, but at best it only stands towards the fine art of sculpture as landscape stands towards figure-painting. Still, when we see the admirable modern work often performed in the ornamentation of restored cathedrals and college museums, we may congratulate our age on the revival of a kind of sculpture so long torpid as to have been virtually dead.

But the present state of sculpture as an art of the highest kind is in England, as well as abroad, matter for melancholy reflection. The more so as we have lost in Mr. Foley a sculptor of whom we were justly proud, and of whom it is no disparagement of his fellows to assert that he was the very best we had. Only one living artist deserves to be named with him, and Mr. Woolner will pardon us for saying that, if he is now second to none, he was ten days ago second to Mr. Foley. America has produced at least two, if not three, sculptors who rivalled Mr. Foley; but France, although the average merit of its artists is high, does not now possess one whose purity of design and perfection of finish are equal to his; whilst in Italy sculpture, like painting, has degenerated into little more than mere dexterity in carving. The saddest matter for reflection is that, though we valued him so highly, his most ambitious works have been suffered to leave our shores. When he had completed his equestrian figure of Lord Hardinge efforts were made to secure a replica for London, but they were not successful; and when the magnificent statue of Outram was so much admired during its temporary exhibition in Pall Mall, a similar attempt was similarly abortive. This is the more to be regretted because, though our hopes of the sitting figure of Prince Albert are justly great, yet we feel that no sitting figure, however grand and however graceful, can be expected to rival in magnificence of effect either the one or the other. And as India has deprived us of Mr. Foley's finest equestrian statues, so Ireland can boast of his best standing figures: for his Goldsmith and his Burke, two of the most gracefully modelled bronzes he ever produced, are set one on either side of the entrance to Trinity College in Dublin. Another statue, somewhat like them in design, the lamented artist had just completed in clay, ready for the casting; but this, which represents "Stonewall" Jackson, and which was subscribed for by English admirers of the great Confederate general, is also destined to depart from England, having been commissioned for presentation to the State of Virginia.

In London, however, we have one of Mr. Foley's noblest efforts. In front of the War Office, and close to the scene of his last labours, we have the bronze statue of Lord Herbert of Lea. There is remarkable grace in its proportions, and a simple pathos, not unmixed with dignity, in its attitude—the head bent down, and supported as if in deep, perhaps melancholy, thought, upon the hand. A comparison of this figure with that of the same subject at Wilton, by the late Baron Marochetti, will at once dispel any doubts as to the immense superiority of the Irish over the Italian artist—a superiority brought into remarkable prominence by a fact which is fresh in the memory of most of us, for when, after Marochetti's death, his full-sized model of the central figure for the Albert Memorial was placed underneath the canopy, it was found so wanting in all the qualities looked for in such a performance that every one was glad to hear of its rejection, and equally glad that Mr. Foley was appointed to fill the vacant pedestal. The completion of his model had occupied him for some time, and the result of his labours has fully justified the choice; so fully, indeed, that there have not been wanting many who wondered that, instead of a foreigner, however eminent, Mr. Foley had not in the first instance been selected for the task. It is now, however, satisfactory to think that the supreme effort of his genius will adorn a monument by which in future ages the art of our own time must be so largely judged. The group representing Asia has been long enough before the public for an impartial opinion to have been formed, and it is not many months since its merit was pointed out in these columns. Even if it is pronounced inferior to some of Mr. Foley's other efforts, it is at least so far a success that it completely eclipses the three groups with which it is associated. It is perhaps a question whether this amounts to praise.

The grace which distinguished more or less all the productions of his chisel is better exemplified by some of his other public works. When the ancient chapel of St. Stephen, so long connected with the glories of our blood and State, was removed to make way for the hall which now occupies the site, a happy inspiration arranged for a series of statues of the great men whose voices had been heard within the old walls. For some four centuries, from the reign of Henry IV. to that of Queen Victoria, the House of Commons had assembled in the chapel, and here the greatest Englishmen had for twelve generations exerted their eloquence. If it was necessary to remove even the ruins, and to substitute a gallery the exact use of which has yet to be discovered, it is at least satisfactory to observe how the wall space is appropriated. The competition in Westminster Hall for the honour of filling those pedestals brought out some of the first talent of the day, and the exhibition of two statues, which we shall notice more at length, secured to Mr. Foley the foremost place. Of the twelve statues of statesmen which now decorate St. Stephen's Hall, two, those of Selden and Hampden, are by him, and it is not too much to say that they are the best of the series, although the average excellence of all the twelve is tolerably high. He also made the fine sitting figure of the architect of the Palace.

But Mr. Foley's minor efforts were not unworthy of him. His "Ivo and the Infant Bacchus" was one of the two referred to above. It was first exhibited in 1840 at the Royal Academy, and was in the purely classical style, of which unfortunately we have so few examples. It depended wholly for its interest on the beauty of the composition and the finish of the execution, having no modern associations to recommend it to notice. But to those to whom sculpture is good only so far as it approaches the examples of the Greeks, this was a subject for almost unqualified admiration. Even this was rivalled by the other statue, the "Boy

at the Stream," a single figure, in which the artist attempted a most difficult task with a considerable measure of success. A young bather hesitates on the brink of a river, leaning back, with an arm stretched up over his head to a branch above, and with one foot pushed forward to touch the water below. The attitude presents, therefore, to the spectator a continuous sloping line from the upraised hand to the down-stretched foot, yet it is managed with such skill, and modelled with such delicate curves, as to give no appearance of awkwardness and no stiffness or formality. These were both early works, but they best represent his powers in marble.

We have already remarked that the chief quality of Mr. Foley's art was its grace. Occasionally his remarkable softness of outline degenerated into something approaching weakness, but in his greater works no such fault is to be found. They were not in marble, but in bronze. The group of Lord Hardinge on his charger will probably be always regarded as his highest achievement. It is in many respects preferable to the Outram. The two stand side by side at Calcutta, and are modelled to the same scale. But this association must render still more unsatisfactory the want of repose in the second figure. Lord Hardinge sits upright on his pawing horse, and restrains it with a firm rein, while he looks before him calm in his dignity. Outram is represented in violent motion. Curbing his horse sharply with one hand, he sits round in his saddle, and holds with the other his drawn sword at a right angle to the axis of the group. His head rests on the flank of the animal, and is the only thing at rest in the whole composition. His countenance is full of ardour, not to say of passionate emotion, and the horse, thrown back almost upon its haunches, paws the air with the fore foot and lashes wildly with the tail. There is no one point from which the statue can be satisfactorily viewed, and the whole effect is as unquiet and as much removed from anything monumental as can well be conceived. Yet, with all these faults, the group is so bold, so full of life and vigour, and so faithfully modelled, that criticism is absolutely set at naught and denied. The originality and talent of the artist are supreme, but the astonishment excited by so powerful an effort of plastic force can scarcely be reckoned a legitimate object of true art. In the other statue there is equal force, but it is latent, and the strength of the design, though not so prominently obtruded, is equally real and much more satisfactory.

Considering the even and sustained excellence of his works, it is worth noting that Mr. Foley never soared into the ideal regions which Thorwaldsen and other great sculptors loved. It is often said that the ambition of every artist in marble is to carve a Venus; and with Gibson, and Canova, and the ancients for exemplars, the aspiration is a worthy one. But it does not seem to have stirred Mr. Foley. He may have nourished some such design, and his *Egeria* at the Mansion House approaches the ideal. But he was, as we regret to observe, only fifty-five, and, had not his life been prematurely cut off, he might have yet executed works greater and higher than any he leaves behind him. That a difference with the governing body of the Academy should for some years have deprived the annual exhibitions at Burlington House of his statues must always be deplored. What his own modesty and retiring disposition would not have desired in his lifetime may now, perhaps, that he is gone, be carried out, and an adequate number of his designs, in plaster, marble, and bronze, be expected to grace the winter exhibition to which we have learned to look forward without fail.

It is too soon to attempt any estimate of the extent of his powers, or to endeavour to fix his exact place in art. The shadow of death is still over his home and his studio. Our regret is too fresh to permit an impartial judgment. Considering his unimpaired industry, he did not produce much, or, to speak more accurately, many things. With him talent was indeed a capacity for hard work. There is no carelessness in anything that he did. Completeness without tardiness, grace without loss of vigour, tenderness without anything mawkish, these were his characteristics. Where he will stand when measured by the stature of Flaxman and Gibson we cannot yet pronounce. But the great in art among whom he rests in St. Paul's have received into their silent society no worthier companion. And the trends he has left behind will not easily fill his place among the living. There were few artists in London less known out of their own immediate circle, but none whose modesty, whose kindness, whose genius had more firmly endeared them to their fellows.

OTTER-HUNTING.

THE general principle of the existing law in regard to the cruel treatment of animals in the way of sport is, we believe, that while tame animals are protected altogether, wild animals are not allowed to be baited within an enclosed space. As long as there is no enclosure a wild animal is quite at the mercy of any person who chooses to pursue it. Thus it happens that, although rattling is prohibited, otter-hunting is still regarded as an innocent and lawful recreation. Yet it would be difficult to say in what respect otter-hunting, as practised for amusement, is less cruel and revolting than the slaughter of the rat-pit. A correspondent of the *Scotman* has just furnished that journal with an enthusiastic account of a bout of otter-hunting in Selkirkshire which certainly betrays a somewhat curious conception both of sport and of humanity.

We will endeavour to give some idea of the nature of this

noble and manly exercise, and as nearly as possible in the graphic language of its gushing votary. Otter-hunting is not, it seems, a regular sport in Selkirkshire. In the first place, the proprietors of salmon fishings wage war upon the otters in the Tweed as systematically as a farmer upon rats in the poultry-yard, and the result has been that they are now pretty well exterminated in this region. Another obstacle in the way of sport is the character of the ground, for "along the entire river-side drains and conduits are encountered in such abundance that it would almost appear as if these strongholds had been put down expressly for the convenience of the game." Moreover, the precipitous banks, thickly covered with furze and brushwood, and honeycombed with innumerable subterranean passages, render "digging-out" extremely difficult and laborious. Still, the greater the difficulty the greater the glory, and therefore the master of the "celebrated Carlisle pack of hounds," eager for fresh triumphs, resolved to cross the border and make a foray down Tweed-side. A considerable crowd gathered to witness the hunt, and we are startled to find it recorded that it included a number of ladies, and even young ladies, who watched the sport with much enjoyment to the end. The pack of dogs numbered fifteen couples, and we have of course a glowing description of their merits. Followed by about a hundred and sixty spectators, Sandy, the huntsman, conspicuous in his scarlet coat, ran his dogs briskly up the stream, and soon they were on the drag of an otter. The scent was traced to a "cundy" or opening in the river-bank. "Off went the terriers into the drain, and the huntsman, listening from the water at the mouth of the suspected hiding-place, immediately afterwards heard the dogs setting at the game." The elevation of otter to the rank of game may perhaps be excused as a touch of poetical license on the part of the chronicler. The otter in this case, however, could not be found; so another was sought for. The "cundy" round which the pack had now assembled was, we are told, an uncommonly ugly one. "Immediately over the entrance to it were the roots of a large tree, which, spreading beneath the hollow bank, might have afforded half-a-dozen otters the means of dodging three or four times that number of dogs, while it was apparent that the drain itself had several ramifications, into any of which the quarry might find its way when driven from another." A council of war was now held, and it was resolved to drive the otter away from his retreat. Preparations were therefore made for digging-out. Coats were stripped, and plenty of willing hands set to work with picks and spades. "Amid the whining of the hounds, the scraping of terriers, the shouting of the huntsman, and the excitement of everybody—not excepting the ladies, who had followed in conveyances—a cutting into the drain was speedily effected." It was not, however, until three openings had been made that the otter was caught sight of. He was instantly pinned by the terriers, and "here followed a piece of sport such," we are assured, "as is seldom seen, even in otter-hunting"; and we must say that we hope that it really is seldom seen. "Into the cutting—an excavation of about three feet deep and as many in length—all five terriers leaped, and fastening on their game, under the very eyes of the spectators, made a vain attempt to worry him, the hounds being meantime held off by the huntsman." The dogs had a tough job, but they "stuck to their work, and for the next three minutes the most that could be distinguished in the struggling group was the wicked-looking eyes and shining ivory of the otter as he savagely punished his opponents." It is possible, of course, that the otter, if he had had a chance of describing the scene, might more reasonably have spoken of the "wicked-looking eyes" of the gallant sportsmen who were deriving pleasure from the sight of his miserable struggle for life. At last, we are told, it was seen that "the only chance of prolonging the hunt"—that is to say, the wanton torture of the wretched otter, which was supposed to be in danger of being too summarily put out of his agony to please the hunters—"by getting the otter into the water, would be to tail him." With a view to effect this the gentleman in charge of the pack seized the otter by the brush, but was compelled to drop him. "Again for a few minutes the worrying was renewed," until another sportsman joined in the worrying, and "by sheer strength tore away the prize from the terriers" and flung it into the water. The whole pack of dogs plunged after it, "followed by about a score of gentlemen, whose ardour the cooling bath served in no degree to abate." The otter succeeded in again getting into a hiding place at the root of a tree, the scent was lost, and it seemed as if, after all, there was not to be a kill. The wretched creature was, however, once more detected, and "a splendid mid-river hunt was witnessed, the otter swimming down stream, with the dogs yelping and plunging after him." Being all but hunted down, the wretched beast made for the north bank, where Sandy, seeing that he was quite exhausted, seized his tail and held him up in view of the hounds—a fine-looking dog otter, weighing fully twenty pounds. "The dogs, both hounds and terriers, fastened on their prey with a will, and within a couple of minutes, during which the otter did not fail to bleed several of the terriers, all was over," or, in other words, the helpless animal was torn to pieces by the dogs as a delightful finish to this exquisite amusement. And so ended "one of the finest runs the Carlisle pack has had this season."

There could hardly be a more striking illustration of the extremely artificial ideas which many persons entertain with regard to what constitutes sport, as well as what are the obligations of humanity, than the popularity of this nasty and brutal amusement of otter-hunting in the Border districts. It should be observed

that this sport is not confined to people like the roughs of the Black Country or to the lower classes of the districts in which it is indulged in. It would appear that country gentlemen and farmers of the better sort take part in these disgusting exercises, and enjoy digging out the otter, and even having a personal tussle with him in the water. It may be said that the chief difference between fox-hunting and otter-hunting is that in the former case the sportsmen are mounted on horseback, and that a sport ought not to be disparaged merely because it is pursued in a humble manner on foot. At least, however, the art of bold and skilful riding is, in its way, a very useful and important accomplishment, and as much can hardly be said for tramping up and down the side of a river, bawling to dogs in order to incite them to worry an otter. Moreover the pleasure of fox-hunting lies, not in the sufferings of the fox, but in the exhilaration of the chase, which indeed, if hunting-men had only a little imagination, might be enjoyed just as well without a fox at all. It is impossible to read the accounts of otter-hunts which appear from time to time without being struck by the sort of gloating satisfaction with which the agony of the wretched vermin is described. Moreover fox-hunters do not take a direct personal part in the capture of their victim as the otter-hunters do. It is certainly not our intention to justify fox-hunting in every respect; but it is obvious that it has various redeeming qualities which are entirely wanting in the other case. It is quite right no doubt that otters should be kept down, or, if possible, exterminated, inasmuch as they prey upon the fish, which are valuable property. But they should be killed in the simplest and most expeditious way. The bad point of otter-hunting is the pleasure which is apparently derived by the sportsmen from a very disgusting sort of butchery. In the instance we have cited, the sufferings of the otter were deliberately prolonged in order that as much fun as possible might be got out of its protracted torture. The most serious aspect of the case is not, however, the misery of the animal, but the effect which such savagery can hardly fail to produce on those who witness and take part in it. If ratting is admitted to be a demoralizing sport, it is impossible to imagine what can be said in favour of otter-hunting. Quite recently a gentleman in Cumberland discovered that his keepers were in the habit of making sure of sport by providing a "bag" otter, which was hunted from time to time till fairly worn out, and which, from having been kept in captivity, was of course no match for the dogs. Setting dogs to worry rats in a pit is not a whit worse than setting dogs to worry an otter in a hole. In reading the account of the spade-work which appears to be indispensable in this amusement, one cannot help wishing that the otter-hunters would imitate the example of Mr. Ruskin's young friends at Oxford. If they must dig, it would be much better that they should employ themselves in making good roads and ditches than in contriving wanton torture for miserable vermin, to say nothing of the sufferings of the dogs, which are often maimed or killed. Altogether, otter-hunting appears to be about as cruel and barbarous a form of sport as can well be imagined, and if it is to be considered a legitimate amusement, there is no reason why rat-hunts in the sewers should not also be permitted. The whole subject of the rules relating to cruelty to animals requires to be considered, in order that the law may be thrown into a logical and consistent form, and it is to be hoped that this very necessary work will not be too long delayed. It is unfortunate that the charge of these questions in Parliament is too often given to legislators who have plenty of tender feeling, but very little common sense. A law which aims at too much is certain to defeat its object, but the deliberate and wilful torture of any animal for the mere sake of sport, and beyond what is unavoidable in the necessary measures for its destruction, ought certainly to be punished.

DIES IRÆ.

THE new number of *Macmillan's Magazine* contains an article on this sequence, signed by Mr. A. Schwartz. The writer's name, by itself, would lead us to expect an acquaintance with German literature, and it is to Germany that we are chiefly indebted for our information as to the history of this and other Latin hymns. The subject, too, would warrant our supposing that Mr. Schwartz had consulted at least some of the authorities who have devoted time and trouble to it already. But his knowledge appears to have been acquired without any reference to the works of Daniel and Mohnike, and the investigations of which he speaks with complacent self-satisfaction to have been confined to a reading of the history of the Franciscan order which was published two centuries ago or more by Wadding, an Irish friar, whom Mr. Schwartz uniformly quotes under the grotesque latinized form of his name. The English style of Mr. Schwartz is so good that we cannot easily believe he is not a native of this country. But if this is the reason for his ignorance of the *Hymnologische Forschungen*, it yet will not account for his never having seen the most ordinary English authorities. That any one should sit down gravely to write about the Latin poetry of the middle ages without a long and careful study of the numerous works of the late Dr. Neale is almost incredible; and it is equally wonderful that, treating of *Dies Iræ*, he should never have read what Archbishop Trench and other English writers have said of this famous sequence. But no such course of study seems to have been pursued, and Mr. Schwartz has plunged into his subject with the air of a man who had made a discovery himself, or of one

whose reading had broken off very near the point at which the whole modern literature of Latin hymnology begins. It is now about a twelvemonth since an article by the same author appeared in the same magazine and upon a similar subject, the *Stabat Mater* of Jacopone. And in treating of this well-known poet he fell into an error of omission very like that which is the occasion of our present remarks. He did not so much as mention the *Stabat Mater Spectosa* of Da Todì, and apparently was quite ignorant of its existence. In his present paper he complains that, notwithstanding all his endeavours, he has not been able to find either of the other two hymns with which Thomas of Celano is credited; a failure only explicable on the theory that all his endeavours had been made with a resolute determination to consult none of the usual authorities. This obliquity is the more to be lamented because Mr. Schwartz writes and criticizes with evident ability, and would probably, to judge from these two papers, have been able to throw some light on a difficult question, and one which few writers are competent to discuss. Although the literature of the mediæval rhyming hymn-writers excites a growing interest at the present day, and although some modern students, including several of the highest eminence, have amused their leisure with translations of English hymns into the old language of religion, much remains still to be done, especially in identifying the age of the original manuscripts in which such poetry is to be found.

Whether or not Thomas of Celano wrote the *Dies Iræ*, there are good grounds both for attributing it to a member of the Franciscan order, and for assigning it to a date very nearly contemporary with St. Francis himself. We are not concerned to go into the question. It is fully stated and weighed by Daniel, and though the fifth volume of his *Thesaurus* is somewhat scarce, and does not occur in the Catalogue of the British Museum, it is to be found in more than one public library of London; and the more important portion of his notice of this sequence is contained in the second volume, which is sufficiently common. It is, however, in the fifth volume, as Archbishop Trench has pointed out, that the two hymns relating to St. Francis are to be found. The first of them begins with this stanza:—

Fregit victor virtualis
Ilic Franciscus triumphalis
Crucis adversarium:
Crucis later cordialis
Princeps pugne spiritus
Insignis amantium.

The whole poem consists of seven or eight similar verses interspersed with a kind of chorus:—

Dicas nobis, O Franciscus,
Cur affixus sis in cruce?

Or:—

Die, Franciscus, quid fecisti
Postquam Jesum aspexisti;

and the Saint is made to answer to the first question:—

Quia crucis contemplator
Atque carnis supplantator
Semper fui sedulus:
Quia mundi abdicator
Atque crucis imitator
Vite Christi bajulus;

and to the second:—

Dulcem Jesum quo ardebam
E vicino distinguebam
Aspectu seraphico:
Grato vultu astuabam
Et effectum excedeabam
Affectu mirifico.

From these specimens it will be possible for a competent critic to judge how far it may be correct to assign the poem to the author of the *Dies Iræ*. Daniel gives the text as it was contributed by Dr. Neale to the *Ecclesiologist* in 1853. He had copied it from a manuscript book of Hours in the National Library at Lisbon. But the hymn had already been printed several times, and a writer in the *Rambler* pointed out, during the same year, that it was to be found in at least three French books of devotion before 1555.

The other poem attributed to Thomas is of a somewhat different character. It is printed in the *Acta Sanctorum* for October, and seems, from the way in which St. Francis is addressed, to be of later origin than the *Fregit victor*. It begins thus:—

Sanctitatis nova signa
Prodierant laude digna,
Mira valde et benigna
In Francisco credita.
Regulatis novi gregis
Jura dantur novæ legis,
Renovantur jussa regis
Per Franciscum tradita.

And the best verse is perhaps this one:—

Quærit loca lachrymarum.
Promittit voces et amaram,
Genit matris tempus carum
Perditum in seculo.
Mentis autro sequestratus
Plorat, orat humi stratus
Tandem mente serenatus
Latitat ergastulo.

However highly these two poems may be estimated, it cannot be denied that at best they are very inferior to the *Dies Iræ*. They have little of the musical intonation, little of the easy and flowing rhythm, and, what is more to the purpose, they are wholly wanting in the force and majesty which make it what it is. Still there is no reason to be derived from a comparison of the three which

would justify us in supposing that they were not written by the same writer, although no testimony to connect them with Thomas of Celano has been quoted of earlier date than that of Bartholomew Pisano, who lived at the end of the fourteenth and beginning of the fifteenth centuries. It has not been uncommon in the annals of literature to find a poet who deserves to be known by a single poem only. Wolfe would be forgotten but for his *Burial of Sir John Moore*. Shirley and Shenstone and Carey are chiefly remembered for a single effort of true genius; and, to keep within the boundaries of the Franciscan order itself and the number of the founder's own disciples, St. Buonaventura and Giacomo da Todì, although both were voluminous writers, would neither of them be known out of a narrow circle but for the *Stabat Mater* of the one and the *Recordare Sanctæ Crucis* of the other.

Collectors of the curiosities of hymnology have a fair field opened to them by the number of translations made of the *Dies Iræ* and the number of versions which exist of the original. A hymn which has appealed so warmly to the feelings of great men in all ages since it was first composed is sure to have enjoyed the good offices of numberless imitators and improvers. What Goethe has done in his *Faust*, and Sir Walter Scott in his *Lay of the Last Minstrel*, has been done by a still more recent writer in a comparatively modern novel. Every one who has read *Uncle Tom's Cabin* will remember the use made by Mrs. Stowe of the lines—

Recordare, Jesu pie,
Quod sum causa tue viæ:
Ne me perdas illa die.

Yet it is curious to note that, though Daniel gives translations into Greek and German, and, though some of our best living writers have tried their hands upon it, no adequate rendering of the original has ever been produced. Perhaps it is even stranger to observe that the best English version is apparently unknown to almost all the commentators. Among the curiosities of literature bibliographers are acquainted with a few manuals of devotion printed in the last years of the disastrous reign of James II. Among them is one of which we have met with but a single copy. Our researches have perhaps been conducted too much upon the plan pursued by Mr. Schwartz, but that the book in question is scarce may be gathered from the fact that no copy is known to exist in the national library at the British Museum, nor yet, so far as we are aware, in any of the other libraries to which the public have access in London. It is a little duodecimo entitled *The Office of the B. V. Mary in English*, printed by Henry Hills, "printer to the King's Most Excellent Majesty for his Household and Chappel; and are to be sold at his Printing-house on the Ditch side in Black Fryars, 1687." It contains, according to a summary on the title-page, among other devotional offices, "the sequence, *Dies iræ, dies illa*, that is sung at solemn Mass for the Dead, and the *Libera* that is sung after Mass for the Dead; all in Latin and English." We venture to subjoin a few verses, choosing those in preference which attempt to overcome the difficulty of rendering those stanzas of the original most often vainly essayed by translators of the present day. The first verse is of the usual type:—

Day of wrath, that dreadful day,
Shall the world in ashes lay:
David and the Sybills say.

This is hardly equal to Scott's

That day of wrath, that dreadful day
When heaven and earth shall pass away,

but he avoids the last line. *Hymns Ancient and Modern* has, besides Scott's paraphrase, a rendering by Dr. Irons, whose first verse is perhaps the best of the three, though it does not give the original literally:—

Day of wrath! O day of mourning!
See fulfilled the prophet's warning!
Heaven and earth in ashes burning!

But the second verse in King James's little book is by far the most successful imitation of the Latin:—

What a fear will all surprise
When the Judge aloft in Skies
Comes to hold his great Assize!

The three verses which commence with the line

Rex tremende majestatis,

are thus given:—

King of dreadful glory mine,
Who savest freely those are thine,
Save me, Fount of Love Divine.
Jesus sweet remember, I
Am the cause thou canst not die,
Damn me not eternally.
Lost, thou me hast weary sought;
On the cross me dearly bought:
Let not those pains profit nought.

And what is usually made the last stanza, as indeed, both in the judgment of Archbishop Trench and of Mr. Schwartz it should be, is thus rendered:—

Lowly suppliant, I thee pray,
With a heart contrite as clay,
Guard me on my dying day.

Nothing is further from our thoughts than any wish to discourage investigators in this field. But it is not either to ancient or modern printed books that their attention should be directed. Above all, they must not stop short at Wadding, or Clichtoveus, or Durandus, nor even at Leyser or Wolf. To determine the

authorship or age of a Latin hymn requires the comparison, not so much of authorities, as of original manuscripts. The date of the writing is a matter on which many can pronounce, and the occurrence of any remarkable hymn should always be carefully noted. We have as yet only the authority of Mr. Thomas Wright for assigning the *Our Mundus* to an English writer earlier than Jacopone, but its appearance in an English manuscript of the thirteenth century is not conclusive. The great poem from which Dr. Neale has given us "*Jerusalem the Golden*," again, is but little known, and its latest editor has for some inscrutable reason omitted to name his original authorities. In fact, the whole subject is in an unsatisfactory condition, and it is disheartening to see a writer apparently so well qualified by education and critical power as Mr. Schwartz wasting his time and ours by such a pair of articles as those to which we have referred.

THE MARTINI-HENRY RIFLE.

THE discussion as to the merits of the Martini-Henry rifle which has been carried on in the *Times* for several weeks appears to have pretty well worn itself out. The controversy has indeed ceased to have any real life in it for some time past, and when it comes to men gravely considering the question by the light of some mysterious law in obedience to which it appears that soda-water bottles ought to travel eternally through space back side foremost, it is clear that they have wandered about as far from all useful discussion of the subject as it is possible to go without losing hold of it altogether. But, although the controversy has all along been overlaid with a vast amount of what may be fairly called rubbish, and has disclosed the fact that a number of practical riflemen, after all, know very little about rifles, it has not been altogether unprofitable, and it has elicited some interesting expressions of opinion from men who have a right to be heard on the subject.

The importance of thoroughly satisfying ourselves that the rifle with which our troops are about to be re-armed is in all respects an efficient and superior weapon is paramount to all considerations of the amount of time, trouble, and expense expended on its introduction; and if it could be shown that the Martini-Henry was in any respect the failure which some of its opponents allege, it would certainly be no sufficient answer to say that it was the result of the prolonged deliberations of more than one thoroughly competent and conscientious Committee, and that the experimental trials with the arm were continued at no little cost over a period of rather more than four years. Nor would it be a sufficient answer, if the arm proved really unsatisfactory, to point out that, if the question were to be reopened, the re-arming of our troops must be postponed for some indefinite period, during which they must be content with the useful, but now somewhat antiquated, Snider-Enfield. On these accounts, while it seems desirable that the subject should receive careful consideration, and that the objections which have lately been so copiously urged against the new rifle should, if possible, be traced to their source, it hardly appears to us necessary to travel over ground which has already been covered in these columns, and to recapitulate the history of the weapon and the circumstances of its introduction.* We prefer to go at once to the point, and consider whether the statements which have recently been made respecting the supposed shortcomings of the arm are such as to justify anxiety, and to warrant any hesitation in the issue of the large number of Martini-Henry rifles now in store. Have we got, in this arm, a thoroughly efficient weapon? Is really the question for consideration; to which the further questions whether Colonel Fletcher's Committee properly discharged its duty, or squandered the public time and money, and whether the opposition to the arm is or is not an interested one, promoted by disappointed gunmakers and fostered by rival inventors, are entirely subordinate.

In order to consider this question properly it is necessary to bear in mind that the Martini-Henry, like every other breech-loader, is really a composite weapon, consisting, in fact, of three main elements—the barrel, the breech-action, and the ammunition—and that between these elements there is no necessary and inseparable connexion whatever. Indeed, the Henry barrel was originally wedded to the Henry breech-action, and the Martini breech to the Martini barrel; while both the original arms fired ammunition differing in many essential details from the Boxer-Henry ammunition now in use. It would, therefore, of course be possible to modify or supersede one of the elements of this combination without abandoning or modifying either of the other two. The Henry barrel, or the Martini breech, or the Boxer cartridge, might, either of them, be given up, and the remaining distinctive features of the arm retained. It is remarkable how persistently this elementary fact is ignored in the criticisms of the arm. An attentive consideration of the grounds upon which the opponents of the Martini-Henry rifle allege that it is a failure, will show that there is really very little in common among them as to the nature of the defects. A condemns the arm because it recoils too much; B, because it heats too rapidly; C, because it fouls; D, because the breech-action is "unmechanical"; E, because he objects to a spiral spring. It may no doubt be urged that this only makes the matter worse, as indicating that the arm is thoroughly bad all round, and this would no doubt be the case if the several critics could each make good their respective objections. But it is proper to point out that the force of A's objections is not necessarily

increased by the fact that B and C have also objected to the weapon on separate grounds; the barrel is not necessarily bad because the spiral spring is defective; and the case which has been presented against the arm has no doubt acquired a specious and really unfair importance from an appearance of unanimity of criticism which in fact does not actually exist. It is important, therefore, when the Martini-Henry rifle is condemned, to discover which particular element of the combination is called in question; and on this account it is indispensable that the subject should be treated in detail, and that each objection should be taken separately, and not lumped together with the rest in a manner which, however useful as a means of exciting public prejudice, is worthless for the purpose of accurate and scientific investigation.

Taking, then, the breech-action first, let us consider what are the objections which have been alleged against it, and how far they are tenable. With the objection that the breech-action is "unmechanical" we are quite unable to deal, for the reason that the expression is wholly vague and unmeaning. It was an objection which was very freely used until Mr. Nasmyth gave it what we had hoped would prove its *coup de grace* when, in examination before the Small Arms Committee, he said:—

Mechanical and unmechanical is a sort of slang term in mechanism. . . . There is nothing unmechanical in any constructive arrangement that accomplishes its object, and, if that object is accomplished in a simple and effective way, that combination is good. . . . I think the ends are very admirably attained in reference to the rising block [of the Martini action] by the means employed. It is objected that it is a lifting of the weight at the wrong end. The whole mechanical construction of the human frame is based on lifting weights at the wrong end; all our limbs are lifted at the wrong end, so to speak.—(Q. 70).

The very random assertion that the arm has been condemned by every mechanical engineer who has considered it may be shortly disposed of by the statement that the only four mechanical engineers by whom the breech-action has been formally considered, Mr. Hutton Gregory, Mr. Nasmyth, Mr. Polo, and Mr. Woods, have expressed the highest opinion of it; and to this testimony might be added that of the practical men connected with the Government departments upon whom the duty of manufacturing the weapon devolves.

Passing to the next objection, which has been elaborated with a great parade of mechanical phraseology by Mr. Dunlop, that the spiral spring is defective because it gives a push rather than a blow, it is only necessary to observe that this objection is neither theoretically nor practically tenable. It is not theoretically tenable, because, as Mr. Polo has demonstrated mathematically, "Although the dynamic force of the blow" (struck by the spiral spring) "is less" (than that struck by the flat spring), "the striking velocity is greater; or, in other words, instead of being, as has been asserted, analogous to a dead pressure, the Martini spiral spring really strikes a smarter blow than the old lock action" (Q. 9). It is not practically tenable, because, as a matter of fact, the spiral spring does its work exceedingly well, exploding the caps with a regularity and certainty which leave nothing to be desired. It may be added that every spring goes through a variety of tests before being placed in the gun, including the striking of over five hundred blows; it is very rare indeed for a spring to break, and even if it did, it could be replaced in less than a minute.

Next, it is alleged that the "pull-off" of the gun is liable to vary. If it is meant by this that the construction of the lock is such as normally to involve an uncertainty in the pull-off, then it appears to us that this is an objection which was very completely disposed of by the mechanical engineers who reported on the arm, as any one may see who will take the trouble to refer to the evidence; and if it is meant that the pull-off is liable to be variable if dirt or grit gets in, it may be sufficient to remark that, if dirt gets into any lock, it will work less easily and correctly than when clean; and if the Martini lock enjoys no special immunity in this respect, it at all events possesses the advantage of being exceptionally well protected against the entry of dirt and other disturbing causes. Then it has been said that the pull-off may be easily tampered with in the Martini rifle, and made much less than it should be. On this point we would observe that it would be exceedingly difficult to make a lock which could not be thus tampered with; the Snider lock can be tampered with in exactly the same way, and it can easily be made to pull-off at, say, eight pounds, then at two pounds, and then back again at eight pounds. The trick is so well known to riflemen that it indicates a very strong determination to find fault with the Martini-Henry, or a very imperfect acquaintance with rifles generally, when the new Government arm is represented as being specially open to objection on this score.

The objection that the leverage of the extractor is less than that of some other arms is not worthy of serious consideration, seeing that not the slightest failure has occurred in regard to the extraction. If the lever is sufficient to do its work, that is all that is necessary.

We believe that the foregoing summary exhausts the charges brought against the breech-action, and these charges certainly do not appear to us to warrant the slightest uneasiness as to this portion of the arm. Turning to the barrel, we find that the critics object that the shooting is not always what could be desired, that it fouls and heats rapidly, and that the recoil is excessive. The objection on the score of inaccuracy is not one which has been very prominently put forward, and it is flatly contradicted by the facts. There is no point which was more carefully and precisely investigated before the arm was recommended for adoption, and its subsequent performances at Wimbledon and on the proof-grounds

* See *Saturday Review*, September 17, 1870; April 8th, 1871.

have certainly not belied the promise of its earlier performance. The only trustworthy way of testing the shooting of an arm is by firing it from a fixed rest; and as a very large proportion of the guns and ammunition manufactured at Enfield and Woolwich are daily proved by firing in this way, there is available a mass of accumulated experience of the accuracy of the arm to disprove the curiously incorrect assertion that there has been any failure in accuracy. And even if there had been any such failure, that would be no sufficient reason for assuming that the barrel was in fault—not, at least, until the fault had been shown not to rest with the bullet or powder. As to the rapid fouling, it must be remembered that the fouling of a breech-loader does not affect facility of loading; it is therefore only necessary to consider it in relation to its influence upon the accuracy of shooting; and we believe it may be confidently asserted that fouling does not occur in the Martini-Henry rifle within the number of rounds that a soldier would be likely to fire at any one time on service without cleaning, to a degree sufficient to affect the accuracy of the arm.*

The rapid heating of the barrel is very simply dealt with—if indeed it has not been dealt with already—by the use of a leather pad or protector; and in any case it is not a defect specially connected with the Martini-Henry, seeing that it would exist in any rifle having the same charge of powder and thickness of barrel. The question of recoil is the next point, and this appears to us to be the most important, as it certainly is the best sustained of the objections against the arm—though even here we have no hesitation in saying that the objection has been exaggerated. Before considering it, however, it may be well to say a few words about the third element in the Martini-Henry combination—the ammunition. Except in so far as the weight of powder and bullet connect themselves with the question of recoil and accuracy, no complaint seems to have been made of the ammunition. The cartridge appears to do its work of checking the escape of gas well, it extracts easily, and its general qualities being the same as those of the well-tried Boxer cartridge, which has been in use with the Snider since 1866, it may be accepted as thoroughly satisfactory. This leaves us with the powder and bullet, and brings us back to the question of recoil.

We find, on referring to the Report of the Committee, dated July 12, 1870, that this point was very closely considered by them, and that among the questions submitted to the troops by whom the two hundred experimental arms were tried was this:—"Is any inconvenience experienced from recoil?" To this question forty-nine answers were returned from different regiments. Of these forty-nine answers, twenty were simply "No"; eleven were what may be called a qualified "No" ("No; but more than with the Snider"; "Not since the men have been cautioned not to place the thumb across the head of the stock"; "No inconvenience, but the recoil is greater than with the Snider," &c.). One regiment returned no reply; the remaining regiments (seventeen in number) replied more or less decidedly that the recoil was inconveniently great, but in the majority of cases it was stated that this did not occur until after a large number of rounds had been fired. The Committee's remarks upon these replies are as follows:—"The great majority of the answers state that the recoil is not excessive. This opinion is in accordance with the reports previously received." These trials were with the "long-actioned" Martini-Henry arm. When the "short-actioned" arm (for the "bottle-necked" cartridge) with a shorter and lighter barrel was proposed, this Committee carefully kept the question of recoil in view, and they reported that they found that, "by shortening and reducing the comb of the stock, the recoil from this rifle" (weighing 8 lbs. 12 oz.) "is less felt than the recoil of the original Martini-Henry pattern arms, which weigh 9 lbs. 7 oz." Two things are apparent from these extracts—1st, That the recoil of the weapon before adoption was pronounced by the large majority of the regiments who tried it to be not excessive—and we have not seen, in the course of the recent controversy, any statement that the army generally has reversed this opinion; 2ndly, That the question of recoil is in a great degree bound up with the question of the form of the stock, and this of course will be a variable element according to the height and make of different men.

The question at present to be considered, then, is whether the opinion expressed by the majority of the regiments as to the recoil of the experimental arm is still retained by the rank and file with regard to the present arm; and this, as the *Times* very properly observed, is a question which can be decided by the rank and file of the army, and by no one else. If there are any *prima facie* grounds for instituting this inquiry, it should be carried out forthwith, and a conclusion could be arrived at in a very few weeks—if, indeed, the School of Musketry is not already in a position to state authoritatively the opinion of the men on the subject. If the replies should generally be to the effect that the recoil is inconveniently great, then what steps would have to be taken? Not, happily, the very serious step which the opponents of the arm and rival inventors would gladly persuade the public is inevitable—the abandonment of the Martini-Henry rifle in favour of some other weapon, but simply the readjustment of those elements upon which the recoil, or the inconvenience experienced therefrom, depend; and these elements are three in number, (1) form and length of stock; (2) weight of arm; (3) weight of charge and bullet. We trust that the verdict of the army will be that the recoil is not excessive—it is, at any rate, no greater than is experienced with an ordinary fowling-piece firing $\frac{3}{4}$ drachms of powder and $1\frac{1}{2}$ oz. of shot, being only about 63 lbs. as compared with 53 lbs. with the

Snider; but if it should be otherwise, then one or other of the solutions indicated above may without difficulty be adopted. Of the three it is probable that the reduction of the weight of charge and bullet would be attended with the least inconvenience; and experiments have shown that a slight reduction of the weights of the bullet and powder (as, for example, to an 80-grain charge and a 410-grain bullet) may be effected without materially prejudicing the practical efficiency of the rifle. Of course a 410-grain bullet (with 80 grains of powder) would have a somewhat inferior range, accuracy, and penetration at long ranges to the present 480-grain bullet and 85-grain charge; but it would, we believe, possess a flatter trajectory at what may be regarded as the normal fighting ranges, and the reduced weight would certainly allow a rather larger number of rounds to be carried. If the recoil were also thereby sensibly reduced, the balance of advantages would probably be considered to incline to the side of the lighter bullet and charge. But although we should be prepared to regard this slight reduction with tolerable complacency, we are of opinion that the present weights should not be disturbed without thoroughly sufficient reason, because those weights have been demonstrated, by the most exhaustive experiments, to form, with a .45 inch bore, the best shooting combination that can be contrived, and it is undesirable that we should be content with second-best so long as the best is within our reach.

A careful consideration of the criticisms to which the Martini-Henry rifle has been recently subjected can hardly fail, we think, to bring dispassionate observers to the conclusion that the outcry which has been raised against the arm is not justified by any defects which our experience of it has brought to light, and that, with the solitary exception of the alleged inconvenient recoil, all the objections which have been urged are objections which have been urged, considered, and disposed of over and over again. There appear to be no grounds whatever for the slightest anxiety on the part of the army or the public, still less for any reopening of the question. As regards the single objection worthy of serious notice—namely, that the arm has an excessive recoil—we have yet to receive the verdict of the men for whom this weapon has been manufactured as to whether this objection has any real practical existence, and whether such complaints as have been made on this score have not been greatly exaggerated. But if the recoil should be considered by the army at large to be inconveniently heavy, this defect would in no way impugn the principle of the arm, whether we consider the breech-action, the barrel, or the cartridge, and can be rectified in a manner which will leave us with what, we have no reason to doubt, will still be the most effective breech-loading rifle yet introduced for military use.

REVIEWS.

KHIVA.*

"WHEREVER there is anything uncomfortable to be done," said the Chairman at the dinner of the Newspaper Press Fund, "there the Special Correspondent is sure to be found." Nothing now is too remote or too arduous for his adventurous spirit. The arid plains of Behar, the dense jungles of West Africa, and the glowing sands of Turkestan, have, during the last twelvemonth, been witnesses of his energy. The writer of the present work is an American gentleman, the Correspondent of the *New York Herald*, and we commence by saying that he has given us a record of his adventures, graphic, spirited, interesting, and entirely free from those innate or inherited failings to which the race of men who have occasion to use both pen and revolver is justly supposed to be liable. Mr. MacGahan is also a sportsman; something of an artist in his descriptions, though not able to handle the pencil or the brush; if not acquainted with Turkish or Persian, he has made some progress in two or three European languages; his style is free from what we have been accustomed to reprehend as Americanisms; and the whole book contains no passage which we should wish unwritten, no outburst of national antipathy, and scarcely a single instance of bad taste or ungenerous feeling. The conviction left on the mind after an attentive perusal is that the writer has compressed into the space of five months a remarkable variety of events well worthy of narration, and has told us nothing which he has not personally witnessed, or which he has not every reason to believe to be substantially true. He has judiciously divided his book into three parts. The first is taken up with an account of the obstacles and perils of his stern chase after General Kaufmann; the second with the attack on the capital of Khiva; the third with a flying expedition to punish the Turcomans, who have become infamous as the pirates of the desert. The chapters are very numerous and very short; the most striking scenes are illustrated by sketches taken from the Russian artist Verestchagin; and the style is of a kind which never wearies or disgusts. To convey a just idea of the campaign, it was inevitable that the author should dwell on his own personal adventures; but we are quite certain that any redundancy in this part of the work will be readily pardoned, even without the pleas put forward in the preface, that the country was strange, the circumstances peculiar, and the manners and customs

* *Campaigning on the Oxus, and the Fall of Khiva.* By J. A. MacGahan, Correspondent of the "New York Herald." London: Sampson Low & Co. 1874.

of the people comparatively unknown. The difficulties thrown in the way of a Special Correspondent bear some family likeness to those experienced by the Russian soldiers themselves. And it is only just to Mr. MacGahan that we should give a summary of what he went through in pursuit of his main object, which was to be present with the leading column at the fall of the capital of the Khan.

In the middle of April 1873 the writer started from Kazala, a small fortified station on the Jaxartes or Syr-Darya, about fifty miles from the north-eastern shore of the Sea of Aral. From this place to the Russian army, three hundred miles of desert had to be traversed. We should explain that the Russians advanced in five divisions, of which, however, only three demand special notice; one came from the Caucasus on the west, under Colonel Lamakin; another started from Tashkend, or the "Stone city," now a Russian possession, and from the exactly opposite direction, in Eastern Turkestan; the third, commanded by the Grand Duke Nicolas, came right down the "Red Sand" desert by a direct line about equidistant from the other two. After some preliminary obstructions the Special Correspondent was permitted to go from Kazala to Fort Perovsky on the Jaxartes, but evidently under the impression on the mind of the Russian Commandant that he was making for Tashkend. At Perovsky the officer in command proved less obstructive, and saw no reason why an impetuous journalist should not attempt the apparently foolhardy project of running the gauntlet through roving tribes of Kirghiz, to suffer terribly from heat and thirst, or perhaps to die by fever in plains which produced nothing but absinth and brushwood; and this in company with a strange guide, a young Kirghiz, and a Tartar servant who had been picked up at Orenburg, and who was ready to promise everything, and to do nothing at all. The Kirghiz tribes, however, proving friendly, and this part of the desert less inhospitable than might have been anticipated, Mr. MacGahan managed to reach a place called Irkibai in four days and a half, and Khala Ati, otherwise Fort St. George, after a good deal of hardship, in little more than seventeen days. But here the Correspondent had to deal with something worse than doubtful adherents, blazing suns, wells of bitter or putrid water, and dearth of supplies, in the shape of a certain Colonel Weimann, an officer high in command, of German extraction, and stubborn and impracticable. No pass could be granted to proceed a step further without an order from General Kaufmann; and this high and mighty potentate, so Colonel Weimann seemed to put it, could not give permission without being seen, and could not be seen without previously giving permission. There was nothing for it but to give Weimann the slip; and this was skilfully managed by dropping off in the darkness from the rear of the column, which was just then starting from Khala Ati, and by taking to the desert, with the certainty of having only black bread to subsist on, and with the chance of being cut off and made prisoner by hands of marauding Turkomans. It is pleasant to think that this happy audacity was eventually crowned with success. At a place called Altı-Kunduk, or the "Six Wells," our author fell in with another detachment, left behind by General Kaufmann, was refreshed with Liebig's extract of meat, milk, mutton, and a bottle of *vodka*, and was suffered to proceed on his way to the Oxus, in the hope of coming up with the main army. This allowed him just time enough to escape an officer whom, with twenty-five Cossacks, the incensed Colonel Weimann had despatched post-haste to recapture the fugitive. After being again disappointed in finding nothing of the General except the ashes of his camp-fires, this plucky Correspondent closed his desert ride of thirty days by coming up with the main army just in time to hear the roar of cannon and to witness the battle of Sheikh Arik, and to be received in the camp, not as a runaway, but as a "moldyetz," or brave fellow, whose movements had been watched, and whose arrival was greeted with as much interest as if he had been one of the Czar's couriers from St. Petersburg.

From this epitome of a journey characterized by unflinching determination, inventive fertility of resource, and visible ascendancy over Oriental nature, there is much detail that we unavoidably omit. There are sundry experiences which, if they cannot bring into relief the familiarity with Eastern languages and habits which in like circumstances would have been displayed by Mr. Palgrave, Captain Burton, or M. Vambéry, have yet a piquancy and a flavour of their own. And we recommend readers to peruse the work itself in order to learn how this dashing American might have married two Kirghiz damsels on a dowry of a horse, a camel, twenty sheep, and a *kibitka* properly furnished; how he shared his little delicacies with his native guides and servants, but insisted on his commands being obeyed to the letter, and without a murmur; how, after the scanty fare of the Kizzil Kum, he feasted on apricots, melons, and "hot wheat cakes," like the Virginian captain on buckwheat ditto in one of Fenimore Cooper's novels; how, without fear of knife or bowstring, he made his way into the very centre of a Khivan household, was drenched with green tea, and had water poured over his hands, in the genuine Homeric fashion, by innocent and talkative female inmates; how he dined one day with an Uzbeg chief in an umbrageous and well-watered garden of the capital, when the dessert came first, the sweetmeats and cream next, and the heavy *pilao* and rice last of all; how, on another, he was entertained by the Grand Duke Nicolas, and how he shared with that distinguished personage the honour of being tossed in the air by the soldiers, who received him in their arms, and who, it seems, are thus wont to prove their particular affection for a good man and true; how he joined in a charge against Tur-

komans, the description of which suggests elephants trying to come up with gazelles; and how he learnt something of a new kind of fish which the Russians discovered in the Oxus, but which had hitherto been thought peculiar to the waters of the Mississippi. All this and more cannot be given within our limits. But there are some points beyond the personal experiences of the writer, to which we willingly advert.

The description of the town of Khiva strikes us as particularly good in its way. After the dust and heat of the desert it was like Eden to see rippling canals carrying water into fields of waving corn and orchards of ripe fruit; to look up to graceful poplars and to repose under the shade of gigantic elms overspreading dark pools; to inspect houses inclosed by walls with buttresses and strong bastions; to gaze on a celebrated tower of porcelain built of burnt tiles, blue, purple, and green, and skilfully arranged so as to present varied shapes and figures to the eye; to range at will through an armoury which would furnish specimens of odd weapons of all kinds to half the museums in Europe; and to wander listlessly through the bazaar, whence heat and light are excluded, and where tea from Upper India is found side by side with the Russian samovar or tea-urn, and with the plums, apricots, and peaches of Khiva itself. Amongst other curiosities, the Russians are reported to have discovered a beautiful breech-loading-rifle, with a field-glass and a musical-box, presented by the present Viceroy of India to the Khivan envoy so late as 1872; and they also may very likely have come on some papers left by Lieut. Shakespeare, or more possibly by Lieut. Abbott, dating from the days of Russophobia in 1840. Both officers, it may be remembered, figure conspicuously in the narratives of Lord Auckland's policy, and the former was afterwards knighted for his share in releasing the English officers and ladies who were detained by Akbar Khan after the Cabul massacre, and eventually closed an honourable career as Resident of Haroda some ten or twelve years ago.

Correct particulars of the taxation and the revenue of an Asiatic sovereign encircled by a wilderness and subject to no pressure from without are always difficult of extraction, even for officers long accustomed to fathom the mysteries of irregular cesses, payments in kind, divisions of crops between rulers and subjects, and exemptions made in favour of orthodox believers. Without, then, imputing to Mr. MacGahan the slightest bad faith, we should warn readers against accepting implicitly his account of Khivan finance. Indeed he admits that another gentleman who devoted a good deal of time to an investigation of such matters, in which it could have been no one's interest or business to disclose the truth, found them a chaos of hopeless confusion; and that it is impossible to form a correct estimate of the taxes really collected. If the total revenue is not more than 45,000*l.* of English money, all we can say is that Khiva will hardly pay, and that this would be more than doubled by the land-tax easily collected from an average Indian "Famine" district. But the whole picture of Khivan life and habits is by no means dismal or discouraging. The Khivans have excellent mutton, abundance of fruit, corn, and vegetables, wherever water can be made to flow and trees to take root; the Turkoman horses are remarkable for speed and endurance; and the climate, though marked by vicissitudes of heat and cold, is dry, exhilarating at most times, and absolutely unendurable at none. The population, exclusive of the Kirghiz of the Kizzil Kum, is conjecturally estimated at half a million. Of course the Khan's ideas about Farangistan were of that nebulous character which Turkish travellers and Indian Political Residents, when dealing with conservative Pashas and Rajas, have found it so difficult to enlighten. The ruler of Khiva could not understand how any American Khan or President would allow himself to be quietly deposed after a reign of only four years, and we may be quite sure that he would persist in attaching a deep political significance to the recent marriage of the Duke of Edinburgh. Mr. MacGahan, without conceiving himself entitled, on the score of his adventures, to lay down the law oracularly on the Central Asian question, has some remarks on the general aim and policy of Russia which are more worth attention than a good many of the inflammatory articles indited at intervals by some doctrinaires of the Indian press. Not the least valuable parts of his work are his statistics of the forces employed in the expedition. General Kaufmann brought from Tashkend a force of only 2,500 men, made up of 1,650 foot soldiers, 600 Cossacks, and not more than fourteen pieces of artillery. The Kazala or central column did not amount to more than 1,400 men, with artillery in proportion. Besides this we have the western or Caucasian column under Colonel Lamakin. The main difficulty, as may be supposed, appears to have lain in getting the men and the baggage across the desert, and in compelling the Turkoman cavalry to stand and fight. The defence of Khiva, in spite of some strategical advantages, can hardly be spoken of seriously. And, with the exception of one or two occasions when slender outposts were surprised and a few skirmishers slaughtered, the danger or loss to the Russians from their light-heeled or invisible foes was infinitesimal. The real generalship consisted in overcoming the desert and in conveying across such a country a force large enough to provide against mishaps or contingencies, but not so unwieldy as to swamp the commissariat. Mr. MacGahan thinks, and so do we, that for the present a Russian Governor-General in Eastern Turkestan will have quite enough to do in consolidating his influence at the capital and introducing some order amongst the marauders of the steppes. The account of the Russian pursuit of the Turkomans after the fall of Khiva has some painful incidents in regard to which it is very necessary that we should bear in mind what has been the character and what the favourite pursuits

of these unprincipled robbers for generations past. Philanthropists may be ready to exclaim with horror when they read of five hundred Yomuds cut down by the Cossacks or laid low by the breechloaders, of widows weeping and children playing unconsciously over the dead bodies of their husbands and fathers, of valuable carpets and silks carried away as "loot," and of cartloads of grain and household stuff burnt as not worth the carriage. But no sensational writer could well exaggerate the horrors endured by inoffensive Persians, Russians, and others who have hitherto invited the rapacity of these Yomuds and supplied the slave market of Khiva. It is one gratifying point in the Russian ascendancy that henceforth there may be peace and security in the regions round Turbat Haidari and for the caravans of Meshed "the blessed." But even this consideration should not blind us to a state of things briefly indicated by the present author, when possible railroads, generally improved communications, increased facilities for commerce, and irresistible local prestige, if not the entire absorption of the three Khanates, will put Russia in a different position; in one which may bear the same proportion to General Kaufmann's late advance as the campaign of this officer bears to the disastrous expedition of Perovsky. And whenever the curtain is again raised, it may be ten or twenty years hence, for the next act of a drama where the Ten Thousand march onward instead of retreating to the sea, we can only hope that the chronicler of the day may be some one as resolute, as candid, and as graphic as Mr. MacGahan.

TAYLOR'S LEICESTER SQUARE.*

THIS is a bad specimen of a bad kind of book, and certainly ought never to have been written by a man with such fair claims to a respectable rank in literature as Mr. Tom Taylor. What would have been thought six months ago if any equally well-known man had brought out "Wapping: its Associations and its Worthies; with a Sketch of the Claimant's Character from the Notes of the Lord Chief Justice, and an Essay on Lancet Marks, by Sir William Fergusson?" It would have been an equally legitimate literary undertaking, and a trifling effort of ingenuity would have enabled the writer to introduce precisely the same class of matter as forms the padding of the present work. If Mr. Taylor had anything new to communicate, the case would have been different, but we have read his volume from beginning to end, and have no hesitation in saying that, except where he is blundering, there is hardly a line in it which will have any novelty to nine-tenths of Mr. Mudie's subscribers. In fact, we have met many amateur performers at Penny Readings who, with Peter Cunningham's *Handbook* and Mr. Henengo Jesse's *London*, opened at the right places, might be backed to "deliver" an equally good book without further preparation.

Leicester Fields, or Leicester Square, derives its name from the illustrious family of which Sir Philip Sidney was the most distinguished member. His father, Sir Henry, whom Mr. Taylor pronounces to be "the greatest, wisest, and justest Lord-Deputy Ireland ever had before or since," had married the daughter of John Dudley, Earl of Warwick and Duke of Northumberland, whose two sons, Lord Guildford and Lord Robert, are of course made to figure as the "ill-starred" and the "infamous"; in spite of which, however, there can be no doubt that Sir Philip always felt infinite pride in his "Dudley blood," and by no means looked down upon the character and talents of his "infamous" uncle. As Robert Earl of Leicester was considered to have died without any legitimate issue, and Sir Philip had left only an infant daughter, his younger brother, Sir Robert Sidney, became the representative of both the families, and naturally looked to be raised to the peerage. But Elizabeth moved in a mysterious way in such matters, keeping him untitled in the semi-banishment of the governorship of Flushing, and James had been some time upon the throne before he was created Viscount Lisle and Earl of Leicester. During his long absences in the Low Countries, his family had resided in Baynard's Castle, a huge building which stood upon the banks of the river, nearly opposite to the present office of the *Times* newspaper. We suppose there must be some slip of the pen, but, if we may believe Mr. Taylor, historians have all hitherto been wrong about Sir Philip Sidney being mortally wounded in battle:—

Up to the reign of Elizabeth, the Sidneys, like most of the nobility, had lived in the City. Sidney House was on the west side of the Old Bailey; but Sir Henry occupied Baynard's Castle, where his first son died, and where Robert was born.

We cannot quite make out whether the Sidneys occupied Baynard's Castle by a special grant from the Crown, or by the permission of the Earl of Pembroke, who had married Sir Henry's only daughter, the lady immortalized by Ben Jonson in the epitaph which is here shockingly misquoted. This little piece is remarkable for its exquisite polish, and we are surprised that Mr. Taylor, who has himself spun so many verses in his day, should mar

Sidney's sister, Pembroke's mother,
Death ere thou hast slain another
Learn'd and fair and good as she,

by substituting "killed" for "slain" in the second line, and by transposing "learned and fair" in the third. Ben was such a perfect artificer in language that it is always unsafe to muddle

* *Leicester Square: its Associations and its Worthies.* By Tom Taylor. With a Sketch of Hunter's Scientific Character and Works, by Richard Owen, F.R.S. London: Bickers & Son. 1874.

with what he wrote, and even Mr. William Howitt failed to purify and elevate him so much as he supposed when he silently changed *milk* into *cream* in the famous exclamation—

Wine, it is the milk of Venus!

Sir William Sidney, the elder son of this first Earl of Leicester of the new creation, was a young man of singular promise, and died about the same time as Prince Henry, and it is believed, of a similar kind of fever. His place in the family was taken by his next brother, Robert, who in his turn succeeded to the earldom, and obtained the grant of the land on which he built the stately mansion of Leicester House. Here again Mr. Taylor is somewhat contradictory. At p. 236 he says:—"It stood a good way back from the Square, occupying nearly the western half of its breadth, with gardens behind it, running back as far as Lisle Street"—a description which would be tolerably near the truth if northern were substituted for western, and the back gardens of Gerrard Street were made its boundary behind. At p. 27, however, altogether another account is given, and we are told that "the site of the old house must have been about the centre of the present square"; an assertion which he supports by mentioning in a note that Mr. Knowles, the "architect of the alterations," had discovered extensive foundations within the enclosure. But a reference to Strype's elaborate map of St. Ann's parish, published in 1720, will show that the position of Leicester House does not admit of a question, and the foundations in all probability were those of an advanced porter's lodge, or of some of those buildings which were run up in the beginning of James's reign, and ruthlessly pulled down in the terms of the Proclamation. This Earl of Leicester, as Jonson told Drummond of Hawthornden, strongly resembled his uncle Sir Philip, being, like him, "no pleasant man in countenance, his face being spoiled with pimples, and of high blood, and long"; but with these outward blemishes he inherited also the noble qualities of his race, and did not require to be reminded that, to use the words of the same poet, addressed to his dead brother—

'T will be exacted of your name, whose son,
Whose nephew, whose grandchild you are.

Great as his position was, and worthy as he might have been to fill it, he is better remembered as the father of Algernon than by any personal achievements of his own. The stern and determined mind of the young Republican led him very early to play a leading part in his father's family; but we doubt much whether Leicester House was ever frequented by "Hazelrigg and Ludlow, Lambert and Henry Neville, Milton and Oyrac Skinner, Harrington and Selden, Vane and Bradshaw, Wildman and Marten, the *intriguantes*, in fact, of the Revolution," the goodly company with which Mr. Taylor invites us to people it. Algernon Sidney is evidently one of his great favourites, and we may expect to see him ere long on the boards of the Olympic, exclaiming "methinks" or "methought," as certain worthies of the next generation are now made to do in every sentence they utter. It is strange, however, that, when dwelling upon his poverty and his uncompromising spirit, Mr. Taylor fails to make the slightest allusion to the money paid to him secretly by the French Minister. When Sir John Dalrymple first made the discovery, he says he "felt very much the same shock as if he had seen a son turn his back on the day of battle," and immediately made it as public as possible. Mr. Taylor more wisely shuts his eyes to the circumstance altogether.

The next person taken up is Elizabeth, Queen of Bohemia, who is almost always affectingly spoken of as the Queen of Hearts, which Mr. Taylor would lead one to suppose was the name by which she was habitually known. She died in Leicester House, and so far may be called a "Worthy of the Square"; but there was no necessity for telling over again the story of the Palatinate, or for emulating Mr. Hepworth Dixon in describing her as "the mother of more lusty sons and beautiful daughters than were ever given by queen to king," and adding that

the fiery young sworder, Duke Chri-tian of Brunswick, the knightly and courtly Count of Thurn, the grizzled old *condottiere* Mansfeldt, the heroic, high-minded and far-sighted Gustavus Adolphus, the impetuous Bernard of Weimar, the noble and generous Lord Craven, all were alike her devoted servants, ready to sacrifice life and limb, to say nothing of time, toil, and money in her service.

If it was excusable to regard the Queen of Bohemia as a "worthy," we can hardly say the same for bringing in the murder of Thomas Thynne, which took place in Pall Mall, as an "association"; the only connexion between the event and the locality being that some of the crowd ran off to the house of a Swedish physician who lived in the Square, most likely to "fetch the doctor" to the dead or dying man. In this process we are assured that "Leicester Fields was astir with flumbeaux and coaches. Lords in ruffled clothes and crumpled periwigs were moving about with armed servants," &c., &c. These are capital "stage directions," but they are out of place where they are found. Peter the Great is the next "worthy," his right to be introduced consisting in the circumstance of his having been present on one occasion at a party given by Lord Caermarthen. This leads to a sketch of his career, and long stories about Evelyn and Deptford. Shortly afterwards Prince Eugene paid a still more flying visit to the Square, and is at once pounced upon as another worthy, and we are treated to a disquisition on the origin of the War of Succession, and the theory of the Balance of Power.

But we must hurry on to the immortal four whom it has been the pleasure of Mr. Albert Grant to select for particular commemoration. The house of Sir Isaac Newton is first brought

before us, and we are told of the company which did, as well as of the company which "may have," come under his roof. We are also told how, in the autumn of 1665, "to a new made Bachelor of Arts, sitting in his orchard, was revealed, in musing on the fall of the apple, the conception of the force that keeps the planets in their orbits," and so on for five-and-twenty pages, illustrated with woodcuts of Newton's telescope, his birthplace at Woolthorpe, and his rooms at Trinity! At last we get back to the house in St. Martin's Street, and are informed that it "had at least one eminent occupant in the same century. Dr. Martin Burney, a skilful organist, sound teacher of music, and a genial, busy, and intelligent man"; a description from which it is evident that old Charles Burney is meant, and not his grandson Martin, whose dirty hands while playing whist have been immortalized by Charles Lamb. Mr. Taylor refers with just admiration to Miss Burney's "Diaries," but he must be unacquainted with an earlier publication, though a much later composition—her *Memoirs of her father*—or else surely he would not have failed to quote the extraordinary description she gives of this house. In youth she had been conspicuous for the easy plainness of her style, but long residence in France had rusted her English, and caused her to write the most marvellous jargon that has ever found its way into print. "St. Martin's Street," she says, "was situated in the populous closeness of the midst of things," and, "though not narrow, except at its entrance from Leicester Square, was dirty, ill-built, and vulgarly peopled." Mr. Taylor ought also to have remembered that Macaulay has said "that few nobles could assemble in the most stately mansions of Grosvenor Square or St. James's Square a society so various and so brilliant as was sometimes to be found in Dr. Burney's cabin."

The chapter on the doings in Pennant's "Ponting-place of Princes" is perhaps the worst in the book. It is obviously framed on Thackeray's *Lectures on the Georges*, and not on an independent study of the memoirs, and diaries, and letters of the times. The author seems in particular to misunderstand Bubb Dodington, and, in imitation of Thackeray, casts off Leicester Square altogether, and crosses the sea to tell all about the murder of Count Konigsmark in distant Hanover. Gradually he works his way up to the erection of that equestrian statue of George I. which has caused so much merriment in recent years, but altogether omits to mention that the companion statue of George II. was put up at the same time, and still stands highly respected in the neighbouring open space of Golden Square. Here too he makes an utterly inexcusable blunder in asserting, as if it were a perfectly established fact, that Pope had accepted a gift of a thousand pounds from the Duke of Chandos not long before he satirized him under the name of "Timon." We stood amazed when we came to this, and referred to the *Life of Pope* by Dr. Carruthers, a work which we have always found as safe to quote as it is pleasant to read. We there found, indeed, that some one of the poet's many libellers had accused him of receiving five hundred pounds from the duke (half Mr. Taylor's sum), but that he had indignantly denied it, and, as the denial was made during the duke's lifetime, the accusation was utterly discredited. Mr. Taylor is evidently thinking about the money said to have been given by the Duchess of Marlborough to suppress the character of her husband: a vigorous bit of satire which is well known to be still in existence, and is destined to see the light before many months are over, when it will be found that "paper-sparing Pope" was equally careful not to waste his verses, and that some of the lines which were intended for Churchill, whom they hit very hard, had been diverted to Cromwell, against whom they are perfectly harmless. The next chapter, No. XII., is dedicated to "Hogarth at the 'Golden Head,'" where it is related that this golden head was made of "pieces of cork, cut, glued together, and gilded by Hogarth himself," without the slightest hint of the most important point, that the image was the likeness of Antony Vandyck. We then have the story related by the gossiping J. T. Smith of his father having once asked Barry the painter if he had ever seen Hogarth:—

"Yes, once," he replied, "I was walking with Joe Nollekens through Grandborne Alley, when he exclaimed, 'There, there's Hogarth.' 'What,' said I, 'that little man in the sky-blue coat?' Off I ran, and though I lost sight of him only for a moment or two, when I turned the corner into Castle Street, he was patting one of two quarrelling boys on the back, and, looking steadily at the expression in the toward's face, cried, 'D—n him! if I would take it of him; at him again!'"

This reads circumstantially enough, but a little consideration of dates will prove it to be altogether untrue. Nollekens went to Italy in 1760, and Barry did not arrive in London from Ireland till some time in 1764, the year of Hogarth's death, while Nollekens did not return from Italy till 1770. While on this subject, we may add that this same Smith says that he had "several times heard Mr. Nollekens observe that he frequently had seen Hogarth, when a young man, saunter round Leicester Fields with his master's sickly child hanging its head over his shoulder." Applying to this also the test of dates, Allan Cunningham showed that Hogarth was forty years old, and had been married eight years to Sir James Thornhill's daughter, when Nollekens was born. Yet Smith is now always described as the accurate and the scrupulous, and his works are a perfect quarry to all the bookmakers.

We have already perhaps said more than enough of Mr. Taylor's volume, but must yet add a few notes to justify our unfavourable opinion of it. We shall set them down perfectly at random. At p. 153 Locket's tavern is described as standing "near the site of George III.'s statue," whereas in truth it was close against the

present Admiralty, and built on ground which had once belonged to St. James's Park:—

The fate of things lies always in the dark,
What Cavalier would know St. James's Park?
For Locket's stands where gardens once did spring,
And wild ducks quack where gashoppers did sing.

It stood, in fact, in Buckingham Court, a passage which may still be found retaining the same name by any one who chooses to look for it. At page 375 we are told that the quarrel between Sir Joshua and the Academy "was connected with the election to an Associateship, as between Bonomi and Edwards." Now the quarrel took place in 1790, and Edwards was elected an Associate in 1773, seventeen years before. Had Mr. Taylor referred to his own *Life of Reynolds*, which we can very well understand his being unwilling to do, he would have found that the quarrel was about the election of a Professor of Perspective, the body of the Academicians wishing to nominate Edwards, whilst Reynolds was determined to force Bonomi upon them, first as an Associate, and then to the Professor's chair. At page 81 he talks of the two Minister brothers as the "Duke of Newcastle and Thomas Pelham," whereas we had always fancied that the Duke's name was Thomas, and his brother most certainly was always spoken of as Henry. At p. 109 there is a letter from Lord Leicester in which the receipt of 200*l.* is acknowledged for "three months' *lounge*" of the house in the Square. Lord Leicester had been three parts of his life on the Continent, and the word is evidently a misprint for "lounge." Mr. Taylor admits that he thought so himself at first, but has altered his mind, as "one can see a meaning in lounge, the payment for *lending* a house!" Of the misspelling of names, that fruitful source of confusion, there is no end. The Bristol Harveys are generally Harveys; Ozias Humphrey is Humphry; Sir James Mackintosh is Macintosh; Sir James Clerk of Pennycook is Sir Thomas; William Sharp, the engraver, is Sharpe; Miss Blandy, the murderess, is Miss Blaney; David Allan, the painter, is Allen; Foubert, the riding-master, after whom Foubert's Place is named, is Faubert; and Elliott, Lord Heathfield, is Elliott. Lastly, we can only make a guess at what is meant by saying that George II., when in England, kept his son within "the whiff and word" of his own temper.

An attempt to enumerate Mr. Taylor's sins of omission would require a separate article. But we must ask why no notice is taken of such eminent residents as Cayner and Talma, and Mary Tofts the rabbit-breeding woman of Godalming?

HADLEY'S ESSAYS.*

THIS is a volume of papers of a very high order from the pen of a lately deceased American scholar, whose name, we are ashamed to say, was unknown to us when we opened the book. Mr. Hadley was Professor of Greek in Yale College, and of his merits in that branch of study, as well as in some matters touching Latin and English, the present collection gives us good means of judging. But from Mr. Whitney's preface we learn that his studies took a much wider range than anything here would have led us to expect. Celtic philology and even Roman law are subjects not wholly foreign to some of the points discussed in this volume; but Mr. Whitney further tells us that in "mathematics he early displayed an ability that bid fair, if he had continued his devotion to it, to place him among the foremost men of the day in that branch of science." That he was, "in the opinion of all who know him most fully, America's best and soundest philologist," we can easily believe; he would have ranked among the best and soundest philologists anywhere. The subjects treated of in this volume do not, however, all come under the head of philology; some of them have a fair claim to come under the head of history so called. How well Mr. Hadley could state and weigh the arguments on both sides of a question is very clearly shown in the first paper in the volume, headed the "Ionians before the Ionian Migration," in which he discusses the theory—the wild theory we were half tempted to call it—of Ernst Curtius about Ionian settlements in Asia Minor and elsewhere ages before any of the dates commonly given to the migration from European Greece to Asia Minor. On this matter we spoke our own mind at no great length when we reviewed the first volume of Curtius's History. The paper, as here printed, consists of two—the first dated in 1856, soon after the first announcement of the theory of Curtius, the second in 1863, in which Mr. Hadley gives a summary of the controversy which the theory of Curtius has stirred up among the scholars of Germany. In this he states and balances the arguments on both sides with singular skill and fairness. Mr. Hadley's own conclusions, though they are not at all strongly expressed, seem to be distinctly opposed to the doctrine of Curtius. To our mind the theory seems to have nothing whatever to rest upon, and we read with great delight the remarks of Gutschmid, in which, though perhaps, as Mr. Hadley says, put forth with a needless degree of fierceness, he makes some good points against the theory of Curtius. Moreover Mr. Hadley well points out the way in which Curtius has changed his ground between the earlier and the later setting forth of his doctrine. To us it seems that—putting aside the supposed Egyptian evidence till it is placed before us in some form which will bring it within the reach of Western historical criticism—all the appear-

* *Essays Philological and Critical, selected from the Papers of James Hadley, LL.D.* London: Macmillan & Co.

ances which tell in favour of the Ionian theory of Curtius may be explained by the doctrine of the original and more distant kindred of the Greeks and the nations on the other side of the Aegean. Miletus in the Homeric Catalogue appears as Carian, and the Carians appear as a people of barbarous tongue; this is quite enough to show that Miletus was not inhabited by Ionians in any intelligible sense of that word; but it does not prove that the Carian occupants of Miletus were as far removed from the Greeks as the Phœnicians, or even as the Persians. If their tongue had parted off so far that they could not be understood in common discourse—that is, if they differed only as Englishmen, Danes, and High Germans, or as Italians, Spaniards, Provençals, and Frenchmen—their language would certainly be set down in Greek phrase as barbarian. Yet the original kindred would be not the less a real one, and it would not the less have the real effect of making a fusion of conquerors and conquered more easy than if they had been utterly alien to one another.

These two essays, which certainly have as good a right to be called historical as philological, are followed by some pieces more distinctly philological—"On the Root *prach* in Greek," "on the Greek Genitive as an Ablative Case," "on Bekker's digammated Homer." The one on the root *prach* has chiefly to do with the remarkable Greek word *πρασιος*. *Prach* in Sanscrit is held to be a compound of *pra* and *ich*, and Mr. Hadley sees the actual process of this formation in the Greek *προις* and its cognates. He also sees in Greek a solitary trace of the *prach* root in its compounded state, a cognate therefore of the Latin *precor* and *procius*, Old-English *fregman*, High-Dutch *fragen*, &c. Mr. Hadley casts aside the old derivation which brings *προις* from *πρ* and the root of *ερεω*, and follows Buttmann in deriving *πρασιος* from *ερεω* and *πριω*, but from *πριω* in a special sense in which it belongs to the *prach* root. It is, he allows, odd that a root which is so widely spread in the cognate languages should appear in Greek only in the shape of a single compound, which, as we have it, must have been "formed after the Greek language had assumed its distinctive character." He remarks that the accidental likeness between this *πριω* and *πριω* in its more common use may have helped to bring about the loss of the word in its rarer shape, and Mr. Hadley's Celtic learning supplies him with a parallel from the history of the same root in the Irish language:—

The Irish retains the root, but only in composition with a proper Irish prefix—a compound, therefore, which must have been formed after the language had assumed its distinctive character. From the Welsh it seems to have disappeared altogether.

In the paper which Mr. Hadley has given to Bekker's digammated Homer he goes very carefully through the various cases in which Bekker has introduced, or has declined to introduce, the lost consonant into the Homeric text. And thence he goes on to discuss the other theories, not nearly so well known, by which other scholars, as George Curtius and Ahrens, have held that the hiatus in Homer is sometimes caused by the loss of other letters besides the digamma, as *σ* and another letter answering to the German *j* or the English *y* consonant. But Mr. Hadley, after going through the examples quoted in behalf of these theories, rules that they are most rare and doubtful, while about the digamma there can be no doubt at all except as to particular cases of its use. Mr. Hadley then goes on to a paper as much musical as philological, "on Greek Rhythm and Metre," and thence to the eternal controversies about Greek accents and Greek pronunciation. With regard to the last question, the essay dated in 1870 has chiefly to do with a document referred to by Mr. A. J. Ellis as illustrating the pronunciation of Greek in the tenth century. On this document, in which an attempt was made by an ancient English, or more likely a Welsh, scribe, we said something in reviewing Mr. Ellis three years ago.* But it still seems to us strange that neither Mr. Ellis nor Mr. Hadley thought of comparing the Greek as written in Western characters by this unknown English or Welsh scholar with the Greek written in Western characters by the famous Liudprand. It is rather curious to see the way in which the natural strength of Mr. Hadley's mind, though he does not seem to have been very well versed in early English history, deals with Mr. Waring's feeble treatment of the historical side of the question about this document. Mr. Hadley pertinently asks what is the age of the manuscript. Mr. Waring says that it belongs to the latter half of the tenth century, on this ground:—

Now Mr. Waring observes that Eadgith, an Anglo-Saxon princess, married Otto I. of Germany in 930, and her son Otto II. married Theophania, a Greek princess, in 972. He supposes that "at the court of Otto a constant connection was kept up with the Anglo-Saxons and the Greeks, and thus a means was opened for the priests of the former to receive some tincture of Hellenic letters. We shall therefore hardly be wrong," he says, "in referring such transcriptions to the latter part of the tenth century."

"Eadgith, an Anglo-Saxon princess," is not quite the way in which a man who was much at home in the tenth century would speak of one of the sisters of Glorious Æthelstan, and he exposes himself further by fancying that Otto the Second was the son of his father's English wife. It was a great law that no Englishwoman could be both the wife and mother of an Emperor. Forgetting the existence of Archbishop Theodore, Mr. Waring argues that Englishmen of earlier days had no opportunity of learning any Greek. And to this he adds something about "the close connexion of Canute with Rome, and the subsequent Norman influence through Edward the Confessor," as making "a later date almost impossible." Mr. Hadley's natural sense enabled him to say,

"These historical reasonings do not seem to me to be very decisive," but he does not appear to have known enough of early English history to put Mr. Waring's confusions right. But he goes on to make some very valuable hints on the way in which the Greek is expressed in this manuscript, though at every step we lack the obvious comparison with Liudprand. Mr. Hadley is naturally surprised that the English *p* is never used for the Greek *θ*, but if the manuscript be Welsh, this is at once explained, as indeed Mr. Hadley himself remarks two pages after, when he seems inclined to believe that the manuscript is Welsh. This was the suggestion of Mr. Haddan, and every time we think about the matter it comes more home to us that Mr. Haddan was right in this as in most other things. Mr. Hadley's most curious remark is about the distinction which the scribe makes between *υ* and *ι*, of which he expresses *υ* by *y* and *ι* by *i*. But he also expresses the Greek *α* by *y*, which proves several things, as we remarked when we spoke about the matter three years ago. When this manuscript was written, *α* and *υ* must have been sounded alike; but they could not have been sounded as the Greeks sound them now, exactly the same as *ι*. The sound which is doubtless meant is the German *u*, a stage through which *α* and *υ* would naturally pass on their road to the modern sound of *ι*; and as Liudprand expresses *υ* by *y* and *α* by *i*, we have a further argument, first, that the change happened faster with *α* than it did with *υ*, and, secondly, that this manuscript is older than Liudprand. Nor does it make much difference that in the modern Welsh spelling the modern *y* has not the sound of *u*—sometimes of English *u*, sometimes of *i*: for the old Welsh spelling differs a good deal from the modern, and the *i* sound in the final syllables seems to show that the Welsh *y* has in those cases passed through the *u* stage. But the most curious thing of all is that Mr. Hadley here brings to bear certain statements of the old Greek grammarians by which it is plain that in the fourth century of our era *α* and *υ* were sounded the same, and differently from *ι*. And more remarkably than all Mr. Hadley adds:—

It is a curious fact that this pronunciation of *α* appeared among the Boeotians several centuries before the Christian era, as in *τῷ δῶλῳ* for *τῷ δῶλῳ*, *ἐντα* for *οἷα*. What adds to the wonder is, that the changes in *α* and *υ* should have been likewise anticipated among the Boeotians: as in *ὑπάκουσθαι*, Boeotic for *ὑπακούσαι*; *ἴν*, Boeotic for *ἴμ*. The Boeotians, backward as their Athenian neighbors thought them, were certainly, as regards pronunciation, in advance of their age.

The next paper, headed "Ross on Italicans and Greeks," shows that Mr. Hadley, among his other gifts, was in no small degree master of the art of sarcasm. Professor Ross of Halle, well known as a traveller in Greece, writes as lately as 1856 a tract with the heading, "Sprachen die Römer Sanskrit oder Griechisch?" The notion that nothing can simply be itself, but that everything must be "derived" from something, the notion that the object of Comparative Philology is to "derive" Greek or anything else from Sanskrit, is one which we have always to be fighting against; but we should hardly have looked for it, within the last twenty years, in one who, like Professor Ross, certainly is a scholar in the narrower sense. But here is the case of such a one who, so short a time ago, was not satisfied with the facts that the Romans spoke Latin, that Latin is a tongue akin both to the Greek and to the Sanskrit, but much more nearly akin to the Greek, but who mocks at any connexion with Sanskrit altogether, and seriously sets himself to prove that Latin is "derived" from Greek, or rather that it is a corrupt dialect of Greek. Another doctrine of Professor Ross is that the modern Greek pronunciation is not only of the respectable antiquity which it undoubtedly is, but that it is a thing which has been unchanged from the beginning, and which Professor Ross thinks represents the pronunciation of Homer or of anybody before Homer. As for his Latin, Professor Ross believes that *consul* is a corruption of *συνβουλος*, and *junius* of *ἰνδρινος*, derivations which, as Mr. Hadley truly says, sound like burlesques invented by an enemy. But this last derivation leads the way for a skilful remark of Mr. Hadley that, while the *ζ* in such a word as *ζυγόν* could not possibly change into the *j* = *y* of *jugum*, the change the other way is very easy. *Ζυγόν*, of course, is a later form than the Latin *jugum* and our *geor*, *yoke*, or *joch*. Yet it sounds strange in the middle of this to find such a sentence as the following:—"The Scottish *bane* is not necessarily derived from the English *bone*, in fact there is no reasonable doubt that both have arisen independently from the Anglo-Saxon *bán*." It is odd that Mr. Hadley should not have learned to speak of his own language in the same scientific way in which he speaks of all others. Yet there are several papers of a high kind on English matters in Mr. Hadley's volume, some of them on subjects of which we have sometimes spoken ourselves, as several questions arising out of the great work of Mr. A. J. Ellis, and one on Mr. Manning's queer notions about the English genitive. There are also a good many shorter and more miscellaneous papers, one or two on Biblical subjects, and one or two containing good advice to the students of Yale College, especially the most sound and practical doctrine that those who read and write much ought to eat a good deal to make up. And he adds the no less necessary rule that they ought also to take a good deal of exercise. We can almost fancy that we see the results of an observance of these precepts in the manly and hearty tone of Mr. Hadley's own writings.

CHATEAUBRIAND.*

(First notice.)

THE literature of criticism is not generally so permanent as the literature of creation. Although quantities of novels and poems are published every year for which nobody but their authors would predict any but the most ephemeral existence, still the novelist or poet who really possesses the gifts of nature which are necessary to good quality of workmanship has much better chances of duration than the critic of equal relative culture and capacity. Yet there is an art of criticism, the higher or highest art of criticism, which may produce a kind of literature that may survive at least the lifetime of its authors; and of all critics who have ever written upon their contemporaries, Sainte-Beuve possessed in the highest degree the qualities which ensure the lasting esteem of the cultivated class. New editions of his writings will therefore probably continue to be published, until either the reading public so generally attains his level that he will appear no longer eminent, or else until new views of literature become fashionable, of a nature incompatible with continued deference to his own. It is difficult to believe that either of these contingencies can be very near. A critic of Sainte-Beuve's combined delicacy and acuteness of perception is a rarer phenomenon in the intellectual world than a poet of great imaginative force; so that it is in the highest degree improbable that the public generally, even though taught by the critic himself, will ever arrive at an equality with him in this respect; whilst, on the other hand, new fashions in literature, being, like all mere fashions, transitory, will not have time to overthrow a system of criticism that was simply a development of permanent good sense. The most serious danger to the duration of critical writings equal in quality to Sainte-Beuve's is that the books and persons that formed their subjects may not continue for very long to attract the attention of posterity. This, however, is not likely to affect the volumes before us, which relate to a personage of the greatest importance in the last generation, and to the interesting group of literary people who surrounded him.

The origin of considerable undertakings may often be traced to some very trivial incident; and Sainte-Beuve, in his introduction, tells a curious story about something that happened to him in Paris, and that led to a temporary exile in which he composed this essay, first delivered in the form of lectures to a class of students in Belgium. In October 1847 he occupied a lodging in the Institute; being one of the librarians of the Mazarine Library, and in this lodging he was troubled with a smoky chimney. To repair this chimney was the duty of the French Government, so Sainte-Beuve addressed himself to the Minister, the repairs were executed, and he thought no more of the matter. Then came the Revolution of 1848, and lists were made out, from the accounts of the preceding régime, of people who had received public money. There was a rumour that Sainte-Beuve was one of these people—that he had received at various times sums of considerable importance. He denied this indignantly in the *Journal des Débats*, and did what he could to have the accusation put into a definite shape, with evidence. At the same time, and on account of this accusation, he resigned his place of librarian at the Mazarine. Now Sainte-Beuve had an enemy called Génin, and this M. Génin was convinced that an article of his had been refused by the *Revue des Deux Mondes* on account of Sainte-Beuve's interference, so he spread the rumour about public moneys. At that time it was not easy for a man of letters to live in Paris by such labours as Sainte-Beuve's, and therefore he went to Belgium, where he delivered the course of lectures which formed the basis of the work before us. The mystery of the public moneys was cleared up afterwards. All that could be brought forward in the way of definite evidence was this entry:—"M. Sainte-Beuve, 100 francs." Suddenly he remembered the smoky chimney, which must have cost about that sum to cure its evil habit. And so, because a chimney smoked, Sainte-Beuve had been exposed to a calumnious accusation, had been obliged to make a public fuss about his honour, to resign his office of librarian, to go to Belgium, to deliver lectures; and if the chimney had not smoked, this book would never have been written. Such is the mystery of cause and effect in the affairs of men; but it is probable that, although smoky chimneys may have frequently interfered with the production of a good book, by spoiling temper and eyesight, they have never in any previous instance directly led to it.

No one more than Sainte-Beuve recognized the necessity for a high court of appeal in matters of intellectual culture—some great prince, or circle, or an enlightened public opinion—and under the Directory there was no efficient influence of this kind. The turmoil of revolutions is hostile to the production of thoughtful or finished literature, and men hear only the echo of the great noise:—

En somme, il ne se fit point, il ne put point se faire de grandes œuvres, de grandes compositions littéraires durant les dix années ardentes de la Révolution. La tribune eut ses moments de tonnerre et d'éclat, la scène eut ses soirées brillantes, comme la presse eut ses pamphlets du matin. Ces sortes d'œuvres n'excèdent pas le degré de suite et d'attention que permettent les circonstances. On peut avoir le *Philinte* de Fabre d'Églantine, le *jeune Cordelier* de Camille Desmoulins, et même l'*Agamemnon* de Lemercier; on ne se met pas à écrire l'*Esprit des Lois* sous la Constituante ni sous le Directoire; ou si on se mettait à l'écrire, la plume tomberait des mains bien des fois, et il y aurait tel moment de désespoir où l'on jetterait au feu le manuscrit.

* Chateaubriand et son groupe littéraire sous l'Empire. Par Sainte-Beuve. Nouvelle édition. Paris: Lévy.

Sainte-Beuve thought it possible for men absorbed in scientific pursuits to forget the tumult around them, and absorb themselves in labours having no reference to the events that take place upon the surface of the earth; but the writer deals with material too human in its nature for such isolation to be possible in his case; and he cannot write well whilst the great drama is being acted before his eyes—he must wait till the lava has cooled before he can employ it as material. After giving a list of the literary men of that time, he says that each of them lived (in his literature) from hand to mouth, improvising, and stitching together whatever was dictated by the spirit of party or by necessity:—

Pour qu'une littérature ait de la vie avec ensemble et consistance, il faut une certaine stabilité non stagnante; il faut, pour l'émulation, un cercle de juges compétents et d'élite, quelque chose ou quelqu'un qui organise, qui régularise, qui modère et qui contienne, que l'écrivain ait en vue et qu'il désire de satisfaire; sans quoi il s'émancipe outre mesure, il se disperse et s'abandonne. Au dix-septième siècle on avait eu Richelieu; on avait eu Louis XIV aidé de Boileau. Au dix-huitième siècle on avait la société, l'Opinion, cette reine d'alors. Les grands siècles littéraires ont toujours eu ainsi un juge, un tribunal dispensateur, de qui l'écrivain se sentait dépendre, quelque façon, ou pour parler comme La Bruyère, quelque *baïastre*, duquel descendait la palme et la récompense.

However, even in the Revolution itself some had hopes, which more recent experience has proved to be not altogether unfounded, that liberty might regenerate the arts and give them new life and vigour. Daunou made a speech in this sense, which Sainte-Beuve quotes with a note of his own, written in 1849, in which he expresses doubts about the compatibility of taste with liberty, and seems to prefer a certain restriction, believing even that the censure of the press, like rhyme, may be profitable to thought by hampering it, and forcing it to use a certain ingenuity by which it finds good things which in a time of perfect liberty it would never have troubled itself to seek for. In an appendix to this note (written much later) Sainte-Beuve, speaking only with reference to taste in literature, expresses the opinion that the restrictions of the Second Empire were decidedly favourable to certain writers, who, in consequence of it, were able to convey the impression that they would have displayed great talents if they had not been so much hampered, and he gives M. Prévost-Paradol as an example. This same Daunou, in reply to a deputation from the Institute, said that "il n'y a de génie que dans une âme républicaine," which is exactly the reverse of what M. de Bonald asserted when he affirmed that the genius of letters could only come to perfection under a monarchy. Madame de Staël thought that the Revolution might ultimately enlighten a greater number of men, but that during several years the vulgarity of language and manners must cause taste and reason to retrograde in many ways. Sainte-Beuve recognizes the justice of this apprehension, and regrets the tendency of modern writers (which springs from a commercial necessity) to look rather to the number than to the distinction of their readers, "de vouloir la grosse gloire plutôt que la grande."

After the noise and discomfort of the Revolution, in which so many minds had been for long deprived of the tranquil enjoyment of their own ideal, Chateaubriand came with his *imagination catholique* and a certain charm which was exactly what the wearied souls of that time were hungering and thirsting for after the blood and dust of an unparalleled social convulsion. Sainte-Beuve calls both Fontanes and Chateaubriand "des épicuriens qui avaient l'imagination catholique," and heads, with great knowledge of human nature, especially of French human nature, "Il y a des hommes qui ont ainsi l'imagination catholique indépendamment du fond de la croyance. Les pompes du culte, la solennité des fêtes, l'harmonie des chants, l'ordre des cérémonies, l'encens, le rayon mystérieux du sanctuaire, tout cet ensemble les touche et les émeut." Fontanes predicted the kind of writer who was destined to supply the peculiar need of the time. He suggested that a writer who would prove the utility of religious opinions ought to have a style worthy of the subject:—

L'élevation et la sensibilité y domineraient, mais sans faste et sans effort. C'est la qu'on aimerait cette heureuse suite de mouvements et de raisonnements qui forment l'éloquence: car dans un tel ouvrage il faudrait à tour forcer la conviction et parler à l'enthousiasme. Le charme, qui persuade, y serait peut-être plus nécessaire que la logique victorieuse, qui subjugue la raison. C'est donc à une âme douce, plutôt qu'à une âme fière, qu'il appartient d'écrire sur les opinions religieuses. Ce livre important reste encore à faire: il mérite un grand écrivain.

The "grand écrivain" appeared in the person of Chateaubriand. As Vinet said of him, "Après tant de dissertations et d'analyses, il sentit qu'il fallait chanter, et il chanta":—

Il chanta [says Sainte-Beuve] les sujets éternels qu'une éclipse funèbre avait trop longtemps voilés, que la persécution et le martyre avaient rajeunis—les pompes religieuses et sociales qu'il égalait, en les retraçant, par la splendeur de ses tableaux, et sous lesquelles il introduisait (au risque d'en altérer l'esprit) je ne sais quoi d'ému, de sensible, et même de troublant, qui les rendait plus mystérieuses encore et plus chères. Il combina, par un mélange hardi et où les contrastes choquaient moins qu'ils n'éblouissaient, la poésie de l'antiquité dont il était plein avec une poésie toute nouvelle du moyen-âge, et aussi avec une peinture merveilleuse des scènes naturelles immenses, auxquelles les derniers grands écrivains eux-mêmes n'avaient point accoutumé. Ce fond si dissimulable, et qui n'aurait point supporté le regard du froid examen, mais si admirablement revêtu, saisit à l'instant les imaginations lassées et altérées, qui voulaient à la fois retrouver, adorer ce qui leur était cher, et le retrouver cependant sous une forme légèrement inconnue. De là son succès, qui donna le signal d'une renaissance, et qui ressemblait tout ensemble à une reprise de possession du passé, et à une marche en pompe vers l'avenir.

The basis of Chateaubriand's character, in what directly affected his literary career, appears to have been an incurable *cnnui*. "Je crois," he said, "que je me suis ennuyé dès le ventre de ma mère." It was a sort of malady which became epidemic

amongst the *élite* of that time, especially amongst the younger and more sensitive. The French call it *le mal de René*, Chateaubriand's hero, but a similar state of feeling was experienced and propagated by the author of *Childe Harold*. It was capable of highly poetical expression, and was at that time taken to be nothing less than poetry itself. Byron and Chateaubriand were poets who found this tone a good dominant tone to work in, because it gave full scope to dissatisfied aspiration, and to that vague "longing after the infinite" which even the most practical people experience when realities disappoint them. In external nature Byron found the vastness and monotony of the ocean an harmonious illustration of this spirit, whilst Chateaubriand found his illustration in the great forests of America. Both of them had, in addition to this perpetual *ennui*, a source of inspiration in the ardent sensuousness of youth. Sainte-Beuve believes, however, that in the literature which Chateaubriand produced there exists a visible mark of decadence, not of personal but of general decadence, in the absence of interior harmony between what is really and what is only ostensibly the source of inspiration. For example, Chateaubriand goes to Jerusalem, and is supposed to go there to visit the holy places as a pilgrim, but he confessed later that he went in an entirely different spirit. He talks about leaving the port of Deademona and Othello, which is his un-pilgrim-like manner of designating Venice, not to carry his repentance to the tomb of Christ, but in order to find the materials which might bring him fame, and through fame, love. There was a lady, it appears, in Spain, and this lady's bower was the last stage of the pilgrim's tedious course, and that which was oftenest in his thoughts. The project of playing upon people's religious sensibilities in order, first to win a brilliant notoriety, and then, by means of that notoriety, to dazzle the minds of women, is a project strikingly incompatible with that singleness of moral and intellectual purpose which belongs to the ideal either of pilgrimage or of authorship. A desire for success with the fair sex was to the last one of the ruling motives of Chateaubriand, and it was this which made him so ill endure the idea of growing old. We cannot positively affirm, though we may imagine, how Byron would have supported the approaches of old age, but what we only guess in the case of Childe Harold, we know in the case of René:—

Ceux qui l'ont connu savent qu'il n'a jamais pu se consoler de vieillir, qu'il n'y a jamais consenti; il a pris la vieillesse comme un simple affront, et nul n'a mérité si bruyamment le deuil de la jeunesse; il était, à ce sujet, comme ces rois d'Asie qui, de colère, déchirent leurs vêtements.

Sainte-Beuve thinks that the chemistry of Chateaubriand's nature was compounded of these elements:—

d'une part, l'ennui sauvage, avide, insatiable, comme base et comme fond; d'autre part, sillonnant ce vague *ennui*, l'éclair idéal, électrique, du désir; et l'honneur seul, l'honneur chevaleresque, pour tenir et maîtriser tout cela.

This sentiment of honour in Chateaubriand was a tradition of the old French noblesse. Sainte-Beuve defines or describes it very accurately in a few words:—

On est prodigue, libéral, plein d'éclat et de noblesse; on s'expose, on se sacrifie un moment; mais à ce prix on se passe bien des passions et tous ses caprices. Du moins il y a là un ressort puissant, quelque chose qui se révolte contre toute lâcheté, contre toute cupidité sordide, contre toute bassesse. Dans un temps dont M. Royer-Collard disait: "L'abaissement éclate de toutes parts," il y a là du moins quelque chose qui ne vous rabaisse pas.

Add to these characteristics an immense imaginative energy, with a remarkable literary power that captivated great multitudes of readers, and you have what was most essential in the nature of Chateaubriand. His words fixed themselves and produced lasting effects:—"Ses paroles ont avec elles un mordant qui les grave; il a ce genre d'amertume qui accompagne la force." He had an intense sense of some aspects of external nature, which in his day was nearly new in French literature, and he made a great literary discovery, that of the vast solitudes of Transatlantic forests. This delight in the grandeur of wild nature seldom, however, long survives the period of early manhood, unless sustained, as it was in the case of De Saussure, by persistent scientific studies, or else, as in that of professional landscape-painters, by an interest in the endless problems of art. Several years after *Atala* was written, Chateaubriand travelled in Italy, and perceived that his feeling for the sublimity of external nature had lost much of its early intensity. Writing to his friend M. de Fontanes, he expressed this difference as he felt it, and the passage is worth quoting for the light it throws upon a change which had been observed in others, but which is peculiarly interesting in Chateaubriand, who had gone much further than most of his contemporaries in the landscape-enthusiasm of the age:—

Aujourd'hui je m'aperçois que je suis beaucoup moins sensible à ces charmes de la nature; je doute que la Cataracte de Niagara me cause la même admiration qu'autrefois. Quand on est très-jeune, la nature muette parle beaucoup; il y a surabondance dans l'homme; tout son avenir est devant lui; il espère communiquer ses sensations au monde et il se nourrit de mille chimères. Mais dans un âge avancé, lorsque la perspective que nous avions devant nous passe derrière, que nous sommes détrempés sur une foule d'illusions, alors la nature seule devient plus froide et moins parlante; les jardins parlent peu. Pour que cette nature nous intéresse encore, il faut qu'il s'y attache des souvenirs de la société: nous nous suffisons moins à nous-mêmes; la solitude absolue nous pèse, et nous avons besoin de ces conversations qui se font le soir à voix basse entre les amis.

Chateaubriand's manner of composition was exactly the opposite of Wordsworth's, for he could only work or compose whilst actually holding the pen between his fingers. He said himself that he never even thought about his writings when not seated

at his desk. However, when he did sit down, it was for a long sitting, often for a sitting of twelve or fourteen hours at a stretch. Sainte-Beuve accounts for this by the nature of Chateaubriand's intellectual performance, in which there was no continuous development of reasoning. His literary work was nothing but a series of recommencements, brilliant, but broken. There was no regular flow of discourse, but only a multitude of sparks. Sainte-Beuve appears to think that a more continuous mental process would have been apt to go on of itself at other times also. Rousseau, on the other hand, said that he never was able to compose pen in hand, but wrote in his own brain when he walked out in the woods, or lay in bed during long sleepless nights. Chateaubriand read largely, but with a view to his own subsequent literary performances, not simply for reading's sake. He had not the serious qualities of the historian, but possessed one quality, valuable above all others to a man of letters, which Joubert well defined in a letter to Madame de Beaumont:—

Ce livre-ci (*Atala*) n'est point un livre comme un autre. Son prix ne dépend point de sa matière, qui sera cependant regardée par les uns comme son mérite, et par les autres comme son défaut; il ne dépend pas même de sa forme, objet plus important, et où les bons juges trouveront peut-être à reprendre, mais ne trouveront rien à désirer. Pourquoi? Parce que, pour être content, le goût n'a pas besoin de trouver la perfection. Il y a un charme, un talisman qui tient aux doigts de l'écrivain. Il l'aura mis partout, parce qu'il a tout manié, et partout où sera ce charme, cette empreinte, ce caractère, là sera aussi un plaisir dont l'esprit sera satisfait. Je voudrais avoir le temps de vous expliquer tout cela, et de vous le faire sentir pour chasser vos poltronneries; mais je n'ai qu'un moment à vous donner aujourd'hui, et je ne veux pas différer de vous dire combien vous êtes peu raisonnable dans vos défiances. Le livre est fait, et par conséquent le moment critique est passé. Il réussira, parce qu'il est de l'Enchanter.

The italics in this quotation are Sainte-Beuve's, who fully endorses the opinion of Joubert, and adds to it in a note a passage from Eugène Delacroix (the painter), who said that nature had given to each special talent a peculiar talisman of its own. Sainte-Beuve says that without talisman there is no charm, and that when this is wanting there may be labour, effort, merit, whatever belongs to criticism, but there is neither magic nor poetry. Here he touches upon what most deeply concerns all workers in the higher literature, and all artists whatever. Have they the talisman? this, for them, is the main question. If they have it, the world will pardon many deficiencies and many inaccuracies, but if they have it not they labour vainly. What the talisman precisely is it might be more difficult to define, for it is a thing to be felt rather than explained; but it clearly indicates sympathy, and a certain strength of imagination, working in harmony with some strength of feeling in the public that desires a high excitement. We must not forget that the talisman depends for its magical effects quite as much upon the state of the public mind as on the mind of the magician himself. Chateaubriand was fortunate in having the talisman, but he was fortunate also in a public which eagerly desired the very kind of excitement he was able to produce. Great numbers of his countrymen longed for certain emotional conditions from which the Revolution had severed them, and the writings of Chateaubriand gave them the emotion which they needed. To us, who read the *Gospel of Christianity* with other eyes, it may be not readily conceivable that it brought so much consolation to a weary and hardly-used race of men. But so it was. The book came to them like an angel's gift, and they exalted the giver of it to a level with the great religious and moral benefactors of mankind. He lived to see the fading of some of these illusions, yet he always bore, and has left behind him, one of the most famous names in literature.

THE SPEAKER'S COMMENTARY.*

SINCE our last notice of this work little progress has been made towards its completion. One more volume indeed has appeared, bringing down the Commentary to the Song of Solomon. But it is to be feared that the Revision of the Text at the hands of the two "Companies" will be presented to the public before the *Speaker's Commentary* is finished.

We had occasion, in speaking of the second volume of this series, to call attention to the marked superiority of the critical matter supplied by Canon Rawlinson of Canterbury over the contributions of some of his colleagues in the work of exegesis. The whole of the third volume, which we now proceed to notice, is by the hand of the same competent scholar and critic. We find no reason to alter our former favourable judgment after considering the introductory essays and the running annotations which Mr. Rawlinson has provided for the Second Book of the Kings, the First and Second Book of the Chronicles, and the Books of Ezra, Nehemiah, and Esther. Once more, however, we have to renew our complaint of the dryness and poverty of spiritual interpretation in this Commentary as a whole. It will continue to be a book of some permanent value, to be consulted in cases of obscurity in difficult passages; though, as a devotional guide, helping the reader to the deeper senses and inner life of the Scriptures, it is altogether useless. But what is really wanted, and what this Commentary was intended (as we imagine) to supply, is an explanation for popular use of the general scheme of the written Revelation as a whole, interpreted by the one key to Scripture—

* The Holy Bible according to the Authorized Version (A.D. 1611); with an Explanatory and Critical Commentary, and a Revision of the Translation, by Bishops and other Clergy of the Anglican Church. Edited by F. C. Cook, M.A., Canon of Exeter. Vol. III. 2 Kings—Esther. London: John Murray. 1873.

namely, the Person and Office of the Messiah. For anything of this sort the reader will look to these pages in vain. Take, for instance, the two Books of the Kings. They are treated solely as dry historical annals. But a very thoughtful living theologian, Mr. Andrew Jukes—who is, we believe, a Nonconformist—has published, under the title of *The Mystery of the Kingdom*, a much more profound view of the religious value of these historical books, which is not even noticed by the commentators whose joint work is now before us.

Canon Rawlinson is most in his element, we think, when he brings to bear on the sacred text the results of his own and his brother's distinguished historical and linguistic scholarship in the fields of Oriental literature. We turned with interest to see what reference would be made to the famous Moabite Stone discovered in 1869, in connexion with the Mesha, mentioned in the third chapter of 2 Kings. An "additional note," on the bearing of this Moabite stone upon the Jewish history, did not disappoint us. It would have been well perhaps if Mr. Rawlinson had given the text of the Moabite inscription, or at least some exact reference to where it might be found. But the absence of exact reference is one of the most conspicuous defects of the *Speaker's Commentary*. There was great value in the books of older scholars in the list always given of the particular editions of all the works quoted or referred to. A book is almost useless to students which does not give precise references. In the place before us Mr. Rawlinson sets out fairly the arguments for the two possible dates of the Moabite inscription, without telling us which of the two he himself adopts. But he sums up ably the points established and the doubtful conclusions suggested by the inscription. Among the former the two most remarkable, excepting, of course, the value of the incidental testimony to the Scripture history, are the facts that the God of the Israelites was known to the Moabites under the quadriliteral name which we pronounce "Jehovah," and that there was a sanctuary of the true God at Nebo, in the Trans-Jordanic territory, where sacred "vessels" were used in His service and worship. We agree with Mr. Rawlinson in his conclusion that this remarkable inscription does not prove that the Moabites had at any time made any considerable progress in civilization or in intellectual culture. We may here point out another confirmation of the Hebrew records by contemporary history, in the fact, first noticed by the present commentator, that the only record of that "war of independence" in which Naaman (2 Kings, v. 1) became distinguished is supplied by the Assyrian monuments. A very valuable note, from the acquaintance which it shows with the Assyrian monumental records, is appended to 2 Kings, xv. 19, the passage in which the first mention occurs in Scripture of Assyria as an aggressive power. The monuments of Nineveh are also made of great use in illustrating the military preparations of Sennacherib against Hezekiah.

Leaving questions the interest of which is mainly historical, we notice much to commend in Canon Rawlinson's scattered notes on the character and work of the prophet Elisha. We regret that he did not combine in one dissertation his view of this prophet's life and mission. But if the notes on the chapters which relate his history are read consecutively—which few, we fear, are likely to do—a very lifelike picture of the prophet will be obtained. For example, the "double portion" of his master's spirit which Elisha prayed for is well explained. Then there is a valuable hint, from the history of the Shunamite, that the prophet must have maintained regular services on Mount Carmel, "new moons and sabbaths," for the benefit of those who were still faithful in the northern kingdom. Again, we notice a sensible note on the "trivial character" of some of Elisha's miracles, which we may perhaps advantageously transcribe:—

We are apt not to be satisfied unless there is clearly seen by us to be a "dignus vindice nodus" in each case of miraculous interposition. But we really know very little as to the laws which govern the exercise of miraculous powers, where such powers have been committed by God to a mere mortal. It is possible that they may sometimes, like natural gifts, be so much under their possessor's control that he can exercise them or not exercise them at pleasure. And it may depend on his discretion whether they are exercised in important cases only or in trivial cases also. Elisha had evidently great kindness of heart. He could not see a grief without wishing to remedy it. And it seems as if he had sometimes used his miraculous power in pure good nature, when no natural way of remedying an evil presented itself.

We proceed to notice some improved translations—but there are few of them. Such, for instance, is the speech of Hazael, "But what is thy servant, this dog, that he should do this great thing," which has quite a different meaning from that given by the common rendering. Such again is the description of Elisha's long and meaning look at Hazael which detected the guilty thought in the King's mind. "Elisha settled his countenance and set it (towards Hazael) till he (Hazael) was ashamed." Then again we find many apt illustrations from Oriental manners and customs. Thus Jezebel "put her eyes in antimony," which is the literal rendering of the words translated "painted her face." So when Ahaziah's brethren were slain "at the pit of the shearing-house," properly "at the well of Beth-Eked," we are reminded that, as at the massacre of Mizpah mentioned by Jeremiah, and at that of Cawnpore in our own recent Indian history, a well furnished a convenient receptacle for the murdered victims. We have no space for Canon Rawlinson's statesmanlike sketch of Jehu's character and policy, nor for an able note in which he disposes of all the fanciful books written to identify the lost Ten Tribes with any existing race or body of persons as nothing better than "ingenious exercises."

The Introductory Remarks on the Books of the Chronicles are very masterly. The author is inclined to prefer to the common title the LXX. title of *Paraleipomena*, or "Things Omitted." He considers that these books were written by Ezra after the Return from the Captivity; not however merely or chiefly to supply what had been left out in Samuel or the Kings, but rather "with an immediate practical object, that of meeting the peculiar difficulties of his own day." Accordingly, he calls attention throughout to the Levitical spirit shown by the author. In other words, the main object of these books was to instruct the returned Israelites in the routine and meaning and political, as well as religious, value of the Temple Services. It is high but deserved praise to say of this particular Introduction that it tells the reader pretty nearly all that he wants to know as to the authorship, date, and purpose of these books. The text of the Chronicles is corrupt, and the meaning often obscure; but they are of great interest and value. It is a very great advantage to church-goers that the New Lctionary of the Church of England has selected for public reading several chapters from these somewhat undervalued books. For instance, much additional information is given in 1 Chron. xxi. as to David's numbering of the people and its consequences, and as to the sacrifice at the threshing-floor of Araunah, otherwise Ornan. There is a whole mine of buried knowledge as to ancient music in the fifteenth chapter of the First Book, which describes David's ordinances for the choral worship of the Tabernacle and the Temple. Mr. Rawlinson has not brought any special technical knowledge to bear on this subject; but it would reward, we are convinced, the research of a competent musician. We do not find that in the following volume the musical directions in the headings of the Psalms receive any adequate explanation. Mr. Rawlinson, in commenting upon the skill of Hiram of Tyre, who was sent to Solomon for the building of the Temple, aptly compares with his versatility in art the examples of Theodore, the Samian, in early history, and of Michael Angelo in more modern times. There can be no doubt that no artist can be of the highest force whose skill is restricted to one branch of art only.

There is much that is of great interest and value in Mr. Rawlinson's annotations on the short books of Ezra, Nehemiah, and Esther. But we demur to a note on Ezra vi. 10, in which "the sacrifices of sweet savour" are explained as probably meaning nothing but offerings of incense. Surely the animals mentioned in the preceding verse, together with wheat, salt, wine, and oil, which the decree of Darius ordered to be provided day by day for the burnt-offerings, points out that the passage refers to the burnt-offerings, and meat-offerings, and peace-offerings of the Law. Does not Mr. Rawlinson remember that sin-offerings and trespass-offerings were the only ones which were *not* sacrifices "of sweet savour"? We notice, on Ezra vii. 6, a valuable note on the scribes, of whom we read so much in the Gospels. Our commentator thinks that the professional scribes, who were students, interpreters, and copyists of the Law, did not exist as a class till after the Captivity, when it became of importance to retain a knowledge of the old dialect then beginning to disappear in common speech. An acute note on Nehemiah ii. 19, wherein "Geshem the Arabian" is mentioned as an ally of Sanballat and Tobiah, reminds us that the recent discovery of the fact that Sargon peopled Samaria in part with an Arab colony explains the presence of a man of that nationality among the enemies of the returned Hebrews.

We note, in conclusion, two valuable appendices on certain Persian words in Ezra and in Esther. Mr. Rawlinson identifies the Akhasverosh (Ahasuerus) of Ezra with the Persian Khsayarsha, which the Greeks and Romans abbreviated into Xerxes. The name Esther, which some have tried to connect with the Greek *aster*, a star, seems rather to be the Persian equivalent of Hadassah, the Hebrew word for myrtle, and thus to answer to the Greek name *myrica*.

The following volume, the fourth, which contains Job, the Psalms, the Proverbs, Ecclesiastes, and the Canticles, is the work of several writers. We hope to recur to it on a future occasion.

SCOTCH SONG AND SCOTCH CHARACTER.*

IF Professor Clark Murray wished to say anything of interest about the ballads of Scotland, it is a pity that he allowed himself to be trammelled by the conditions of the St. Andrew's Society of Glasgow. It seems that the Society offered a prize for an essay about the effects of the Scottish ballads on the character of the people. Now no one can be better aware than Dr. Clark Murray that national songs have a very moderate influence on national character. It is the genius of a people that produces its popular poetry, and the poetry only slightly reacts upon the genius. Historical ballads, for instance, telling of the exploits of patriots, keep up a spirit of national independence. Thus the *tragedies* of the Romaic klephts foster hatred of the Turk and of the tourist, just as "Scots wha hae wi' Wallace" refreshes the Caledonian's contempt for the cockney. In the same way ballads of superstition aid the survival of primitive beliefs. The Nereids might have been forgotten in Greece, the fairies in Tweeddale, if popular songs had not kept them alive in the popular memory. Again the drinking chants in which Scotland is so rich do much to benefit the revenue,

* *The Ballads and Songs of Scotland*. By J. Clark Murray. London: Macmillan & Co. 1874.

Scotch Song. By Mary Carlyle Aitken. London: Macmillan & Co. 1874.

and to stereotype the national love of whisky. But these influences, in spite of Fletcher of Saltoun's "very wise man," who was so anxious to make the ballads of a nation, is nearly all that popular song possesses. The Scot is patriotic, superstitious, thirsty, sometimes sentimental, and these qualities produced the Scotch ballads, and the ballads rather help to keep the qualities in high esteem. And that is almost all that needs to be said on this subject. Dr. Clark Murray admits this:—"A certain type of character, for example, cannot be due to the agency of the people's songs alone, for the people's songs are, in the first instance, due to its character." And here is the ground of our complaint against Dr. Murray. He has made the limits imposed on him by the St. Andrew's Society of Glasgow an excuse for writing a book which far outruns these limits, without adding anything to our knowledge on disputed points of ballad lore. The antiquity of the Scottish folk-songs, the manner of their production, the kind of society from which they sprang, the changes which oral tradition has produced in their original forms, their relation to the ballads of other countries are all matters which Dr. Murray leaves obscure. He thinks that he is deterred from the use of the comparative method by the very nature of his task:—"In order to estimate the amount of the influence which the songs of Scotland have been exerting on the life of her people, it is not necessary to hazard any comparison between these songs and those of any other country, even though such a comparison need not be dreaded by the most patriotic Scotsman." It would do the most patriotic Scotsman no harm to learn that other nations possess a volume of popular song much fuller, more graceful, and more musical than his own. And it is only by finding out in what respects Scotch ballads agree with and differ from the poetry of other nations that he can discover in what way they may have helped to produce that fine flower, the Scotch national character.

It has long been known, if we may attempt the comparison which Dr. Murray neglects, that many traditional Scotch ballads have counterparts in the popular literature of Denmark, of Germany, and of France. Thus Gérard de Nerval has printed a French ballad identical with the Scottish "Water o' Wearies Well," and a similar story occurs in the folk-songs of the Provençal *peïats*. The Scotch "Earl of Mar's Daughter" is also found among the ballads of the Champagne country. These resemblances, and others of the same sort, of course prove little, as there was constant intercourse between Scotland, Denmark, and France in the middle ages, and one country might borrow tales and songs from another. But it becomes a different question when we find the inhabitants of modern Greece in possession of a body of song of which the Scottish ballads seem only echoes and fragments. Few peoples are more remote from each other in every way than those of Greece and Scotland. The peasantry of the latter country, as Principal Shairp recently observed, owe many sterling and disagreeable qualities to the unwhispering east wind of their native hills. Stern, cautious, little addicted to music or to the dance on the village green, no rustic could be less like that Oubéitan shepherd whose elegant existence was free from all vulgar associations because there were no sheep in Oubéiti. The Greek peasant, on the other hand, is the most picturesque being that the tourist can encounter. His life, if we may trust travellers like Von Schmidt and Mr. Tozer, is a perpetual idyllic opera. There is no event which he does not celebrate by song and dance. When he leaves his home he dances at his relations if they have been disagreeable, and sings rural satires about their conduct, and when he is married his friends favour him with a genuine epithalamium. When he is dying he chants a death-song, like Grettir or Gunnar in Icelandic story, and when he is slain his widow calls for vengeance in a dirge. In fact the modern Greek seems to display survivals of that rather early stage of culture when man, as Mr. Darwin thinks, had learned to sing, but had not got quite so far as to speak. Now the point which Dr. Clark Murray would have found not uninteresting, if he had "hazarded a comparison" between Greek and Scotch folk-songs, is this—that the ballads of these two races, so widely separated at present in character and customs, are essentially identical. National song then can have but little to do with moulding national character. We go on to establish the position of the sameness of Greek and Scotch folk-songs.

When the Imperial Government, in 1852, appointed a Commission to search for the scattered remains of French popular poetry, M. Ampère issued instructions which are valuable for our purpose. He said that the genuine folk-song always presented the following features:—"The use of assonance instead of rhyme, the brusque character of recital, the textual repetition, as in Homer, of the speeches of the characters, the constant use of certain numbers, as three and seven, and the way in which gold and silver are lavished on the commonest articles of everyday use." Now all these notes are common to the Romance and the Scotch ballads. In both we hear of knives, shipmasts, horses' shoes, chairs and tables, made of gold. Talking birds are part of the machinery of both, the omniscient "popinjay" who always "up and spoke" is akin to the *épica poulletier*, the three birds who generally introduce the story in the *tragoudins* collected by Faurel, Passow, and Le Grand. And the very plots of the narrative ballads are sometimes the same. In both countries rose and briar mingle their boughs above the graves of lovers; and in both identical and non-Christian views prevail as to the state of the dead. The spectral lover in the Scotch "Proud Lady Margaret" is another form of the ghostly brother in the "Night Ride," which answers in Greece to Lenore's death ride in Germany. Thus of the four classes into which Dr. Clark Murray

divides Scotch ballads, the superstitious are akin to those of Greece, the plots of several of the romantic legends are the same, the spirit of the Border warlike ballads and of the klephtic *tragoudins* are identical. As to love songs, the Greek, as might be expected, are distinguished by Oriental imagery, and by a curious exotic languor. The Caledonian lover says

I'm young and stout, my Maribon,
Name dances like me on the green;
And gin ye forsake me, Maribon,
I'll coo gae draw up wi' Jean.

This is practical, and very unlike the Greek Iannoula, who sings how she chose a dying lover "that is not long for love and me." But, except in matters of taste like this, the character of Greek and Scotch ballads is as similar as the character of Ettrickdale shepherds and Spartan peasants is different.

The fact is that ballads, like *maharekes*, are common to all European races. They point to a primitive "solidarity of the peoples," which did not consist in international strikes, but in common traditions and innocent beliefs and festivals. There is a common basis, there are common "notes" of popular poetry in Scotland, in Brittany, as M. Luzel's collection shows, in Denmark, in Servia, and in Greece. Differences of sentiment occur; there is a Scotch homeliness in the ghosts who say

farewell to the bonny maid
That tends our mother's fire;

and there is a curious relenting in the Scotch hardness when Edom o' Gordon thinks

I might have spared that bonny face
To have been some man's delight.

Such traits have a literary interest, but on the whole the comparative study of popular songs has a different charm. They are the spontaneous voice of the unlettered people, uttered in moments of excitement, as when the dead are lamented in dirges, or stories are told in rough verse to the tune of dances in the open air. "This poetic," said Puttenham, in 1589, "is more ancient than the artificial of the Greeks and Latines, coming by instinct of nature, and used by the savage and uncivil, who were before all science and civilitie." Ballad fragments out of this stage of peasant life survive in countries where song is silent, and dance prohibited by the Kirk, and they prove that even in Scotland rural life was once idyllic. Some of the pretty dances and burdens of Scotch children are also relics of the age when "wenches and damocels," as Gawain Douglas says, "sang ring songs, dances, leades, and roundes." The Reformation and the east wind have long ago put a stop to such practices. But for all that the interest of Scotch ballads is not the influence which they exerted on the Scotch character, but the proof which they afford that the country was once "merrie Scotland." The Scotch, too, had once their dances in the free air, their gatherings to welcome May, and wanderings through the woods on Midsummer night. Life did not lack the innocent pleasures which under summer skies it still affords.

It would be scarcely possible to guess this from the more artificial and rather pedantic Scotch strains which Miss Aitken has collected for a new volume of the *Golden Treasury* series. These are the effusions of Hogg, Tannahill, Balcanquhall, Tytler, "an obscure, tippling, but extraordinary body," and other choice spirits. Miss Aitken has not been very successful in the task of selection. Some of the songs, as those by Monroë and Ayton, are couched not in the Scotch tongue, but in the English dialect. Others perhaps are only too Scottish:—

At thorny dike, and birken tree,
We'll daff, and we'll be weary O;
They'll sing ilk of frae you and me,
My ain kind dearie, O.

Such verses require to be rendered with the same spirit as Mr. James Binnie showed in his song about the "Laird o' Cockpen." The songster must "toss his glass, and bab to one man, and wink to another," to enable the Southron to take the points of his lyric. The Northern melodies which can do without such assistance have already appeared in Mr. Palgrave's *Golden Treasury*. What reason can there be for reprinting

Ah sic' a yumping,
Ah sic' a yumping,
An sic' a yumping,
About the little hare?

And we wonder what Miss Aitken means by this remarkable sentence in her introduction:—

In Part I. are such songs as are devoid, or almost devoid, of the comic element—namely, serious love-songs—for the most part lyrical, what Wordsworth would call "Songs of the Affections," an unsuitable name here, however, the Scotch being by nature a taciturn people, and mere affection seldom tempting them to sing.

Songs are generally "for the most part lyrical," and it is very cautious to adduce authority for considering love one of the affections, except in Scotland. The Scotch, though taciturn, are amorous; not like the Dutch, of whom Mrs. Aphra Behn's biographer says, "Ye may think that a Dutchman cannot love." Perhaps Miss Aitken means that more affection, without a tocher or dower, cannot make a Scotsman sing; and indeed there is a good deal of reference to tochers in the serious love songs of this frugal race. Probably it is not Miss Aitken's fault that she has not made a very attractive volume out of the choice lyrics of the North. What can be done with a nation one of whose choice lyrics is all about "yumping"? The really good Scotch songs, exclusive of Burns's best attempts, could be compressed into a very, tiny volume indeed. About most of the lyrics reprinted here it

might be said "they have been done in a corner," the poet's corner of some local journal. Perhaps Scotch patriotism would have done well to leave them there.

THE SANDWICH ISLANDS AND NORTH CALIFORNIA.*

THE shores and islands of the Pacific Ocean, though separated from each other by vast intervals, are in these days linked together by many ties of commerce and colonization, and seem likely to be either occupied by English communities or subjected to the influence of nations speaking the English tongue. The American Union exerts a predominating influence in the North Pacific; while the South Pacific, including both Australasia and the ports of our South American trade, sees a good deal more of the British flag. Our mercantile intercourse with China and Japan is indeed carried on by a different route. It does not swell the main traffic across the Pacific north of the line; but our new Pacific mail route from New South Wales and New Zealand now strikes San Francisco instead of Panama. The Chinese emigration, one of the most important agencies of industrial progress in that hemisphere, has affected California more largely than Australia; but its movement to our southern colonies may yet be increased by a judicious and liberal policy. In the meantime, the Sandwich or Hawaiian Isles, forming a halfway station between Asia and North America, have become a kind of ward or apprenticeship to the United States. This has been brought about, without any political dependence, by social and commercial influences, and in the first instance by missionary preachers and schools. The prospects of Hawaiian civilization, begun some fifty years ago by the agents of Christian philanthropy from New England, are, therefore, a topic of natural concern to Mr. Nordhoff's fellow-citizens at Brooklyn and Boston. In their minds, too, this subject is readily associated with that of his reports on California, Oregon, Washington Territory, and British Columbia, the western coast regions of their own continent. It is worth while for us to comprehend this Anglo-American outlook over the western oceanic world.

The first half of Mr. Nordhoff's book is a pleasant description of the island group, consisting of four or five larger and half a dozen smaller isles, now commonly known by the name of the largest, Hawaii, which was formerly spelt Owhyhee. Mr. Nordhoff seems to have visited the islands with a small party of friends from New York for personal recreation and instruction. They had ample leisure, of which they made an active and intelligent use. They enjoyed the mild climate, a perpetual summer tempered by the winds of the ocean. They admired the bold and varied scenery of volcanic formation, with striking contrasts of rich verdure and cliffs or beds of lava thrown up by subterranean fires. They inspected the active volcano of Kilauea, with its terrific lakes of molten lava, a furlong wide. Here the grey surface of the liquid mass is seen rippled by red circles of fire, heaving in the centre and bursting its crust, at intervals of a minute, and tossing a fiery wave to the height of thirty feet. This was its state in March 1873, but the aspects of the Hawaiian volcanic phenomena are different in other months or years. The great crater of Kilauea, within which the twin lakes above described have their place, is nine miles in circumference, and a thousand feet deep. It was till lately roofed over with a sort of immense picecrust, which suddenly fell in with a crash. The extinct crater of Haleakala is twice as deep and thrice as large. The shore of Puna for seventy miles is strewn, or rather heaped, with lava blocks, through which a horse-path is beaten for the traveller. Lava bubbles and hollow cones of cinders are found standing here and there. The volcanic mountains of Mauna Loa and Mauna Kea rise to 14,000 feet, but with a gradual swelling ascent, and there are no sharply outlined summits. Snow lies upon the highest ridges. In each of the principal islands a surprising difference of climate as regards moisture between the windward and leeward sides is caused by the Pali, lofty and compact mountain ranges which exclude the trade-wind vapours from the western shores.

The extent of land available for either agricultural or pastoral uses is very limited. Deep gorges and narrow valleys, shut in by the mountains, with but a few acres of level bottom, contain the little plots of ground which are planted with taro, a wholesome esculent root. The taro field needs culture under water, like a rice-field. This root is baked and beaten into a mash called poi, which is the common food of the people, but rice is also eaten. Sugar plantations have employed some foreign skill and capital; but the want of a convenient market has deprived the owners of adequate profit. Both cotton and coffee have usually suffered from blight and caterpillar; the cacao is not more fortunate. Corn does not thrive, and it is not worth while to grow fruit. Some grazing may be found in certain districts for cattle and sheep. But, on the whole, in Mr. Nordhoff's judgment, there are few opportunities in this region for making a fortune by industrial investments. Sugar and rice may be cultivated to some extent by means of Chinese coolie labour, and that is all. He deprecates the political annexation of these islands to the United States, as neither desired by the native people nor required by American interests. The purchase of the commodious Pearl River harbour, ten miles from Honolulu in the island of Oahu, would provide the Union with a commanding naval station,

if such an acquisition were needful in the present state of international politics. But Mr. Nordhoff thinks it is not required, inasmuch as his country is not "a second-rate Power likely to be bullied by other nations." He prefers to look upon the Happy Isles of the Mid Pacific as an agreeable retreat for Americans of refined taste, with an idyllic longing for the grace and peace of a social condition altogether unlike that of their own bustling cities. It is delightful, he says, to a jaded New Yorker, instead of frantically rushing after latest items of news at all hours of the day and night, to stand upon the wharf at Honolulu and watch the departing steamer, with the serene consciousness that there will not be another mail for a whole month. As there is no submarine telegraph, the most anxious or ambitious speculator on contemporary affairs must be content to let the world get on without his superintendence, all except the 56,897 souls inhabiting this "toy kingdom." Some of us have experienced this sense of relief during two or three days' respite from the postman and the *Times* in the Hebrides or the Channel Islands, and can sympathize with the American oppressed by his responsibility for the welfare of a continental commonwealth.

The praise which Mr. Nordhoff gives to the little band of Puritan evangelists and American civil administrators by whose labours the dwindling remnant of the Hawaiian people has been trained into habits of order and comfort, is doubtless well deserved. At the same time we must confess to a certain amazement, which has occurred to us in other similar instances, when along with pleasing reports of moral and physical welfare resulting from an imported superior civilization we peruse the statistics of a quickly perishing race. These Kanakas, as the natives of the Hawaiian Islands call themselves, are a good-humoured, intelligent, and docile people. Their soft Polynesian temper has not been stiffened by their New England teaching, but they have been drilled into a fair observance of personal and social decencies, like the majority of professed Christian nations. Their manners are frank and gentle. Theft and homicide are not more frequent with them than with other folk. Mr. Nordhoff says they are not lazy, which is much to say for the inhabitants of a land which knows no winter and which yields plenty of cheap food. But the Kanakas need only work two days in the week, and may then lie on the grass. They all go to school in youth and learn to read and write; they all go to church or meeting, just like the people of Massachusetts. Every man reads his newspaper, as well as his Bible; the native gentlemen are magistrates or members of Parliament, and there are even native ladies. It was therefore in a spirit of reflex irony, as those who heard Mark Twain in London will remember, that his lecture was entitled "Our Fellow Savages in the Sandwich Islands." All this appears very satisfactory till we fall upon census returns, with two startling arithmetical figures; namely, first, 130,315, the actual number of the Hawaiian native population in 1832; secondly, 51,531, its number in 1872, after forty years of benevolent and apparently efficient social reform. It is the same with the kindred Maori nation of New Zealand, which has been diminished by more than half within thirty years. These races have neither been slaughtered nor starved under the protection of a civilized government. Their tribal wars and massacres have been stopped. They have, in some cases, been fed and clothed, or furnished with seed and land to enable them to grow food. They have been cared for, upon the whole, with as much zeal and assiduous public charity as the poorer classes of our countrymen in Europe. But when prevented or dissuaded from killing each other, they simply die out of their land, having begotten and reared no children to fill their place. In the meantime, however, the Kanaka has at any rate an easy life of it, with as few cares and toils as any man upon earth. He can afford to sleep at noon, or to amuse himself by galloping half-broken horses or swimming upon surfboards. He wears a loose ungirt frock, and fills his stomach at pleasure. His rulers affect no vexatious bigotry; feasting, dancing, singing, and card-playing are not proscribed under the mild reign of King Kalakaua. Many youths in the upper class of natives get an English education. They are as proud and fond of the little insular realm as Manxmen of their Tynwald and House of Keys. The unassuming monarchy, which is practically almost elective for lack of heirs, is supported by rich princes and nobles, whose old feudal privileges are surrendered, but who are still revered by the common people.

The second portion of this volume is a descriptive and statistical account of the Sacramento Valley and the Mendocino coast district, north of San Francisco, the Columbia River and Puget Sound, to the northern frontier of the United States territory, with a glance at Vancouver Island. The author has carefully examined those parts of California, Oregon, and Washington, with a view to giving advice to New England agricultural settlers who might be inclined to go there. It is a region with many advantages of situation, soil, and climate, to which Mr. Stamer's "Gentleman Emigrant," recently noticed by us, might well direct attention. Land lots are for sale on easy terms along the Sacramento Valley railroad. The citizens of California, indeed, show as keen and strong a spirit of enterprise as prevails in any State of the Union. Sheep and cattle grazing, as in Australia, wheat and barley growing, the cultivation of raisin-grapes, almonds, peaches, cherries, and a variety of fruits; the dairy-farming in Marin County; the growth of tobacco, the production of silk, the cutting of redwood and other timber in the Oregon forests, with the salmon and coast fisheries, are recognized sources of wealth. They are not likely to be neglected by the active Californians, if the senseless outcry against Chinese labour, raised by the "Hoodlums," or town rowdy mob of San Francisco,

* *Northern California and the Sandwich Islands.* By Charles Nordhoff, Author of "California, for Health, Pleasure, and Residence." London: Sampson Low, Marston, Low, & Searle. 1874.

be not allowed to deprive the country of useful hands. The number of Chinese working in California is nearly fifty thousand; they are not very nice people, but they are most trustworthy and diligent servants in every drudging task. Their immigration, the ocean passage from China and their reception at San Francisco, the contracts for their first employment, the care of those who fall sick, the relief of those in distress, the funeral rites for those who die, and the means of returning to China with any money they have saved, are managed by Chinese voluntary societies. These companies have corresponding associations in China, but somewhat resemble the trade-unions of our European artists. In the Sandwich Islands there are two thousand five hundred Chinese. The number of Chinese at present in all our Australian provinces together is under thirty thousand, many of whom are gold-diggers on their own account. A New England farmer, bringing his family to live in a Californian home, might reasonably be unwilling to keep Chinamen in constant association with the inmates of his own household. But much work is to be done in which they can be employed without risk of contaminating or offending others. Such are the very useful operations in the Sacramento and San Joaquin alluvial plains; the reclaiming of the "tule" lands, to the extent of several hundred thousand acres, by constructing dykes against the overflowing river. "Tule" is a species of tall reed, which, decaying yearly, with some rank grasses of the marsh, has mingled with the deep mud, and this compost of rotten vegetable matter has made a wonderfully fertile soil. When enclosed and drained, its surface is burned; corn is at once sown thinly in the soil or ashes; a flock of sheep is driven over it to tread the seed in; and the first wheat crop from land thus prepared will often be forty or even sixty bushels an acre. For the second year's crop the land is ploughed; but the horses must be shod with broad slabs of plank, that they may not sink into the spongy depths of the quaking field under tillage. It is not stated that a residence upon such land is unhealthy, while the profits of owning and farming it may be enough to compensate even for the risk of malaria fever. Mr. Nordhoff describes other notable examples of agricultural improvement on a grand scale, with the best mechanical aids, in which California may teach a lesson to older and more populous States. There is an estate of 18,000 acres belonging to a Mr. C. W. Howard, divided into nine dairy farms for the sole purpose of making butter from the milk of 1,500 cows, which is a characteristic instance of thorough devotion to one practical object. Several other great landowners are mentioned as possessing 20,000 or 30,000 acres of the richest land in the most convenient situations, with long rent-rolls of tenant-farmers. This state of proprietorship in some districts of California may perhaps be expected to influence hereafter the social and political life of the community.

Oregon and Washington Territory, with much picturesque scenery of wood and water, deserve the tourist's attention, though comparatively backward in fitness for industrial occupation. An Englishman with two or three summer months' leisure, carrying his rod and gun or his sketch-book, might find it worth while to cross the Atlantic and the American Continent for a ramble thereabouts. He would visit, in a few weeks, the Farallon Isles of the coast, with their sea-lions and diverse species of sea-fowl; the sublime volcanic peaks and strange lava-beds of the interior, Mount Shasta, the Klamath district, and Mount Hood; the cascades and dalles of the Columbia River, and the winding inlets of Puget Sound. From these places he would pass to the shores of Vancouver Island and British Columbia, a remote and sequestered part of the Canadian Dominion. It is but five thousand miles' journey from Great Britain; and Mr. Nordhoff's account of the Far West may invite some reader to start at once in that direction, with good prospects of enjoyment.

ORKNEYINGA SAGA.*

MR. ANDERSON has carefully edited a Saga which is certainly not without value for the early history of Scotland. The period which it covers is practically not much more than two centuries, the last event mentioned in it being the burning of Adam, Bishop of Caithness, which took place in 1222. The closing sentences speak of the vengeance taken for this deed as still quite fresh in the memory of men, and may therefore be taken as proving that the Saga was completed before 1225, a conclusion confirmed by the fact that quotations from it under the title of "Jarla Sagan" are made by the compiler of the *Fagrskinna*, which is known to have been completed in, or shortly before, that year. Under the same title its earlier chapters are embodied in the *Olaf Saga* of Snorri Sturluson, who died in 1241. It follows that from the *Orkneyinga Saga* not much is to be gathered of the history which is given in ample, if not wearying, detail in Mr. Anderson's elaborate introduction. The treaty by which Magnus IV. ceded to the Scottish King Alexander III. all the rights of the Kings of Norway over the Isle of Man and the Sudreys was not executed until more than forty years had passed from the last event noticed in the Saga, when the last of the Norse Earls of the Orkneys had still ten or eleven years of life before him. Hence Mr. Anderson has undertaken a task not

necessarily involved in the work of an editor of the *Orkneyinga Saga*, by adding the history of the earldom through the subsequent lines of Angus, Strathern, and St. Clair, and the history of the bishoprics of Orkney and Caithness to the year 1469.

These introductory chapters will give to those who are curious in such matters an ample store of genealogies recording the complicated alliances of families whose power presents no very distinct image to the modern mind, and giving the somewhat barren records which alone tell us of the lives of men redoubtable enough in their own day, yet not specially remarkable among their fellows. Nor can very much more on the whole be said of the actors in the Saga itself. In its earlier portion at least it is probably not a contemporary document; but although much of it may have been put together from the songs of bards, and although we may have to make allowance for the exaggeration or the evasions of poets when singing the praises of feudal chiefs whose power must be upheld at all costs, there is nothing in the extent of time over which these oral traditions extend to call for any large measure of doubt as to the general correctness of the story. That oral tradition may, amongst a people of fair intelligence and moderate truthfulness, be trusted generally for about one hundred and fifty years was admitted by Sir Cornwall Lewis himself; and in determining the measure of trust to be recorded in each particular case we have no specially difficult task when, as with the *Orkneyinga Saga*, we have other documents, some of them strictly contemporary, by which they may be checked.

The first impression left on the reader's mind by this Saga, as by others of the class to which it belongs, will probably be that of an astonishing fulness of personal details, not attainable even amongst modern writers except by novelists, who may be supposed to see round corners or hear men talking within stone walls. But it soon becomes apparent that these personal details are mostly due to the habit of presenting in the form of dialogue or conversation between the actors events which probably came to the bard, or the chronicler in a sufficiently dry and accurate form. An Orkney earl submits himself to Harold Hardrada, Sigurd's son, whose resentment, as he well knew, he had seriously provoked. The King accepted his submission, and continued on friendly terms with him until his anger was roused by the discovery of some fresh wrong which led the earl to express regret that he had been too merciful to an enemy whom he had had in his power. This, thrown into a dramatic form, gives us two conversations, the accurate reporting of which is by no means likely, and about which we become more suspicious when we find that these personal details are as abundant at the beginning of the Saga as at the end of it, and that they are least plentiful just in those parts which from comparison with other records we have reason to regard as most nearly historical. The vivid picture which exhibits Earl Thorfinn in conference with Harold Hardrada gives place to dry recitals when the Saga touches on the victory of that king at Holderness and his death at Stamfordbridge:—

He went from Orkney to England and landed at a place called Kildland, and took Skaraborg (Scarborough). Then he touched at Hallarnes and had a battle there in which he was victorious. The Wednesday next before Mathiasmas (20th September) he had a battle at Yorbik (York), with the Earls Valthief and Morukari. Morukari was slain there.

The rest of the story to the dismissal of Olaf, the son of the Norwegian king, by the English Harold, is told in the same unadorned fashion. But the meagreness of the narrative is no surety against misstatements. If we have slender grounds for believing that Walthief was concerned in the struggle with the Northmen, we know that Morukari was not slain in the battle. The mistake is pointed out in a note which, however, tells us that "Morukari was present at the battle of Hastings, and he and Walthief went afterwards to Normandy with William the Conqueror," as though this were all that is known of the subsequent history of these two men. Elsewhere, when the Saga is giving the dates determining the time of the beheading of the sainted Earl Magnus, the editor is obliged to note that these dates are "self-contradictory and utterly irreconcilable," the amount of the error extending to about a quarter of a century.

On the other hand, although we have to deal warily even with the least adorned statements of this Saga, we have none of those manifest absurdities and impossibilities which run through some Sagas reputed to be historical, and notably the Icelandic chronicle or myth of *Grettir*. The *Orkneyinga Saga* has no heroes who do the deeds of Herakles or Samson; and although it has its tales of cowardly murder, it nowhere speaks of fifty or a hundred men lurking in ambush to surprise and slay a solitary man. Hence the Saga may be taken as exhibiting with tolerable faithfulness the manners and fashions of the times, however vague and indistinct may be the personal portraits which the Saga-man delights in giving. These may be passed by as the drawings of a very free hand. If Earl Thorfinn "was a man of very large stature, uncouth, sharp-featured, dark-haired, and sallow, and swarthy in his complexion," if he had "a gold-plated helmet on his head, a sword at his belt, and a spear in his hand, and he cut and thrust with both hands," if he was "avaricious, harsh, and cruel, yet a very clever man," and if of the two brothers Einar and Brudi the former was "clever and fond of company, eloquent and beloved," while the latter was "stubborn and taciturn, disagreeable and avaricious, yet a great warrior"—all these, or most of them, are features too common in a coarse and brutal age to

* The *Orkneyinga Saga*. Translated from the Icelandic by Jon A. Hjalatalin and Gilbert Goudie. Edited, with Notes and Introduction, by Joseph Anderson, Keeper of the National Museum of the Antiquaries of Scotland. Edinburgh: Edmonston & Douglas.

* See *Saturday Review*, January 29, 1870.

distinguish one man specially from another. But on their ways of life and modes of thought the evidence of such Sagas is invaluable.

Among the most characteristic of these pictures of life and customs is the chapter which tells of the dealings of the Orkneyan Earl Hakon in Norway with a spæmann or sorcerer. Hakon's Christianity sat very loose upon him, and his declaration of thorough neutrality draws from the spæmann an expression of gladness for the scant regard which he pays to the faith of his kinsmen:—

"Truly [says the magician, speaking of Christian ascetics] they who apply themselves to such things are strange men. They keep fasts and vigils, and believe that by such means they will be able to ascertain that which they desire to know, but the more they apply themselves to these things, the less they ascertain of what they wish to know when it is most important to them to know it. But we undergo no bodily pains, yet we always obtain knowledge of those things which it is of importance to our friends not to be ignorant of. Now matters will go between us in this way, that I shall help you because I understand that you think you will rather obtain the truth from me than from the pændlers of King Lugi, in whom he puts his entire trust."

The prophecy which follows this high-sounding preface is not much less meagre and ambiguous than the oracular an-ways which are said to have deluded Cæsar or Maximian, and perhaps not much more ingenious than the predictions of gipsies in our own day:—

"If you wish your whole fate unfolded, it is a long tale to tell, for there is a great future in store for you, and grand events will happen at certain periods of your life. I foresee that you will at last become the sole ruler of the Orkneys, but you will perhaps think you have long to wait. I also see that your sons will rule there. Your next journey to the Orkneys will be a very eventful one, when its consequences appear. In your days you will also commit a crime, for which you may or may not obtain pardon from the God in whom you believe. Your steps go further out into the world than I am able to trace, yet I think you will regret your bones in the northern parts. Now I have told you what has been given me to tell you at this time, but what satisfaction you may have derived from your visit rests with yourself."

The interview closes with the expression of a hope on Hakon's part that his fate may prove better than the prophecy, and of a suspicion that the spæmann may not have seen the truth, and with the retort of the sorcerer that, though Hakon was free to believe or not as he pleased, all things would come to pass as he had said.

The crime referred to by the spæmann was, seemingly, the murder of St. Magnus. Similar deeds may be said to form the staple of the Saga, but if the murders are cruel, they are cruelly avenged. The record closes with a notice of the mutilations, deaths, confiscations, and outlawries inflicted by Alexander's "Sons" and for the burning of bishop Adam of Caithness, in 1220. His predecessor Jon had fared not much better. His mission to meet the Orkneyan Earl Harold in the hope of saving his people from his vengeance, he was seized by the orders of his chief, his tongue was cut out, after which, the Saga adds, a knife was thrust into his eyes and his sight destroyed. Even here, among the latest entries in the Chronicle, the facts are not so sure as they might be. Fordun says that they left him the use of his tongue, and, in part, of one of his eyes; and the Saga-man calls his own statement into question when he adds that the Bishop almost immediately afterwards recovered both his speech and his sight at the grave of the holy Tröllhanna. Perhaps the truest account is preserved in the letter of Innocent III. to the Bishop of Orkney, prescribing the penance to be performed by the criminal, and asserting that Lombard, a layman, the bearer of the tidings to Rome, had accompanied his master on an expedition into Caithness; that there the Earl's army stormed a castle, killing almost all who were within it (an incident not noticed in the Saga), and that "this Lombard, as he says, was compelled by some of the Earl's soldiery to cut out the Bishop's tongue." The Pope seemingly knew nothing of the blinding, for the penance has no reference to the criminal's eyes, although it enjoins as a portion of the burden to be laid upon him

that he shall hasten home, and barefooted and naked, except breeches and a short woollen vest without sleeves, having his tongue tied by a string and drawn out so as to project beyond his lips, and the ends of the string bound round his neck, with rods in his hand, in sight of all men, walk for fifteen days successively through his own native district, the district of the mutilated Bishop, and the neighbouring country.

The conclusion being that he shall spend three years as a crusader in the Holy Land.

The most interesting part of the introduction is perhaps that which relates to the Cathedral of St. Magnus at Kirkwall, a church majestic in itself, even as compared with the great churches of England, and in nothing more remarkable than for the strange contrast exhibited by the ecclesiastical buildings of the surrounding islands. Some of these churches, nave and chancel together, are less than forty feet in length by twenty in breadth, while their chancel entrances are about two feet in width by four in height, an arrangement which might be acceptable to many persons nowadays as an effectual check to excessive Ritualism. To this account of the Christian churches the editor adds a description of Macsow and the Stones of Stennis, illustrating the horrible rites which accompanied the burials in these mound-sepulchres by a long quotation from the Arabian Ibn-Fozkand, an Ambassador from the Caliph Al-Moktadir in the early part of the tenth century. The Northerners of that age retained their partiality for burning their dead. A bystander at one of these ceremonies said frankly to the Ambassador, "You Arabs are fools. You take the man whom you have most loved and honoured, and put him down into the earth where vermin and worms devour him. We, on the contrary, burn him up in a twinkling, and he goes straight to Paradise." On

this occasion only one woman, it seems, was sacrificed to accompany her master into the unseen world. The offering of one victim was probably a survival of the earlier practice which would have slaughtered all his wives together.

VICTOR AND VANQUISHED.*

THIS book belongs to a class whose days, it is to be hoped, are numbered. Its heroine is a young woman who arrives in the character of companion at High Athelston, the country house of Lady Athelston, the great lady of a county which the author chooses to call Highshire, where she and her son, Sir Neil Athelston, "the idol of many a London drawing-room, and withal the handsomest young baronet in half-a-dozen counties," as we are told, are living. When she begins by entering the house "with just such a quiet grace as one could fancy in its young mistress," one begins to suspect, both from the fact and the apostrophe which the writer employs with such skill to emphasize it, that there is some mystery connected with her and with it. And it is gratifying to find this suspicion confirmed by a "certain shrinking in her eyes and steps" as she walks about the passages, as well as by the unpleasant coldness with which she receives the attempts of Sir Neil to make himself pleasant, as he leans against the chimney-piece in "his faultless evening dress." This epithet seems, in the minds of many authoresses, from Miss Braddon down to writers in the *London Journal*, to be as inseparably connected with men's evening dress as is "long-shadowed" with spears or "noisy" with the sea in Homer. It is less easy, however, to assign a cause to the English epithet than to the Greek one; and if there were any chance of such novels as *Victor and Vanquished* being preserved as long as the *Iliad*, the constant recurrence of the expression in their pages might give rise to much theorizing by future commentators. It is probable, however, that they will be spared this trouble. On the day after Miss Chester's arrival at High Athelston, Sir Neil, who is described as being selfish, indolent, and spoilt, but with all his faults a gentleman, lies in wait for her in the grounds with a view to renewing the attentions which she has before received with so little kindness. Their conversation is brought to an abrupt close by his advising her not to take up archery as a pursuit, but to leave it to stronger hands than hers, and pointing his advice by putting out his right hand and touching her "slight white fingers" with a rapid though gentle gesture. On her resenting this extraordinary piece of impertinence from a young man whom she has only seen once before, and that only for a few minutes, and to whose mother she is engaged as companion, by going straight away from him into the house, he mutters to himself that "it is not natural, and she seems to have some mad reason for her incomprehensible behaviour."

There is indeed something incomprehensible in this incident, but the student of *Victor and Vanquished* will soon cease to be surprised at anything which happens among the singular people whom he will encounter in its pages. Close upon Miss Chester's repulse of Sir Neil follows an interview between him and one Eustace Jeffrey, a tutor in the neighbourhood, who is easily recognized as the clever schemer and villain of the book, amongst other things by the extraordinary glamour which seems cast by some kind protecting power over all his actions and words, as it is over those of so many villains in novels. Thus, while to the reader he appears to go about his schemes with a marvellous want of ingenuity, with a stolid openness and persistence which must inevitably lead to their discovery, the personages with whom he has to deal see nothing and suspect nothing; Mephistopheles or Iago could not accomplish their ends with greater smoothness and success. Sir Neil, who at other times displays no natural absence of perception, is no more impressed by the fact of Jeffrey immediately turning the conversation with considerable awkwardness to the subject of Miss Chester, and counselling him to make prompt love to her, than by his saying, not a minute after he has denied all knowledge of her, that if Sir Neil wants any assistance to his suit, he can supply it. As a relief from the presence of this smiling villain we are introduced to Miss Marjorie Castillain, who has been for a long time engaged to Sir Neil, and comes, out of the kindness and frankness of her heart, to call upon Lady Athelston's companion. So frank, cheerful, and open-hearted is this young lady, so little fettered by any of the iron laws of convention, that in the course of her first conversation with Miss Chester, of whom she knows absolutely nothing, she describes her father, "in a fresh young happy voice," as an inveterate mean successful miser, and her sister as a beast. It must be admitted that Miss Chester keeps up with some success the self-contained and strong character which has been assigned to her by her conduct when this decidedly startling revelation is made to her. She exhibits no surprise, and makes probably the best reply she could make under the circumstances, "I hope not." Here is a specimen of the pleasant confiding way in which Miss Marjorie talks to a stranger whom she sees for the first time:—

"Louisa would tell the world in a bewailing tone, and be supremely happy. Miss Chester, haven't I cause to love, honour, &c., my father, who never utters a loving word to me from morning to night, and only remembers my existence just as an agent in this marriage; while he knows the Athelstons are a selfish, dissipated, unprincipled race? I do not think there ever will be a good and upright master here until the old name dies out; and there does not seem much prospect of that, does there, when you look at the stalwart figure of the present baronet?"

* *Victor and Vanquished*. By Mary Cecil Hay, Author of "Hidden Perils," &c. 3 vols. London: Hurst and Blackett. 1874.

No doubt some license, or at least some departure from ordinary rules, may be allowed to the conversation of a genius, and one cannot doubt that Miss Marjorie had a touch of genius when one reads afterwards of how she solves a difficulty on being asked by the man to whom she is engaged to play something lively—"Tom and Jerry," for instance—and by the man whom she loves to play something grave. She plays the "quick, gay old tune," but infuses into it so much pathetic and mournful harmony that tears rise into the eyes of those who listen. This is as curious a feat as that performed in Victor Hugo's *Travailleurs de la Mer* by Gilliat, who serenades his ladylove on the bagpipe with "l'air mélancolique de Bonnie Dundee."

While Miss Marjorie indulges in such eccentricities as these a dark plot is thickening around High Athelston. A few days after her arrival there Miss Chester goes out alone after nightfall to a lane wherein stand two cottages, one tenanted by a cross and scolding old woman, the other by a poor struggling artist with whom she wages a deadly feud, and a little boy. In the latter Miss Chester has so strong an interest that she remains for a considerable time perched on the window-sill in the darkness and the cold, gazing eagerly through a chink in the shutters into the room inside. It is difficult to guess why she remained there instead of going into the room, whose occupant she knew to be her twin-brother, devotedly attached to her, except for the purpose of mystifying the reader and prolonging the story. It should be said that in the scenes between this artist, who, finding perhaps the singularity reigning all around him infectious, has adopted the very singular name of Fitz Spendir, and Jet the boy whom he has adopted, there are indications that the writer could, if she chose, do far better work than is for the most part put before us in *Victor and Vanquished*. They contain some real perception of character, and power of giving it expression and life, enough to make one wish that the author had cultivated her talent in that direction instead of following in the paths of mystery and sensation. Fitz Spendir, it seems, is living in the utmost quiet and seclusion in this cottage, executing commissions for a Colonel Stuart, who has made a protégé of him; but his quiet is doomed to be disturbed. Jeffrey, with his insidious villany, manages to secure an interview with Doreas Cheere, the artist's next-door neighbour, in her cottage, and in the course of it to discover that the partition wall between the two houses is so thin that one standing against the wall in one of them can hear every word spoken in the other. He soon makes it evident that his secret object is to get the chance of standing frequently in that position, and that he must devise some means for securing that chance. Of course so deep a schemer finds a plausible excuse at once. He is turning over the books and papers on Mrs. Cheere's table when he comes upon an Illustrated History of England by which she sets great store. Here is the very thing desired close under his hand. May he come in every now and then and look at this valuable and interesting work? Having obtained permission to do this he laughs as he walks away bugging himself at the thought of his dexterity in preparing for the work lying before him, "the crafty, cruel work which his hand and heart were skilled to do and design." This crafty cruel work he proceeds to execute further by persuading Lady Athelston to write again to the lady from whom Miss Chester brought her character and references. This Lady Athelston does, but without any effect, as Miss Chester frustrates her intentions by going to the post-office and stealing the letter from the counter where it lies. That a young woman who has installed herself in a situation by means of a false character should not stick at this is perhaps not surprising; but it is a little strange that Miss Marjorie, who in spite of being, according to her own artless account, daughter to a miser and sister to a beast, is supposed to be a charming and excellent young woman, should do precisely the same thing, when by an unlucky mischance the letter falls back into Jeffrey's hands and is posted again. While all this has been going on we have been learning by degrees that Fitz Spendir, Miss Chester's twin-brother, is in fact the rightful heir of High Athelston, by virtue of course of that most convenient occurrence, a secret marriage; and that he has been ruined early in life by Jeffrey, whose plots to get him transported for a forgery which he never committed, although worked out with his usual dexterity, were crowned with signal success.

It would be idle and tedious to follow out the confused intricacies of the plot. It is enough to say that Jeffrey, having overheard, and caused Mrs. Cheere to overhear, Fitz Spendir saying in a moment of passion, "I should think it no sin to kill Eustace Jeffrey," sets to work to persuade the artist to throw him into a deep tarn, and succeeds. It is needless to say that he is not drowned, although how he managed to escape all observation as he got to shore, the tarn being watched by numerous observers, is never explained. He disappears and departs to Africa, leaving Fitz Spendir accused of murder—a very proper aim no doubt for so accomplished a villain; yet one cannot help reflecting that in order to compass it he had to give up all the pet schemes of a rich marriage in Highshire which he had long indulged, and was then just on the point of successfully concluding. Surely there has seldom been set down a better instance of a man cutting off his nose to spite his face. At the supposed murder there is a great deal of surprise, horror, and indignation, yet so little trouble is taken to secure the assassin that he is able to walk quietly to the railway station and take his place in a train with a view to escaping, which he no doubt would have done had not his intentions been suddenly

changed by his catching sight of a Biblical inscription hung up in the waiting-room. During the time which he occupies in this performance his sister, who saw him throw Jeffrey into the tarn, has fled from the terror of being called on to give evidence against him, and wandering long among the hills finds refuge at last with an old woman who tends and nurses her, and finds in her a brightness and comfort for her lonely cottage. Miss Chester's first action on recovering her strength is to go away while the old woman's back is turned, and make her way to London, where she is found fainting on a doorstep by Sir Neil Athelston, and brought back to the scene of her brother's misfortunes. Then follows his trial at the assizes, a trial which is conducted in quite as remarkable a fashion as one would expect from the rest of the book, the scale being finally turned in the prisoner's favour by the weight of a mass of absolutely irrelevant evidence contributed (by kind permission of the Bench) by Doreas Cheere, the cross old woman living next to Fitz Spendir, of whose long-lost child it appears that the boy adopted by the artist is the son. Fitz Spendir makes immediate use of his liberty to wander through the country in search of the register of his mother's marriage, which, although he has no real clue to the church where it was deposited, he succeeds in finding. Having found it, however, he is seized with fever, and dies leaving his sister to marry Sir Neil, and so occupy her ancestral home. Absurd and impossible as *Victor and Vanquished* is, it has a certain spirit which makes it more readable than many of its class, in saying which we are, however, giving it no great praise; but it also contains hints of a capacity in the author for better things, and it is to be hoped that she may cultivate that capacity.

FRENCH LITERATURE.

WE have received a number of valuable works from a single publishing house in Paris, each of which would deserve detailed comment; but we must be content to notice them briefly in succession. The first of which we shall speak is M. Duseigneur Kléber's interesting monograph on the silkworm*, comprising a description of the various species, a history of the transformation undergone by the cocoons, the breeding of the insects, the preparation of the silk, &c. A work like this would, as the author remarks, have been impossible twenty years ago, for the simple reason that the breeds cultivated in France, Italy, and Spain offered the closest physical resemblances to each other, and none of the countries interested in the production and manufacture of silk thought it worth while to ascertain what fresh resources could be derived from foreign districts, where the insects were supposed to be of an inferior quality. The disease which has visited the silkworm, by destroying the old varieties, has had the happy result of obliging the growers to seek for new types, and thus it is that what was at the time a real calamity may be said to have extended and perfected all the branches of industry connected with silk. M. Duseigneur Kléber, who is evidently thoroughly conversant with these questions, has produced a treatise which exhausts the whole subject of sericulture, and which is illustrated with characteristic engravings and an excellent map.

Many valuable works have been produced from time to time on the subject of roses, but they are now generally considered as incomplete, on account of the introduction within the last few years of numberless varieties previously unknown. Even Redouté's splendid volume is now seldom consulted, and amateurs preserve it in their libraries chiefly as a monument of what was the condition of a speciality in horticulture towards the beginning of the nineteenth century. M. Rothschild has therefore deserved well of the public by bringing out a new treatise on roses†. The preface, from the pen of M. Naudin, member of the French Institute, gives a few general remarks; Messrs. Jamin and Forney then discuss in detail the formation of a rose garden, the principal varieties of the plant, and the best way of bringing them to perfection; and they conclude with a brief description of sixty species, giving in each case a large-size chromo-lithograph from the pencil of M. Gröben, an artist well known by his experience as a botanical draughtsman. Sixty woodcuts also are interspersed throughout the volume.

The labours of M. de Saulcy in connexion with Jewish archaeology have long since been appreciated in England; we have often recognized their undoubted merit, and it is with great pleasure that we speak once more of the researches of the distinguished French antiquary. The volume now before us forms the sequel of one devoted to Jewish coins, which, as soon as it appeared, suggested publications of the same kind both in Germany and in this country. On the present occasion M. de Saulcy aims at describing the autonomous coinage of Palestine‡, reserving for another instalment the period of the kings. His object being to study exclusively the regions over which the Jewish rule prevailed more or less firmly, he has left entirely unnoticed Phœnicia properly so called—that is to say, the tract of country extending northwards from the Scala Tyriorum, or as it is now designated, the Bar-el-Abidh. The Synecdoche of the grammarian Hierocles, completed by Reland's *Palestina illustrata*, will enable the student to identify all the places whose coinage is described in M. de

* *Le cocoon de soie*. Par M. Duseigneur Kléber. Paris: Rothschild.

† *Les roses: histoire, culture, description*. Par H. Jamin et E. Forney. Paris: Rothschild.

Sauley's new volume; but, in addition to this source of information, he has given in his preface a classified list of the various cities mentioned, adding likewise a chronological table of the reigns to which the specimens described respectively belong. Most of the coins enumerated have been examined by the author; the remaining pieces are named from the most trustworthy sources—such as Mionnet's lists, &c. Each section of the work is preceded by a short geographical notice, which will be found extremely valuable, and the twenty-five plates which terminate the volume reproduce all the most noteworthy specimens. We should add that the numismatic collections of England and France have alone contributed to M. de Sauley's catalogue; nothing is borrowed from German museums.

We had very recently occasion to thank M. Champfleury* for an amusing volume on historical caricatures; the agreeable octavo which he now devotes to children will help to establish his reputation not only as an excellent humourist, but also as a shrewd observer of human nature. The war with Germany, with its accompanying disasters, modified to some extent M. Champfleury's original plan, and led him to give a more serious character to what was originally meant for a mere outburst of fancy and imagination. The third and concluding part of the volume, treating as it does of pedagogy, contains remarks which every one should study who has to do with the training of children, and the illustrations added so plentifully in the various shapes of woodcuts, etchings, and chromo-lithographs, are admirable. They comprise copies from the works of Rubens, Breughel, Germain Tilon, Chardin, and others, besides the productions of contemporary artists. Many of our readers may remember M. Champfleury's witty monograph on the genus *cat*; in treating of children he has been equally successful.

Any notice of Dr. Civiale's volume on lithotripsy† would be beyond the province of this journal, and we merely mention the work for the information of professional readers. Count de Lagondie's two little volumes‡ are likewise too special in their character to be discussed in this place; but we can recommend them to the consideration of all persons interested in horses, adding that the author readily acknowledges the obligation he lies under to the pseudonymous writer whose *nom de plume* of Stoneheuge has become so popular on this side of the Channel. The pictorial illustrations, genealogical tables of celebrated racehorses, indices, &c. &c., add to the value of the book.

Drawing, says M. d'Henriet§, has too long been considered merely as an *art d'agrément*, a pleasant pastime, an elegant recreation; but in his view it should be regarded in the light of a language—the universal language of form; thus viewed, it is an essential part of all programmes of education, and should be seriously studied. Both teachers and pupils seem to think it their business to seek especially for effect in their attempts to reproduce either natural objects or works of art, and consequently the system of instruction adopted by most schools is one where routine prevails to a deplorable extent. In publishing a manual of drawing for elementary schools M. d'Henriet has endeavoured to introduce the reforms which experience has taught him to be necessary; his course of instruction comprises geometrical drawing, perspective, and anatomy; it is exemplified by numerous engravings inserted in the letterpress, in addition to a folio atlas of forty-four lithographs.

M. Cousin's well-known studies of French society in the seventeenth century have set an example which still continues to be zealously followed. After M. Pierre Clément's sketch of Mme. de Montespan and his more elaborate volumes on Colbert, to which we may add M. Momnier's work on Chancellor d'Aguesseau, we have now a monograph of Séguier, by M. René Kerviler||, an author whom we hasten to welcome amongst the most learned and industrious investigators of the *grand siècle*. For thirty-seven years Keeper of the Seals, distinguished equally as a statesman and as a patron of literature, Pierre Séguier deserved a place in the gallery of French celebrities; and, thanks to M. Kerviler, he has now obtained it. The sources of information respecting his political and private life are abundant; in addition to forty-six volumes of correspondence hitherto unpublished, the memoirs of the times are full of details which required merely to be put into a proper shape, and M. Kerviler has done this with considerable success. His volume comprises, first, a biography of Pierre Séguier; next, a brief account of the various Academicians who frequented the Chancellor's hôtel; and, thirdly, a very copious appendix of *pièces justificatives*. The details respecting Fouquet's trial occupy, as may well be supposed, a conspicuous place in this book; we know from Mme. de Sévigné's letters that Séguier conducted the whole affair with the firm intention of upholding the dignity of the Crown and of punishing the scandalous malversations which had rendered the Surintendant's name so thoroughly hated in France. M. Kerviler shows that the judgment passed upon Séguier's behaviour by Lefevre d'Ormesson and the *scintillante margotte* was extremely unfair, and he has no difficulty in vindicating the Chancellor's character against the calumnies of the Jansenist cabal.

The literary history of the Théâtre Français is well known, or at least it ought to be familiar to all students of dramatic art, for it has been discussed in several excellent works, such as those

of the brothers Parfait, M. Alphonse Royer, and Maupoint. The administrative history is a totally different subject, and no one had attempted it before M. Bonnassies.* Like all other public establishments in France, the Théâtre Français has since the days of Molière been the subject of laws, rules, decrees, and orders of every kind. Besides the legislative enactments dealing with it, there are also many documents of a more secret nature bearing upon the finances of the society, its quarrels with authors and performers and the like, which form an essential part of a history of the subject. Such is the task undertaken by M. Bonnassies. Having explored from beginning to end the records, title deeds, correspondence, and other papers relating to his subject, he set to work, and has composed a volume which forms a very satisfactory addition to those we have above mentioned. The administrative history of the Théâtre Français embraces three periods, corresponding to as many divisions in the present work—the 1st, from the arrival of Molière at Paris (1658) to the decree of the Council (1757) which gave a legal sanction to the constitution of the society; the 2nd, from the second half of the eighteenth century to the Revolution, when the society was dissolved; and the 3rd, from 1799 to the present time. The volume before us gives only the first of these epochs, and will be followed by two others. It is curious not merely from the official details which it supplies as to one of the most thoroughly national establishments in France, but on account of the anecdotes it furnishes about the private lives of the actors, and their relations with the Court and the public.

M. Pricot de Sainte-Marie has written an interesting pamphlet† on the Southern Slavonic populations; and at a time when questions of nationality are so universally discussed a publication of this kind is opportune. Ducange, the author of the mediæval glossary, is the first French author who described the establishment and formation of the Slavonic kingdoms in ancient Illyria. Quite recently M. Hilferding in Russia, and M. Ratchki in Austria, have made valuable researches on the same subject; from these three writers M. Pricot de Sainte-Marie has derived the materials for his own work. The first part of his monograph gives the physical geography of the country inhabited by the Southern Slavonic peoples—that is to say, the Balkan peninsula; questions of origin are then examined, and the various opinions propounded are carefully weighed. In the second part we find a brief sketch of the history of ancient Illyria under the several régimes to which it was subjected, and the work concludes by a description of the formation of the Slavonic kingdoms in the Balkan peninsula from 630 to 810 A.D.

In publishing a part of his political memoirs, M. Jules Simon‡ has endeavoured to show the intimate connexion which exists between the origin of the Second Empire and its terrible catastrophe. The principal subject of his book is the Government of September 4, its acts and its attitude both towards France and towards foreign Powers; but in order to understand fully the responsibility it had assumed after the capitulation of Sedan, it was necessary in the first place to consider the circumstances which had led to the Prussian war, and to show how the state of things developed by the Imperial system had rendered the humiliation of the country inevitable. It is always a matter of regret when a statesman, in order to justify himself, is obliged to accuse those whose position he occupies, but in the present case no other alternative was possible. M. Jules Simon begins therefore by describing the *coup d'état* of 1851; he shows us the manner in which it was prepared, the resistance it encountered, and the unscrupulous measures resorted to by the Prince-President to re-establish despotism. The foreign policy of the Empire forms the subject of the second part of the volume. The author accuses Napoleon III. of having most effectually contributed to the development of Prussia by allowing the dismemberment of Denmark and the ruin of Austria. After such a Machiavellian course of policy was it not madness, he asks, to attack Prussia? to attack it especially (as he assumes) against the wish of France, with unprepared means of action, and merely for the sake of establishing on a firmer basis a tottering dynasty? Such is the line taken by M. Jules Simon in a book written, no doubt, under the influence of strong party feeling, but at the same time in a dignified and calm style. The volume will prove an important *mémoire à consulter* on the events of the last twenty years.

The work of M. Clamaguran on Algeria partakes of the twofold character of *impressions de voyage* and of a political treatise§; it was suggested to the author by the perusal of the last chapter of M. Provost Paradol's *France nouvelle*, and it consists of a series of articles originally published in a review. M. Clamaguran's object is to show the importance of Algeria as a means of counterbalancing the ever-extending power of the Teutonic, Slavonic, and Anglo-Saxon races, and as a kind of vantage-ground for France, the representative and the champion of Latin civilization. His narrative is complete and interesting; he discusses not only political and economic questions, but also topics connected with natural history, ethnology, and agriculture; he describes the re-

sources of the colony, speaks of the improvements which might be introduced into the administration, and, in short, gives us a valuable hand-book for Algeria. His remarks on the institutions of Kabylia form an appropriate supplement to the volume.

M. de Guernon-Ranville,* whose Memoirs are now published for the first time, was one of the most distinguished members of Prince Polignac's fatal Ministry, and alone, we believe, amongst his colleagues protested against the ordinances which brought about the Revolution of 1830, and which, he remarked, were *inutiles et impuissantes à rien altérer*. If the *coup d'état* contemplated by Polignac was a blunder, what shall we say of the measures taken to carry it out? If we may believe M. de Guernon-Ranville, whose authority is confirmed by other historians, there was a moment when the insurrection could have been easily crushed. No one, however, seemed capable of giving advice. Marshal Marmont's conduct in particular is inexplicable. Even supposing that he did not behave treacherously, his strategic arrangements were utterly absurd and ridiculous. M. de Guernon-Ranville is right when he praises the diplomatic qualities of Prince Polignac; he is right also when he deplores his senseless obstinacy, and his complete inability to cope with events which he knew not how to foresee or to meet. The scenes in the fortress of Ham, where the ex-Ministers were confined after their trial, are not without a certain disagreeable interest. It is painful to read the narrative of those perpetual squabbles among four clever men who, having nothing to do, spend their time in accusing one another, and making their captivity still more tedious than it really was by unprofitable recriminations.

M. F. Maillard has already contributed two interesting works to the popular literature of Paris during the war and the Commune. His *Histoire des journaux*, followed by the *Affiches et professions de foi*, is amusing, and at the same time full of historical interest. His present duodecimo gives an account of the songs, pamphlets, and satires which were sold through the streets, and which professed to give patriotic revelations about the heroes of the day, together with suggestions for the defence of the capital, the safety of France, and the happiness of the human race. M. Maillard has analysed no less than 435 of these documents, adding an index and a table of the authors. An amusing vignette on the title-page represents a *chiffonnier* picking up amidst a heap of rubbish some of these squibs or caricatures, and exclaiming, "Dire pourtant que tout ça c'est de l'histoire!" We hope that on some future occasion M. Maillard will recast his amusing *catalogues raisonnés*, complete them, arrange them into a single work, and then we shall have an excellent supplement to the bibliographical volumes of M. Hatin, M. de Labédoyère, M. Deschamps, and M. Marron. Just as the *Mazarinades* throw much light upon the war of the Fronde and the minority of Louis XIV., so the newspapers, bills, pamphlets, and the like enumerated by M. Maillard contribute to make us acquainted with the character of the Parisian mob during the last revolution.

Our neighbours have lately had such an epidemic of "physiological" romances that they must be heartily glad to read something in a purer style. At any rate we can cordially recommend M. Fiévée's *Légendes militaires*†; they are two in number, and written in a dashing manner which reminds us a little of Alexandre Dumas. The Regiment of Champagne might well be proud of its history; after having defended Mézières under the command of Bayard, and driven away Charles V. of Austria from the walls of Metz, it now preserves the island of Saint-Martin de Rhé to France, and, led by the valiant Marquis de Thoiras, it defeats Buckingham and the English fleet. The romantic part in this stirring legend is performed by the celebrated Marion de Lorme, who appears under the name of Fidès. The second story belongs to the eighteenth century, and its real subject is the rivalry between two regiments (Auvergne and Piedmont), a rivalry which manifests itself by daily duels. The Marquis de Castries, commanding the French troops, has resolved upon making an example, and he condemns to death his own son-in-law, M. de la Rochetournoi, who had challenged and killed an officer in the Regiment of Piedmont. The exasperation has reached its height, when the victory of Clostercamp and the death of the Chevalier d'Assas obtain what M. de Castries could not accomplish. The reconciliation between the two regiments takes place on the battle-field.

M. Octave Feuillet's latest productions will certainly not add much to his reputation. *M. de Camors* was already a strange departure from that style which had obtained for the author the nickname of *Musset des familles*, but *Julia de Trécaur* is infinitely worse‡; it is enough to say that it is the novel from which has been taken *Le Sphinx*—the nauseous play now performed in London, after having obtained such success on the other side of the Channel.

Count de Gobineau, at present ambassador in Sweden, is especially known for several excellent works on Oriental history and archaeology. We are sorry that we cannot give to his novel *Les Pliades*§ the same praise that we bestowed on his *Traité des écritures cunéiformes*. We have called the book a novel; but

|| *Les Pliades*. Par le comte de Gobineau. Paris: Plon.

it is rather a series of portraits, a sceptical analysis of the human heart composed in the style of M. Mérimée and M. Bayle. The characters are all more or less disagreeable, besides being extremely tedious, for they do scarcely anything but *talk de omni re scibili*: It is clear that Count de Gobineau is the literary follower of the *Inconnu's* correspondent; we much regret it, for the incontestable talent which appears in the *Pliades* might have been better employed. The champions of the "new social strata" will not forgive our author for describing the demagogues as "reptiles crawling on the steps of power" and as a combination of "rascals, brutes, and fools."

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

The SATURDAY REVIEW is duly registered for transmission abroad.

FOURTEENTH CHURCH CONGRESS, BRIGHTON, 1874.
OCTOBER 6, 7, 8, and

PROGRAMMES AND TICKETS ARE NOW READY.

Members' Tickets not transferable: 5s. each, admitting Ladies and Gentlemen to all the Meetings of the week, except the Free Meeting for the Working Men on Thursday Evening, for which a limited number of Special Tickets for Members of Congress only may be had at 2s. 6d. each. Applications by letter must be accompanied by a remittance, and name and address of every one for whom a Ticket is required. The Committee do not recommend payment to be made by stamps; but if so made, two extra stamps must be sent for each Ticket. P.O. Orders should be made payable to

FREDERICK M. WELSFORD, Acting Secretary.

Temporary Office: Central Schools, 104 Church Street, Brighton.

Personal attendance from Ten till Two.

ST. THOMAS'S HOSPITAL, Albert Embankment, Westminster Bridge, S.E.—The MEDICAL SESSION for 1874 and 1875 will COMMENCE on Thursday, October 1, 1874, on which occasion an ADDRESSES will be delivered by Mr. MACCORMAC, at Two o'clock.

Gentlemen entering have the option of paying £40 for the First year, a similar sum for the Second, £20 for the Third, and £10 for each succeeding year, or, by paying £105 at once, of becoming Perpetual Students.

Any further information required will be afforded by Mr. WHITEFIELD.

OWENS COLLEGE (MANCHESTER ROYAL) SCHOOL OF MEDICINE.

Principal: J. G. GREENWOOD, LL.D.

Director of Medical Studies: GEORGE SOUTHAM, F.R.C.S.

PROFESSORS AND LECTURERS:

General Anatomy and Physiology ..	William Smith, F.R.C.S.
Practical Physiology and Histology ..	Arthur Gamgee, M.D., F.R.S.
Descriptive and Practical Anatomy ..	(Morrison Watson, M.D.)
Chemistry ..	J. Bewick Perrin, M.R.C.S., F.L.S.
Comparative Anatomy and Botany ..	W. C. Williamson, F.R.S.
Medicine ..	Henry E. Roscoe, B.A., Ph.D., F.R.S.
	(William Roberts, M.D., B.A., F.R.C.P.)
	(John E. Morgan, M.D., M.A., F.R.C.P.)
Surgery ..	(George Southam, F.R.C.S.)
	(Edward Lund, F.R.C.S.)
Ophthalmology ..	Thomas Windsor, M.R.C.S.
Pathology and Medical Anatomy ..	(Henry Simpson, M.D., M.R.C.S.)
	(Julius Dreschfeld, M.D.)
Midwifery and Diseases of Women and Children ..	John Thorburn, M.D., L.R.C.S.
Material Medici and Therapeutics ..	(Alexander Somers, M.R.C.S.)
	(Daniel John Leach, M.B.)
Forensic Medicine ..	G. Morley Harrison, M.R.C.S.
Hygiene and Public Health ..	Arthur Ransome, M.D., M.A., M.R.C.S.
Clinical Medicine ..	The Physicians to the Royal Infirmary.
Clinical Surgery ..	The Surgeons to the Royal Infirmary.
Medical Tutor ..	J. Bewick Perrin, M.R.C.S., F.L.S.

The Winter Session will commence on October 1. The new Medical School Buildings will be opened on October 3 by Professor T. H. HUXLEY, F.R.S. A nomination fee of £5 in one payment, or in two payments of £25 each, with an annual tutorial fee of £2 10s., admits to the complete course of study at the School, and a further sum of £40 to the Hospital Practice at the Royal Infirmary.

Prospectuses will be forwarded on application.

J. HOLME NICHOLSON, Registrar.

GERMANY, FRANCE, AND EUROPE.

IF the French feel any annoyance at the German celebration of the anniversary of Sedan, the journalists who may be supposed to represent public opinion have with good sense and dignity abstained from expressing their resentment. It was not indeed to be expected that M. VICTOR HUGO should be content to suppress his hysterical patriotism. The greatest of living French writers is always careful to remind his countrymen that genius is compatible with the silliest affectation. Having perhaps exhausted the capabilities of simpler language, M. Hugo has apparently persuaded himself that superlatives are intrinsically sublime. A precisely similar combination of emphasis with weakness is furnished by habitual use of the profane expletives which have gradually been eliminated from ordinary conversation. The POPE himself, though he has the excuse of reproducing the traditional forms of ecclesiastical commination, may be considered to practise a decent reserve when he denounces his supposed gaolers, in comparison with M. Hugo in his invectives against Germany. When the enemy was advancing after the victory of Sedan, M. Hugo announced that Paris remained tranquil and serene, and that a volcano required no assistance or exhortation. Now that there is no immediate cause of quarrel, and while on his own admission France is still unprepared to renew the struggle, M. Hugo informs a so-called Congress professedly bent on the establishment of perpetual peace that a war of revenge is the indispensable preliminary of the philanthropic millennium. It would scarcely be worth while to notice the wilful extravagance which degrades a great reputation, except for the purpose of contrasting M. Hugo's nonsense with the prudence of responsible Frenchmen. In this instance his absurd incentives to war are probably due to personal eccentricity; but his language in some degree explains the dread and dislike with which the orderly and respectable classes regard the Republican masses. It is impossible to ascertain whether M. Hugo addresses disciples who might on occasion translate his half-crazy rhapsodies, as in the days of the Commune, into action. The superiority of Germany over France consists, not more in military organization than in the disciplined loyalty which places the whole force of the nation at the disposal of a trusted Government. No German of position and fame would condescend to the utterance of impotent fury because his country might have incurred a disaster in war. The exhibition of democratic violence by M. Hugo will cause no uneasiness to the German Government.

If the Germans had simply celebrated the great triumph of Sedan on the anniversary of the battle, it would not become Englishmen to criticize their conduct. As long as the Duke of WELLINGTON lived, for a period of nearly forty years, the annual commemoration of Waterloo was popular in England. The close of the great war which had lasted almost without intermission, from 1793 to 1815 was in itself a sufficient reason for rejoicing. The accomplishment of German unity, although it dates from Sedan, ought not to offend French susceptibility, excepting as far as it involves the recovery of Alsace and part of Lorraine. It is impossible to distinguish the complacency produced by unprecedented military success from patriotic gratification in the attainment of a great national object, but it may be confidently said that in their recent rejoicing the Germans had no desire to express hostility to France. Bishop KETTLEER of Mainz did his countrymen an involuntary service by directing their attention to the political conse-

quences of Sedan rather than to the glorious achievements of the army. With an infatuation characteristic of the modern Romish hierarchy he took the opportunity of the proposed festivities to justify as far as possible the policy of Prince BISMARCK's Government, by the declaration that orthodox Catholics had no share in the national satisfaction. It was enough for his purpose that the Liberals were devoted to the cause of German unity. If the hated party of freedom was in the right, it only remained for the Catholics to prefer the wrong. Only an ecclesiastical bigot is capable of the imprudence of associating the success of his cause with national humiliation. The challenge offered by the Bishop in the name of his Church was accepted in all parts of Germany, nor were the Catholics lately backward in proclaiming their devotion to their regenerated country. The fanatic who lately attempted to murder Prince BISMARCK was scarcely a more dangerous adherent of his party than the intolerant Bishop of MAINZ. The admirers of the Papal system have often applauded the adroitness of the Roman Catholic Church in adopting with impartial sagacity any political theory which seems likely to serve its turn. In the present day the POPE and his agents allow temper to interfere too constantly with diplomacy.

The German Government will perhaps derive encouragement from the demonstrated weakness of its chief domestic adversaries; yet it would be a grave misfortune if European politics were subjected to the influence of religious disputes. Of the two French factions which precipitated the war of 1870, it is difficult to say whether the prelates who intrigued at Court on behalf of Rome, or the rabble to which M. VICTOR HUGO appeals, were more deeply culpable. At present the demagogues are comparatively reticent, while the Government is constantly embarrassed by the violence of episcopal sermons and pastorals. Bishop KETTLEER might have been contented with the ostentatious animosity to Germany of his co-religionists on the other side of the frontier. The same faction has succeeded in depriving France of all prospect of an Italian alliance. Nevertheless it would be in the highest degree imprudent to alienate the German Roman Catholics from the national interest. The Empire, as long as it is not troubled with internal dissensions, may reasonably hope to retain the ascendancy which it has acquired in Europe. Notwithstanding some indications of a disposition to adopt a meddling policy, it is incredible that the ablest of contemporary statesmen should provoke unnecessary quarrels. It is not the winner who is usually anxious to play the game over again. Russia and Austria are at the same time strong and pacific, and both have a friendly understanding with Germany, and probably with one another. The Emperor of AUSTRIA has on his visit to Prague been, for the first time in several years, cordially welcomed by the Bohemian population as well as by the Germans. The change is probably due to the intermission of Russian intrigues with the Slavonic subjects of the Austrian Empire. Hungary is equally loyal, though Kossuth, with the doggedness of an incurable demagogue, continues to address to the unwilling ears of his former adherents appeals in favour of the national independence which has been revived in another form without his assistance. Russia has for the present sufficient occupation in Asia, and the Imperial Government has for the time definitively adopted towards Turkey a policy of patronizing and friendly expectancy.

In spite of bishops and poetic incendiaries the French Government pursues a prudent course of foreign policy. Marshal MACMAHON and the Duke DE CASSES might perhaps

have acquired a temporary popularity by refusing to follow the lead of foreign Powers, and especially of Germany. The dignity as well as the interest of France was better consulted by the despatch of a representative to the Conference assembled by Russian influence at Brussels, and by joining in the recognition of the Government of Madrid. Domestic uncertainties have not been allowed to interfere with the reorganization of the army, and, although the Government is not exempt from financial difficulties, the credit of France has not been impaired. M. Hugo indeed boasts that there was something beyond credit in the alleged offer of eighteen hundred millions sterling when the Government proposed to borrow two hundred millions. Prosaic financiers would prefer the confidence of selfish capitalists to the enthusiasm which, according to the Jacobin faith, attaches mankind to France and to Paris. The same world which is said to have offered the enormous loan cannot, according to M. Hugo, accept the diminution of France. He further asserts that, by some mysterious operation, "the five milliards once paid, 'Berlin was no richer and Paris no poorer.' If the transfer of a vast sum leaves both parties to the transaction as they were, the extortion of ransom supplies no ground for resentment or revenge. The explanation of the paradox, which is as unintelligible as the riddle itself, consists in the proposition that "Paris is necessary to mankind and 'Berlin is not.'" Rational Frenchmen prefer any form of government to the supremacy of a faction which may perhaps count a vapouring poet among its leaders. It is true that those Republicans who possess a political instinct are for the present not eager to renew an unequal struggle with Germany. During the President's recent tour a part of the population expressed a desire for the establishment of the Republic; but the bishops were the only advocates for war, and their denunciations were directed rather against Italy than against Germany. One of the many elements of the national aversion to a Legitimist Restoration is the suspicion that the Count of Chambord would be compelled to adopt for his own sake a warlike policy.

LORD RIPON.

THE profound ignorance of English character which distinguishes the proselytising section of the Roman Catholics is illustrated by their triumphant welcome of conspicuous converts. It would be improper to discuss the reasons or motives which may have induced Lord Ripon to join the Roman Catholic Church; and it may readily be admitted that he is the most eminent in position of all laymen who have seceded in recent times. He is the son of a Prime Minister; and two earldoms acquired in the course of a century by different branches of his family have become united in his own person. The popular sympathies of his youth were rewarded by a seat for a great constituency and by the consequent attainment of high office at an early age. Having acquired credit as Under-Secretary for War at the time when the Volunteers were first organized, Lord DE GREY was chosen by Lord PALMERSTON as Secretary of State for the same department, at a time when some members of the Government strongly urged the superior claims of Lord CLARENDON to a place in the Cabinet. As President of the Council in Mr. GLADSTONE'S Administration Lord DE GREY cordially supported the policy of Mr. FORSTER, who, as the representative of the office in the House of Commons, was necessarily charged with the conduct of the Education Bill. The discredit of negotiating the Washington Treaty attaches rather to the Cabinet which exercised incessant control over the plenipotentiaries, than to Lord DE GREY and his colleagues in the mission; but he must share with Mr. GLADSTONE the reproach of want of taste in the offer and acceptance of a step in the peerage to commemorate the submission of his country to an overbearing adversary. His new associates will perhaps fail to draw the true inference from the recapitulation of the principal events of Lord RIPON'S biography. It is remarkable that it should be generally and justly assumed that with his conversion to another creed his political career is closed. Lord RIPON will retain his social rank as a nobleman of unblemished character and large fortune; nor would the most inveterate Protestant bigot attribute to him any dishonourable motive for proclaiming his new convictions at a heavy sacrifice on his own part. The surrender of all the objects of his former ambition may be in a certain sense repre-

sented as meritorious; but the fact that it is inevitable and final deserves some consideration. Orthodox Roman Catholics of course hold that their doctrine is true; but, if they are intelligent and candid, they must confess that it is rejected by the English nation with an invincible prejudice of repulsion.

The more dispassionate section of society rather understands than shares the feeling of the majority; but in all classes distrust of Roman Catholic policy has greatly increased of late years. Lord MELBOURNE said, with humorous exaggeration, that all the fools had been opposed to Catholic Emancipation, and all the wise men had supported it, and it turned out that the fools were right; yet at that time more than one Roman Catholic member represented an English constituency; Mr. SHELL, a nominal Roman Catholic, held office without provoking popular clamour, and Mr. O'CONNELL himself was courted by English Liberals. The absurd episode of the Papal Aggression and of Lord JOHN RUSSELL'S Ecclesiastical Titles Bill disturbed the truce which had been practically established. Neither party has reason to recall willingly the encounter of folly with folly; but Cardinal WISEMAN was responsible for beginning the mischief. Nearly twenty years elapsed before a Roman Catholic again occupied an independent English seat, and it happened that Sir JOHN SIMON was one of the few converts who resolutely resisted the political dictation of the hierarchy. Mr. MONSELL held office of secondary rank in Mr. GLADSTONE'S Government; and it was supposed that he was a principal promoter of the unlucky Irish Universities Bill. His name had previously been little known in England; and his conversion had occurred while he occupied a private situation. It is difficult to distinguish between the sectarian element of the popular feeling and its more reasonable grounds. The presence of several Jewish members in the House of Commons shows that theological difference of opinion is not regarded by constituents as a political disqualification. For several years the election for the City of a Jewish member, who was at that time unable to take his seat, was considered by the Liberal party both a protest in favour of sound principles and a periodical triumph. There are at present Jews in Parliament whose abilities would qualify them for high office, and it may be confidently asserted that their elevation would be regarded with indifference or approval. If the Romish Church had maintained the unobtrusive attitude of fifty years ago, the political suspicion which attends it would not have existed in England. The Jews, though they happen to be aliens in blood, are acknowledged as Englishmen, because they have no corporate interests or wishes antagonistic or anterior to the welfare of the country. Romanist converts, on the other hand, ostentatiously proclaim that they are Catholics first and Englishmen afterwards, nor have they any right to complain if they are taken at their word. A railway shareholder who thwarts the measures of his Company because he holds a larger stake in a rival undertaking is not likely to command the confidence of his partners. Even if every article of the modern Romish Creed were indisputably true, a patriotic statesman ought still to regard the national interests as paramount to the policy of the Church.

Lord Ripon himself has furnished a casual illustration of the officious interference of the Romish Church with secular freedom of action. His unexplained resignation of the highest office in the Society of Freemasons was the first public announcement of his intended change of religious profession. The condemnation of the Freemasons by the Pope is at the same time capricious and easily explicable. In Italy and in some other Continental countries the organization of the Society has sometimes been employed for their own purposes by political conspirators and religious malcontents. The Roman Court was perhaps imperfectly acquainted with the relations between Freemasonry and heretical disaffection; and the Pope, like HEROD, thought that a massacre of the innocents was the most certain method of reaching his immediate victim. Accordingly, not only the Freemasons, but all secret societies, are included under one comprehensive curse, although Freemasons, Foresters, and Odd Fellows are, in England at least, wholly guiltless of hostility to any State or to any Church. Cardinal Cullen, when he has from time to time occasion to denounce the Fenians, always extends his anathemas to Freemasons, partly for the sake of insulting that innocuous body, and partly to intimate that the Fenians err rather in disobeying the Pope than in plotting against the Crown. Those who know nothing of the

symbols of Freemasonry are entitled to assume that its little mummeries and its practical objects are harmless or laudable, because many persons of rank and character, including the PRINCE OF WALES, have presided over its mysteries; and especially because ten days ago Lord RUPON was Grand-Master of the Order. By renouncing the dignity as a condition of his admission to the Romish communion, Lord RUPON submits to the commands of the Holy See in a matter which, as he himself positively knows, concerns neither faith nor morals. In other words, he admits the authority of the Church to define its own limits, and to include at pleasure any part of the temporal province within its spiritual dominion. Freemasonry is a trifle; but the power of converting a harmless trifle into a mortal sin involves the assumption of an unqualified supremacy over human actions.

If men were consistent, and if systems were uniformly logical, there might be a difficulty in questioning Lord MONTAGU's conclusion that the fools who opposed Catholic Emancipation were in the right. In practice, born Roman Catholics are found to be loyal, and even converts are from time to time unavoidably left to themselves by their spiritual guides. It is only in the romances of EUGENE SCAROT or of zealous Protestant writers that the Jesuits are ubiquitous and omniscient. The principal managers of the Roman Catholic organization are in the habit of plotting with transparent simplicity, as when they make devout noblemen ridiculous by sending them to lead obsolete pilgrimages. The blandishments which they lavish on wealthy and high-born proselytes have unfortunately proved in several instances successful; but if the priests had won over the whole peerage of the United Kingdom, they would incur the disappointment of the proverbial purchaser of PENN. The converted body would have forfeited the political power which the short-sighted Church had coveted for itself. On the middle classes propagandism has never established a hold, although a dozen town councillors would be a greater acquisition than *Lothair*. But for the Irish immigration the number of Roman Catholics in England would be so utterly insignificant that the community would be little more than an aristocratic club. The political importance of the Roman Catholic Church in the United Kingdom consists wholly in its command of a large part of the population of Ireland; and the democratic agitation in which the Irish priests have long been engaged repels the sympathy of the English Roman Catholics, with the exception of a few enthusiastic converts. The priests are politically opposed to the gentry of their own connexion, and they probably feel little confidence in ardent proselytes of the type of Sir G. BOWYER and Lord ROBERT MONTAGU, who are willing in their zeal for Rome to sanction the dismemberment of the Empire. An accurate calculation of gain and loss would perhaps show that the Roman Catholic Church has made but an unprofitable acquisition. It has inflicted a certain degree of annoyance on its adversaries, and it has secured for its own objects the control of a large fortune. On the other hand, it has advertised its own incurable unpopularity by reminding the unobservant world of the unwritten political disabilities which have survived Catholic Emancipation.

FRENCH PARTIES.

THE election for the department of the Maine and Loire which will be held to-morrow has brought out plainly the four parties into which political Frenchmen are divided. The Republicans, the Orléanists, and the Bonapartists have each a candidate; the Legitimists have determined not to run a candidate of their own, but they have pointedly refused to have anything to do with the Orléanist candidate. Whether their votes will be largely given to the Bonapartist candidate is uncertain, but not even the prospect of an Imperialist or a Republican victory can induce them to support M. BRUAS. The breach between the two sections of the Royalist party seems to grow wider every day. If it is hard to forgive a man who has tricked you, it is harder still to forgive a man who has been accessory to your tricking yourself; and this is the light in which the Legitimists regard the Orléanists. They hold that all the good which was effected by the Fusion has been undone by the Septennate. Yet the Septennate could never have been set up if it had not been for the co-operation of the Legitimists. It was the special creation of that Conservative majority of which the Extreme Right

formed an integral part. They asked Marshal MACMAHON to mount on their backs, and they are now discomfited to find that he has no intention of getting off again until his seven years' ride is done. If the Orléanists had established the Septennate without Legitimist aid, the crime might have been condoned from considerations of convenience; it is the sense that this aid has been given that makes their resentment so bitter and so persistent. By the vote of the 19th of November 1873, French Conservatism became associated with a form of government which was not immediately or directly monarchical. Those who devised the Septennate hoped, no doubt, that it would lead to a Restoration in the person of some less impracticable sovereign than HENRY V. But they confessed by their vote that the prospects of a Restoration were distant and indefinite, and that in this state of things it was incumbent on them to secure the essentials of regular government, even at the cost of surrendering for the time the form which they loved best. In this the Orléanists were perfectly consistent. The result has proved that they were over-sanguine in thinking that the essentials of regular government could be secured by so provisional an expedient as the Septennate; but in postponing their endeavours after a Restoration to a more convenient season they sacrificed no principle. Royalty with them is a very precious form, a form which many of them hold to be inseparable from the substance of good government in France, but in theory it is only a form. With the Legitimists, on the contrary, royalty is part of the substance of good government, since without royalty there can, at all events in countries which have once enjoyed it, be no legitimate government at all. The strange thing is that men possessed of this conviction should ever have brought themselves to vote for the Septennate. They now declare that they did so in the belief that their vote pledged them to nothing more than the acceptance of Marshal MACMAHON for just so long as might suit their own purposes. It is difficult, however, to accept this as a true version of the facts, inasmuch as the discussion turned in part upon the period for which Marshal MACMAHON's powers should be extended. It is conceivable that seven years should have been inserted as a mere formality, but for this purpose ten years would have done equally well. When the Government assented to seven years by way of concession to those who opposed the ten years' limitation, they showed unmistakably that both figures were meant to stand for substantive periods.

The omission to start a candidate of their own in the Maine and Loire must be taken as an indication of conscious weakness on the part of the Legitimists. The explanation is one with which Englishmen are familiar. The Legitimists are reserving themselves for the general election. But their future chance of success in a general election is not likely to be more than the sum of their present chances of success in particular elections. If they cannot return a candidate in the Maine and Loire this year, what reason is there to suppose that they will be any better able to return one next year? Their leaders do not pretend that their cause is growing in popularity; on the contrary, they have often stimulated the activity of their followers by the argument that, if a Restoration cannot be effected by the agency of the present Assembly, it will not be effected by the agency of the next Assembly. Now the Legitimists in this particular constituency have suddenly discovered that it is on the next Assembly that their hopes are really built. There is no longer, they say, any probability that the Conservative majority will be brought to admit the fault of which it was guilty last November, and so long as it refuses to admit it the Extreme Right must continue to stand apart from Parliamentary combinations. There is no doubt that, if this threat is carried out, a dissolution must speedily follow. If the Extreme Right are really weary of the Assembly, it rests with them to send it about its business. M. JULES SIMON has pointed this out in a speech which he has just made at Rheims. The Assembly, he says, cannot be dissolved except by its own act. "A revolt against a Chamber elected by universal suffrage would be a crime." Englishmen will not be disposed to hold that a revolt against a Chamber elected by universal suffrage is worse than a revolt against any other established Government; but the recognition of legality as a ground for respect has not been so common among French Republicans as to dispose us to quarrel with even an exaggerated display of it. Now, though the Left has immensely increased in strength, and can now number 310 votes, it is not strong enough by itself to effect a dissolution by the act of

the Assembly. To do this it needs twenty additional votes, and this is more than the partial elections can possibly give it. There is no hope of detaching any votes from the Right, for, though the Right is divided on many points, it is united in its hatred of the Republic. The natural inference from this analysis would seem to be that the Right will be united in resisting that dissolution to which the Left looks for the triumph of the Republic. But M. JULES SIMON draws a different conclusion. He thinks that the Extreme Right will join the Left in voting for a dissolution. This would have seemed a most improbable event had it not been for the line taken by the Legitimists in the Maine and Loire. But if the leaders of the Extreme Right decline to start candidates on the plea that it is no use to take any trouble about the existing Assembly, and that they are saving themselves for the general election, they cannot in decency refuse to hasten that general election when they have the opportunity. The fear is, however, that this language may not be the expression of any genuine change of opinion on the subject of dissolution, but merely a hastily devised excuse for local inability or unwillingness to stand the expense of a contested election. In that case M. JULES SIMON may find that he has counted his chickens prematurely.

The Government has been compelled to give fresh offence to the Extreme Right by suspending the *Univers* for an article attacking Marshal SERRANO. We say compelled, because so long as the state of siege is maintained in Paris it is idle to expect that foreign Governments will not take advantage of it for their own purposes. It is of great importance to Marshal SERRANO that the French Government should not be supposed to wish the Carlists well. If the authorities on the frontier were perfectly clear upon this point, they would take a more decided line as regards breaches of neutrality than they have yet seen their way to. French officials are very apt to read between the lines of their instructions, and to interpret them by the spirit in which they fancy that they were written. It will be difficult to attribute any latent sympathy with the Carlists to a Government which suspends Conservative newspapers for pleading the cause of the Pretender. If the Governor of Paris had possessed no exceptional powers over the press, Spain could not have called upon the French Cabinet to do on behalf of another Government what it had not the means of doing on its own behalf. But so long as Paris newspapers continue to live at the mercy of the General commanding the Twentieth Military Division, Marshal MACMAHON'S Ministers must put up with having to punish them under pressure from foreign Powers. If they wish to avoid the unpopularity which such acts provoke, they must be content to surrender the imaginary advantage of being able to suppress discussion on their own measures.

SPAIN.

THE late change of Ministry at Madrid is attributed to the influence of Marshal ZABALA; but the objects which may have been contemplated or attained in the substitution of one set of obscure names for another have not been explained. It is a plausible conjecture that the retiring Ministers were less wholly under the control of SAGASTA than their successors will be. Marshal SERRANO has probably sufficient occupation in the superintendence of military affairs; and he may be glad to entrust the management of political details to the experienced chief of his Cabinet. The same industry and capacity for political intrigue which raised SAGASTA to Parliamentary eminence are apparently found useful under the veiled absolutism of a provisional dictatorship. If it should hereafter be thought expedient to give the Government a constitutional colour by the convocation of a Cortes, SAGASTA understands as well as any competitor the theory and practice of Spanish elections; and he will perhaps have learned to avoid the error which he committed during his former tenure of office, of returning through his agents a too unanimous Parliament. His ancient colleague and rival ZORRILLA seems to be inclined to abandon, in imitation of SAGASTA, the retreat to which he has carefully confined himself since the proclamation of the Republic. His announcement to his political friends that he is not yet prepared to return to public life may be regarded as a notice that his services will be available to the Government of the day if the present Ministers should incur discredit or disaster. It is one of the felici-

ties of Spanish politicians that none of them even in disgrace or exile need despair of an early return to power. Two years ago SAGASTA'S party was broken up, while ZORRILLA directed the Government with the support of an overwhelming majority in the Cortes. CASTELAR was the eloquent leader of an Opposition weak in numbers. SERRANO was on the eve of attaining an easy triumph over the Carlists, who were beginning to rise in the Northern provinces. A few months afterwards SERRANO escaped with difficulty and in disguise from Madrid, ZORRILLA and SAGASTA disappeared into safe obscurity, and CASTELAR, after an interval of anarchical agitation, became for a time dictator of Spain. It is now again the turn of SERRANO and SAGASTA, and probably the wheel of fortune will complete its round. The only change for the better consists in the tranquillity which has followed the exposure of the incapacity of the Republican faction.

It is not yet known whether Marshal ZABALA is to resume the command of the army in the field or to make room for MORIONES and LOPEZ DOMINGUEZ. No Spanish general has succeeded to the reputation of CONCHA, which was as valuable to the country as his military skill. Little has been lately heard of General PAVIA, who has acquired a merited reputation both by his restoration of order in the South and by his seasonable expulsion of the Republican Cortes. It is perhaps not the fault of the generals that the army is still too weak in numbers to take the offensive on a considerable scale. LOPEZ DOMINGUEZ has succeeded in relieving Puycerda; but the Madrid Government has since the death of CONCHA failed to recover any part of the territory which had been occupied by the enemy. From time to time reports are circulated that the Chief of the Executive Government intends to take the command in person; but it may be doubted whether Marshal SERRANO would prove a more efficient general than his lieutenants, and he has everything to lose by failure. He has been present in the field only once during the campaigns of the present year, when a sufficient force had been accumulated to ensure the relief of Bilbao. Even on that occasion Marshal CONCHA was charged with the conduct of the most important operations, and SERRANO was content with the second honours of the success which was achieved. It is possible that he may again take the opportunity of refreshing his military reputation, when he has completed the reinforcement of the army, and when he is prepared to drive the Carlists from their positions round Estella. He may perhaps trust SAGASTA to administer affairs in his absence, especially as no rival could claim the title which he derives from the courtesy of foreign Governments. The Ministers of the different Powers are accredited, not to the Spanish Republic, but personally to Marshal SERRANO as the actual head of an undefined Government. In the event of SERRANO'S death, or expulsion from office, the whole question of recognition might be reopened, although it is probable that any successor who was thought capable of maintaining order would be acknowledged with little difficulty. Undisputed authority and probable permanence are the chief conditions which entitle a Government to represent a nation.

A Republic of the type approved by CASTELAR would find little favour with the European Powers. It is at least probable that the main cause which has induced the Russian Government to withhold its recognition is unconnected with the circumstances of Spain, which lies, according to a St. Petersburg paper, as much outside the sphere of Russian policy as Japan. It has been thought expedient to show that the cordial friendship between the two great Empires of the North implies no subservience of Russia to Germany. The Brussels Conference and the delay in the recognition of the Spanish Government are intelligible, though unnecessary, assertions of independence. The policy of Germany towards Spain, and the motives of the Carlists for attempting to provoke a quarrel with Germany, are equally mysterious. The French Legitimist papers had almost a plausible pretext for suggesting that the Germans themselves must have contrived the attack of the Carlist batteries on the German gunboats. If it is true that a train conveying the German and Austrian Ministers has also been threatened by Carlist bands, it would seem that, in despite of their own obvious interests, the insurgents are really bent on provoking a foreign adversary to assist their native opponents. Don CARLOS and his advisers are scarcely capable of relying on the far-fetched calculation that German hostility might procure them the active assistance of France; but there is no doubt that a French alliance would far more

than compensate for the intervention of a German contingent in the civil war. It is difficult to estimate the effect on Spanish public opinion of the employment of a foreign auxiliary force. It is true that no nation is more jealous of alien influence, but the allies of Spain have had cause to complain rather of subsequent ingratitude than of the immediate rejection of their aid. The English army was allowed to fight the battles of Spain in five or six successive campaigns, though the services which were rendered to the national independence have long since been forgotten. The auxiliary Legion under Sir DE LACY EVANS was welcomed by the adherents of the QUEEN in the former Carlist war, and a German division might decide the present contest without the risk of permanently disturbing the vanity of the nation or of the army. German officers, though they have been trained in the strictest traditions of regular warfare, are as well qualified to deal with insurgent mountaineers as with the popular levies of France. If Germany, and Germany alone, should interfere in the civil war, its result would not be doubtful. The cost of such an expedition would be insignificant to a Power which at all times keeps on foot an army numbering hundreds of thousands of men; yet Prince BISMARCK would forfeit much of his well-earned reputation for sagacity if he unnecessarily embarked in an enterprise involving many unforeseen issues.

The main objection to foreign interference in a domestic contest is that it might not improbably be the commencement of a more formidable war. The French already regard with natural irritation and jealousy the appointment to the German Consulate at Bayonne of an active and confidential agent of Prince BISMARCK. The inquiries which the Consul has instituted into the strict observance by French functionaries of the duties of neutrality are offensive to national feeling in proportion to the importance and accuracy of their results. If the Carlists have been unduly favoured by French functionaries, the right of complaint belongs to the Spanish and not to the German Government. The majority of Englishmen tolerated with some difficulty the vituperation of the Northern Americans during the Civil War on account of alleged sympathy with the South. If a third Power had undertaken to remonstrate against supposed infringements of neutrality, its remonstrances would not have been so patiently received. Spanish civil wars have rarely been for any long time unconnected with European politics. The Quadruple Alliance of England, France, Spain, and Portugal forty years ago was understood as a protest against the system of the Holy Alliance which was still maintained by Russia, Austria, and Prussia. Although the French Government is with good reason anxious to avoid any occasion of war, it might be difficult to acquiesce without some counter-demonstration in the despatch of a German expedition to Spain. There is no field of action in which France could encounter Germany with so many advantages; and it must be remembered that, notwithstanding the popularity of the German navy, France is still, as during the last war, more than a match at sea for her recent adversary. The considerations which appear conclusive to external observers can scarcely have failed to occur to Prince BISMARCK.

THE BRENTFORD GUARDIANS.

THE continuance or non-continuance of pauperism is more than anything else a question of the degree of intelligence which the ratepayers of each Union bring to the treatment of the paupers whom they have to support. They are under a constant and natural temptation to sacrifice future to present gain; to spend less money on the relief of the poor to-day, regardless of the certainty that they will thereby have to spend more money on the relief of the poor to-morrow. The Brentford Guardians have lately been remarkable for their persistence in this injudicious economy. They have pinned their faith to the proverb "A penny saved is a penny got," forgetting that even among proverbs the other side of the question has its representative, and that it is at least equally true that a stitch in time saves nine. This holds good even of adult paupers. It is not the most costly and the best managed workhouse that attracts most inmates; the cheap and badly arranged makeshift has far more charms for the indolent poor. The very essence of efficient poor relief is good workhouse discipline, and good discipline is unattainable without proper classification. Where paupers in

very different circumstances are crowded together, it is clear that they can only be dealt with after a rough and ready fashion. Under this system the man who can do least necessarily determines the treatment of the whole ward. The bulking idler, who rather than do a day's work will put up with the meagre fare of the workhouse, has his wish gratified because there is no proper means of separating him from the invalid whose strength only allows him to do in a day what an able-bodied pauper might do in a couple of hours. At Brentford the want of workhouse accommodation is so great that the Guardians are obliged to put indoor paupers into the casual wards at night because there is no other place in which they can sleep. Now if there is one principle of Poor-law administration more elementary than another, it is that men who choose to come into the workhouse shall not be able to combine the advantages of independent life with the advantages of a life led at other people's expense. For the able-bodied adult the workhouse ought to partake in some degree of the nature of a prison. He is protected against starvation, and so far his position is superior to that which he held out of doors; but to prevent this privilege from being abused it must carry with it the abandonment of the alleviations which makes the risk of starvation endurable. Otherwise the certainty of support would have irresistible charms for lazy or timid men. Amongst these alleviations, change of society is one of the greatest. In a workhouse which thoroughly answers its purpose there is no opportunity for this. The man who will not work finds that he gets very little to eat, and that this little has to be eaten, if not in solitude, at least among faces that he knows by heart, and likes none the better because he knows them. All the inmates lead the same dull life, and each knows almost before he hears it what the others have to say. In the Brentford Workhouse no such cruelty as this is displayed. The indoor paupers are allowed to keep up their knowledge of what is going on outside without making the journey thither for themselves. Each evening some of them have the opportunity of listening to the entertaining, if not improving, conversation of the tramps who are merely lodgers for the night. In this way they find in the workhouse the company, though not the drink, which they would enjoy in the beer-shop, and are in a position to study how to make a dishonest livelihood with least trouble when they can summon up sufficient energy to start on the tramp.

This is but a small part, however, of the Brentford Guardians' shortcomings. Their greatest error lies in the treatment of the children of whom, from one cause or another, they have the charge. A child who is bred in a workhouse, or who is accustomed to stay in one for long periods, necessarily runs a great chance of growing up a pauper. Early habits and early impressions cling very closely in after life, and though once a pauper always a pauper is not a rule without exceptions, it is a rule to which the exceptions are miserably few. This constant and pressing danger can only be averted by giving the children that moral and physical health which shall dispose and enable them to earn their own living when they leave the workhouse. Otherwise their departure will only be the matter-of-course prelude to their inevitable return. They will find themselves altogether unfitted to take their part in the struggle which awaits them outside, and they will have no sense of shame or strangeness to prevent them from coming back as soon as this unfitness is made clear to them. The representations made to the Guardians by Mr. HENLEY and Dr. MOUTT on behalf of the Local Government Board at the Conference held on Wednesday show how the necessity of physical and moral training is understood in the Brentford Union. For the last thirteen years the Poor-law Inspectors have been vainly urging the Guardians to transfer the children from the workhouse to a separate school. In 1861 Colonel PIGGOTT traced a virulent attack of skin disease to the insufficiency of cubic space in the children's wards. In 1866 and 1867 Dr. SMITH reported that the children had sore eyes from the overcrowded state of the schoolrooms. In 1870 and 1871 Mr. HENLEY found that the same cause had produced, or aggravated scrofula and ophthalmia. The Local Government Board has again and again called the attention of the Guardians to this state of things, but no regard has been paid to its remonstrances. We agree with Mr. HENLEY that the Board has done wisely in delaying any decisive action in the hope of inducing the Guardians to take a more intelligent view of the interests

which they represent. It must never be forgotten that it is the local authority that will have to carry out any improvements which the central authority may order, and that time may be gained in the end by a delay which brings the local authority to execute those improvements of its own free will, instead of having them forced upon it by others. But there is necessarily a limit to such forbearance, and in the case of the Brentford Guardians this limit has at length been overstepped. After thirteen years of arguing they are no nearer being convinced than when the controversy began. Any further hesitation on the part of the Local Government Board can only tend to strengthen the conviction of the Guardians that they are their own masters, and that, so long as the ratepayers are satisfied, they have a right to make the Brentford Workhouse a nursery-ground from which the pauper field may continually be stocked with new and promising plants.

By acting decisively now the Local Government Board will not depart, except in form, from the principle which has hitherto governed their relations with the Brentford Union. Up to this time they have given the Guardians law, in the hope that they would in time come to recognize the true economy of the reforms which have been pressed upon them by the Inspectors. The proceedings of Wednesday show that this hope is vain. The case put forward on the Guardians' behalf is not a string of excuses for not having carried out the official recommendations; it involves a flat denial of the policy on which those recommendations are founded. There is no reason to think, after thirteen years spent in trying to bring the Guardians to reason, that it can be worth while to waste any more years in a similar process. But though it is useless to aim at influencing the existing Guardians, it may not be useless to aim at influencing the ratepayers. The Brentford Union includes districts like Chiswick and Twickenham—districts, that is, in which there must be a very large number of ratepayers of the better class. It is probably not too much to say that a large proportion of these ratepayers have never given an intelligent vote on local matters in their lives. They have either not voted at all, or they have voted to please a friend without troubling themselves as to the merits of the question. But it is equally safe to say that they are interested in getting their rates reduced, and the disclosures of Wednesday will show them how this may be best effected. The Local Government Board represents the enlightened method of dealing with pauperism—the method which seeks to bring up the children who are on the rates in such a way as to prevent them from coming on the rates hereafter. The Board may make mistakes in carrying out its purpose—that contingency is inevitable from the difficult nature of the problem—but it keeps the purpose steadily before its eyes. The Brentford Guardians represent the old method of spending as little as possible on the children now on the rates, and making no account of the fact that a large majority of the children so brought up are certain to become paupers as soon as they come to years of discretion. At the next election of Guardians the respectable ratepayers throughout the Brentford Union will have an opportunity of showing which of these systems they prefer.

THE INTERNATIONALISTS AT BRUSSELS.

THE International Association, though it represents desires and delusions which are more or less vaguely cherished by large classes of people, and which are apt under certain circumstances to become explosive, has never in itself had any really substantial existence. A few years ago it made a great parade of its elaborate organization and formidable numbers, and an impression was spread that the leaders had only to give the signal and a multitude of devoted followers would at once appear to do their bidding. In point of fact, however, the Association was only a sort of paper mask behind which one or two experts in agitation made a great noise which frightened simple people. Here and there, scattered through the chief cities of Europe, were little groups of broken-down professors, obscure journalists, and ambitious artisans, who pleased themselves with the fancy that they were engaged in preparing a great revolutionary movement which was to change the whole constitution of society, and place working-men at the top, of course with the International seated firmly on their shoulders.

The Association made a great show of activity in the way of publishing manifestoes, and otherwise making believe that it had branches in all directions; and there can be no doubt that at one time it imposed upon the French Government, which endeavoured alternately to crush and to bribe it. It was natural that a society of this kind should attract to itself the sort of men who afterwards became prominent under the Paris Commune, and for a moment it almost appeared as if the International was at last embodied as a Government. In reality, however, although some of its members were identified with the Commune, the Association itself was too shadowy for any kind of practical effort. It is possible that it might in time have succeeded in acquiring the organization on the pretence of which it traded; but the political atmosphere has certainly not been favourable to the experiment. Internal dissensions, proceeding from the quarrels of rival leaders, have broken up the Society, and the delegates who have just been holding a meeting at Brussels represent only a fragment of the original body.

The chief object of this meeting appears to have been to demonstrate the hollowness and insignificance of the movement which once created so much alarm. There seems at first to have been considerable doubt whether there would be enough members to make a Congress at all, and not more than fourteen finally turned up. In order, however, that everything might be done in grand style, a President and four Secretaries were appointed—a very liberal proportion of officials for so small a number of members. A question was raised whether a Russian who had come of his own accord, and without authority from anybody, to represent his country should be received, but the Congress was so anxious to make up its numbers that it was only too glad to admit anybody. The Secretary of the Federal Bureau reported that, as nobody had written to him, he had had a very easy time of it, and had not been put to the trouble of answering any letters or to any expense for postage. The Belgian delegate stated that in his country the Association had not been idle. It had got tip excursion trains at Antwerp, which had made the International popular in that reactionary city; and at Brussels it had organized itself in a manner which had had the satisfactory result of making the *bourgeoisie* very uneasy. In the Vale of the Vesdre the members had hit upon an ingenious and happy way of showing defiance and contempt for the police, and this was by taking such good care to be peaceable and orderly that the police never had a chance of laying hold of any of them. The Swiss delegate drew attention to a serious obstacle in the progress of the movement in his country, which was that unfortunately there was not a sufficient antagonism there between rich and poor. Moreover, Swiss working-men had a tendency to become *bourgeois*, and it was of course not worth while to pull down one set of *bourgeois* if another set was immediately to spring up. However, he was disposed to take a sanguine view of the future, and to comfort himself with the anticipation that "the misery of the workpeople and the progress of industry would tend more and more to assimilate Switzerland to other countries." In the course of time, therefore, Switzerland might hope to be as miserable as bigger and more advanced countries. Another difficulty was that, though the Socialist propaganda held meetings, published papers, and issued tracts to enlighten the people, the *bourgeois* reformers were constantly thwarting these efforts by proposing palliatives. It must be admitted that it is very hard on the Internationalists that the *bourgeois* reformers should point out that any small holes in the kettle may be easily mended with a little solder, instead of breaking it up altogether and trying to make a new one. The German delegate gave rather a desponding account of affairs in Germany, but the French delegate was more cheerful. He announced that there were now more secret sections of the International in France than under the Empire, but of course he could not enter into particulars. In Italy the Internationalists are also disposed to keep out of view as much as possible, and they have even addressed a remonstrance to the Congress, pointing out the absurdity of "a vast publicly-organized conspiracy," and demanding a radical change of system. As long as the International goes about its work publicly its enemies will know what it is about, and will be able to frustrate its operations. Unfortunately, the necessity for absolute secrecy prevents the Italians from explaining their own modes of action, and they have to be content with the declaration that, "with a heart filled with an immense

"faith in the realization of our programme, we conspire for the complete destruction of the State, with all its malevolent institutions, the annihilation of every kind of authority, under whatever form it may present itself, and for taking possession by the uplifted masses of all the implements of labour, machines, and raw material, including the soil." Everything, it is added, is summed up in the two words "Anarchy and Collectivism," conditions which the Italians consider indispensable to the triumph of the social revolution which they have in view. Most people will agree with them as to the connexion between anarchy and these projects, and perhaps Collectivism might be seen to be equally necessary if one only knew what it meant. The Spanish brethren report that they are in great trouble, and that "vengeance is their war-cry." They are very anxious to have "the great social liquidation" hurried on as quickly as possible.

English working-men appear to have had the good sense to refrain from taking part in this ridiculous exhibition. However much some of them may sympathize with the comprehensive projects of anarchy and spoliation sketched out in the address from Italy, they are probably aware that more is likely to be obtained by the adroit use of one class of proprietors against another. The English Communists have hitherto derived their chief strength from the suicidal folly of industrial capitalists who are weak enough to imagine that they can gratify their social jealousy of landowners without in turn suffering from the principles of confiscation which they are helping to establish. There is nothing now in the ideas which it is the business of the International to propagate, but it would be a mistake to suppose that their folly prevents them from being formidable. The International is contemptible enough in itself, and there can be little doubt that its wisest course would have been to play the part of the veiled prophet. As long as it was a dark mysterious agency, the proportions and resources of which nobody could calculate exactly, it exercised a certain power; but when it presented itself for close inspection in the daylight at Congresses and the like, it was immediately seen how artificial and worthless the apparatus was which for a time had created so much alarm. This impression will be confirmed by the insane rant which has just been poured forth at Geneva. It is necessary, however, to distinguish between the International itself and the wild aspirations and hungry desires which lie behind it. A very small spark may produce terrible results in a certain kind of atmosphere or in the neighbourhood of inflammable materials.

PUBLIC PROSECUTORS.

THE expediency of appointing public prosecutors has been for many years generally admitted; but their character and functions seem to have been for the first time seriously considered by the Judicature Commission. The ancient and existing system of criminal justice has, like many other English institutions, worked better than might be expected; and it has been remarked that in Scotland, where public prosecutors have long been established, crime is not more effectually detected or punished than in England. If revenge is truly defined as wild justice, justice is essentially regulated revenge. The resentment of injured persons will, with or without a public prosecutor, in the great majority of cases set the law in motion. When there is no doubt as to the identity of the offender, the ordinary process of justice is generally sufficient, and the detection of unknown criminals is the business of the police, who have themselves been instituted to meet the more complicated wants of modern society. Fifty years ago there were only a few detective officers in London, and the country and borough police date from a much more recent period. It is difficult to understand how the detection or prevention of crime was managed in times when it is nevertheless known that justice found abundant victims. At present sufferers by theft or violence give information to the police, who prepare the case to be heard by justices in Petty Sessions, or by police magistrates in towns. In country districts, when the prosecutor declines to employ an attorney of his own, the magistrates' clerk who has taken the depositions for the most part conducts the prosecution at Sessions or Assizes. In ordinary cases the depositions on which the committal has been founded serve

for a brief; and the same witnesses who were heard before the magistrate prove the case in Court, having already satisfied the superfluous and inconvenient tribunal of the Grand Jury. When more complicated crimes are committed, and when large interests are involved, prosecutors sometimes incur heavy expense in preparing and conducting prosecutions. The costs of the Bank of England in the prosecutions for forgery two or three years ago were roughly estimated at 100,000*l.* The enormous expense of the prosecution of O'NEILL for perjury was borne by the State on the direction of the Chancellor of the Exchequer. In such cases the Solicitor for the Treasury acts as public prosecutor, and either the law officers or other counsel are employed at the discretion of the Treasury.

The majority of the members of the Commission propose only to extend the functions which have been almost accidentally assumed by the magistrates' clerks, who have of late years been generally attorneys. The clerks have for the most part considerable experience in the conduct of prosecutions; and they may be trusted to form a judgment whether the case against a prisoner is sufficient, if supported by the witnesses and uncontradicted, to ensure a conviction. Where the depositions fail to disclose legal proof of guilt, it is usual for the judge to inquire whether additional evidence is forthcoming, and in default of further proof to direct an acquittal. Practitioners in Criminal Courts would probably state that such cases are comparatively rare; and it is understood to be the duty of a magistrate to take care that the evidence on which he commits for trial is such as will sustain a conviction. In fact, not one prisoner in twenty who is sent before a jury is innocent of the crime with which he is charged. The only practical effect of the intermediate inquiry before the Grand Jury is to allow a certain proportion of criminals to escape. If the foreman understands his business, and exerts a proper influence over his colleagues, true bills are found as a matter of course, and no harm is done. In the rare cases in which a Bill is rightly ignored an acquittal would be certain, and it would be more satisfactory to all concerned. Originally Grand Juries were probably the best public prosecutors, and the custom of requiring evidence before they find a Bill is comparatively modern. The only reason for maintaining the institution is that it is agreeable to country gentlemen to bear an ostensible part in the administration of justice. The Grand Jury of Middlesex have repeatedly presented themselves as a nuisance, although their objection is perhaps founded rather on the inconvenience to themselves than on the impediment which they offer to public business. At the Assizes those who are summoned on the Grand Jury are not unwilling to visit the county town on a public occasion, and to receive official sanction for their claims to form a part of the local aristocracy. So far as they have attended to their duties as magistrates they are perhaps entitled to a formal recognition of their services, but it is absurd that, after committing prisoners on careful examination of the evidence, they should take part in an irregular and useless rehearing of the case.

The LORD CHIEF JUSTICE holds that prosecution is not a stage in criminal proceedings, but that it includes the entire process from the completion of a crime to the conviction of the offender. He accordingly proposes the appointment of a public prosecutor, assisted by a sufficient number of local functionaries, who is to be charged with the detection of crime, with the apprehension of the person suspected, and with the conduct of the case both before the magistrate and at the final trial. His only reason for dissociating the office of public prosecutor from that of Attorney-General is that the law officers are already overburdened with public business. It would indeed be impossible that the Attorney-General should undertake the direction of the police; and his superintendence of ordinary prosecutions could be only nominal. According to the plan of the LORD CHIEF JUSTICE, a barrister of standing and eminence would be appointed public prosecutor during good behaviour, and local public prosecutors with their requisite staff of clerks would be appointed or dismissed by their chief. It is an essential part of the scheme that every case should at the earliest moment be brought under the notice of the local prosecutor, who would consult in difficult matters the head of the department. The CHIEF JUSTICE thinks that in the majority of cases the public prosecutor would only find it necessary to interfere for the purposes of the trial; but he would at his discretion

superintend and direct the previous inquiries of the police. In every case it would be his duty to examine the depositions, and to take care that the proofs were complete before the case came into court. It would be his business to perform the functions which now devolve on the attorney for the prosecution; or, in Crown prosecutions, on the Solicitor to the Treasury or to other public departments. The public prosecutor would prepare the briefs and instruct counsel, and the LORD CHIEF JUSTICE thinks that there would be no difficulty in providing against the undue exercise of professional patronage. The power of stopping a prosecution at any stage would be transferred from the Attorney-General to the public prosecutor; but it would be competent to the Government to entrust the conduct of Government prosecutions to its own officers, and the Attorney-General would retain the power of filing *ex officio* informations.

If the proposal of the LORD CHIEF JUSTICE is adopted, there may perhaps at first be some risk of a conflict of authority between public prosecutors and Commissioners of Police or Chief Constables. It would not be desirable that the police should be placed directly under the control of any stranger to the force, but the superior officer of the district might without inconvenience be required to obey the directions of the public prosecutor, either in adopting particular methods of detection or in collecting evidence. The heads of the police would frequently profit by the opportunity of obtaining sound legal advice, and they might sometimes welcome relief from the responsibility which they are at present compelled to incur. The public prosecutors, as well as the police, would be subject to the authority of the Home Office, which would have the power to determine their mutual relations. The LORD CHIEF JUSTICE entertains a high opinion of the police, but he concurs in the general belief that their zeal for conviction sometimes leads them too far, and that they ought not to be trusted with the conduct of prosecutions beyond the preliminary stage. It is in fact much more difficult to prepare a case for committal than to prove it before a jury. The trial is merely a decent formality, except in the few cases in which an innocent person is unjustly accused. Great deference is due to the experience and knowledge of the LORD CHIEF JUSTICE; and it is to be regretted that criminals should sometimes escape because the evidence against them has not been prepared with sufficient care; but the main object of the appointment of public prosecutors would be to facilitate the detection of crime, and to prevent the impunity which arises from negligence, or sometimes from compromise. The expense of the necessary staff would not be grudged, if crime were more effectually detected and more certainly punished. It may be supposed that prosecutions directed and conducted by public officers would not be subjected to the vexatious supervision of Treasury clerks, who now sometimes display their power by refusing to sanction costs which are indispensable to the due administration of justice. The Judges have often censured the capricious parsimony of functionaries who ought to be auditors and not censors of judicial expenses.

WORKMEN'S TRAINS.

THE controversy as to the obligation of the Railway Companies in the matter of workmen's trains raises several questions of interest. In the first place, it has been put, alike by the Chairman of the South-Eastern Railway Company and by the London Trades' Council, on a wrong footing. Sir EDWARD WATKIN declares that these trains have been run "for reasons of philanthropy and not for profit." The decision of the Board, he says, was influenced in no small degree "by a sense of duty towards the poorer people of London, whose dwelling-places are a stigma upon the wealth and civilization of the metropolis." He seems further to hint that these sacrifices to philanthropy might have gone on for ever if the public had but been decently grateful to its benefactors. But this great railway interest "which has done more than any other interest for the benefit of the nation" is everlastingly abused, and in consequence of this the Companies may be expected to "adopt the new policy of looking after themselves." The London Trades' Council, on the other hand, treat the matter as one not of philanthropy, but of justice. They demand that a law should be passed making it compulsory upon the Railway Companies "to afford every facility for the transit of working men and

"women to and from their places of employment;" the words "every facility" being subsequently explained to mean "at the lowest possible fares." In a matter of this kind professions of philanthropy and claims of right are equally out of place. It is difficult to believe that the policy of looking after themselves will be really a new policy with any Railway Company. They may easily bring more intelligence to the process, but it may be doubted whether they can possibly bring more good will. Sir EDWARD WATKIN includes among the motives which originally determined the South-Eastern Directors to run workmen's trains the hope of finding them a commercial success, and, now that they have not been found a commercial success, he recommends the Directors to withdraw them. On the face of it, therefore, the philanthropy of the Company breaks down just where the pinch comes. So long as they hope to make workmen's trains pay, the Directors are animated by a sense of duty towards the poorer people of London. As soon as they discover that the trains do not pay, they suddenly become impressed with their duties towards their shareholders. If workmen's trains were to be a commercial success, where was the philanthropy? If they were to be run without regard to profit and loss, where was the Directors' consideration for their shareholders? The simple explanation probably is, that if the workmen's trains had brought in the money the Directors expected, they would have been glad to enjoy popularity and a consciousness of doing good into the bargain.

The claim of the London Trades' Council is founded on a misconception of what Railway Companies really are. It is not unnatural perhaps that careless persons, seeing the immense scale on which railway business is conducted, should come to fancy that they are in some sort State concerns. The London Trades' Council would not dream of asserting a right on behalf of working-men to be carried at the lowest possible fares by any carrier's cart which they might please to hail. They would at once admit that this would be an unjustifiable interference with individual property. The owner of the cart has a right to charge what he chooses for the benefit of riding in it, and if the workman cannot afford to pay the price demanded, he must either walk or find some other carrier who will convey him more cheaply. What the London Trades' Council do not see is that Railway Companies are nothing more than common carriers writ large, and that to compel them to carry working-men at less than a paying rate would be to impose a special tax upon the shareholders for the benefit of a particular class of passengers. It would be just as reasonable to ask each proprietor of a joint-stock bank to contribute a penny towards the cost of workmen's tickets as to ask railway proprietors to issue tickets at a penny when they really cost them twopenny. The Railway Companies are ready to run trains of any description at rates which bring them in sufficient profit. It is clear, therefore, that what the London Trades' Council really mean by the lowest possible fares is, not the lowest fares at which trains will pay, but such fares as will come within reach of the workman's pocket. If this is to be demanded of Railway Companies, why not of the owners of cabs and omnibuses? And if it is to be demanded of those who sell the means of conveyance, why not of those who sell other commodities? It would be no more unreasonable to "make it imperative" upon bakers or butchers to "afford every facility" for the feeding of working-men and working-women than to make it imperative upon Railway Companies to afford every facility "for their transit to and from their places of employment."

There are two respects, however, in which Railway Companies differ from other carriers, and it remains to inquire whether these differences ought to involve any difference of treatment on the part of the Legislature. In the first place, they are the holders of what in most places is a monopoly of the means of conveyance. If the South-Eastern Company, for example, refuses to run cheap trains between Greenwich and London, it is not at present open to others to do so, even if they are persuaded that it can be done at a profit. Parliament had a plain right in the first instance to make what terms it chose for the grant of this virtual monopoly, and, inasmuch as it has never pledged itself not to allow competing railways to be constructed, it has still a right to say to the South-Eastern Company, If you do not find it answer to run cheap trains between Greenwich and London, we will allow any Company which thinks that it can do more for the public in this way to construct a new railway alongside of yours. It is conceivable that, with the experience

which has been gained from observation of existing railways, and with the introduction of cheaper modes of working, it might be worth the while of a new Company to try the experiment, and so to drive the existing Company either to reduce its fares or to bear the loss of a great part of its traffic. It is not likely that any legislation of this kind is imminent, but Railway Directors may do well to anticipate the possible consequences of subjecting the public to needless irritation. The real way out of the difficulty is perhaps to be looked for in a general reduction of third-class fares. At present one objection urged against running workmen's trains is that people who are not workmen travel by them, and that in consequence of this the earnings by other trains are lessened. But this may mean that there is a large class of persons who would travel more frequently by rail if the fares were reduced. At all events Railway Companies will be wise to exhaust every possibility of improvement in this direction before they take off workmen's trains without enabling those who travel in them to share in a general lowering of passenger charges. The other distinction is that Railway Companies which have stations in the centre of London and other large towns have undoubtedly greatly contributed to overcrowding among the poor by pulling down great numbers of dwellings without any proper provision being made for the housing of their inmates. Parliament has now devised a mode of meeting such cases, and for the future no Railway Company will be allowed to evict poor tenants unless some arrangement can be made for providing them with as good dwellings as those of which they are to be dispossessed. A condition of this sort cannot be made retrospective, but the Companies who have not been subject to it may fairly be asked to consider whether, in running workmen's trains, they make any greater sacrifice than that which will henceforth be demanded of all Companies which desire to extend their accommodation, and would certainly be demanded of them if they had now to make their lines over again. If this is the case, and if in continuing to run workmen's trains they merely decline to avail themselves of an accidental advantage over younger Companies, they will do well to hesitate before they expose themselves and the interests they represent to the hostility of a class which feels more keenly than it reasons. The owners of a kind of property which uneducated men are apt to imagine to be in some unexplained way the property of the nation can hardly be well advised in making themselves unpopular for any trivial cause.

CENSORS.

WE doubt whether a habit of judging the conduct of others is compatible with self-study. There are respectable persons in every rank of society who seem to view themselves as the guardians of the lesser public morals—persons who may be defined as the voice of public opinion to all within their reach. They lay down the law with an unflinching regard to the simple right and wrong of every question; it is their vocation to keep up the rigour of decorum and the consistency of practice; they are unconsciously referred to as "the world" in every conflict between time-honoured custom or exact propriety and personal inclination and convenience; they live in a constant surprise at the laxity of other men's principles, and the loopholes through which other men escape the obligations imposed by a nicer conscience. Their whole tone, in short, represents stability and inflexibility; but nevertheless, when their own turn comes, they not only avail themselves of the same loopholes, but do it in utter unconsciousness that they are running counter to their own most strongly pronounced rules of action. It is not that they ride over scruples, but that they have none; they fail to see the analogy between their own case and the nearly parallel one on which they have recently passed an emphatic judgment. For point and emphasis, the gift of putting an opinion in an epigrammatic form easy to remember and adapted for quotation, is one much exercised by these mentors. Horace Walpole, writing to his friend George Montagu, on the death of his cousin Lady Bab, tempers his condolences with an anecdote. "I must make you smile. The second Miss Jefferies was to go to a ball yesterday at Hampton Court with Lady Sophia's daughters. The news came, and your aunt said the girl must not go to it. The poor child then cried in earnest. Lady Sophia went to intercede for her, and found her grandmother at backgammon, who would hear no entreaties. Lady Sophia represented that Miss Jefferies was but a second cousin, and could not have been acquainted. 'Oh! madam, if there is no such thing as tenderness left in the world—cinq ace—Sir, you are to throw.'" If this old lady had not had such very decided views about the social duties incumbent on the class of mourners in general, she might have asked herself some questions about the legitimacy of her own pleasures as one of that class. But

her position of arbiter, the shock to her sense of propriety in any public appearance under the circumstances, and the duty of protesting against other people's laxity, put such comparisons out of the range of possible speculation.

An insight into motives, and into the less obvious class of influences that determine conduct, is among the most marked differences between man and man. The people we speak of would be spoiled for their work if they set themselves to study the inner workings of mind. Action is their starting point; and it is clear that self is much further removed from one line of investigation than from the other. Men whose bent is to trace an action back to its source are driven, as it were, to self-study. They can know nothing of the subtle working of another mind but through their own. Those, on the other hand, who centre their scrutiny on the doings of their neighbours do not commonly trouble themselves with actuating causes. Thus they simply assume that motives must be as alien from their own finer tact or conscience as the action itself. The person who is in the habit of accounting to himself for the why and the wherefore of his course of feeling, motive, and performance can hardly fail to be indulgent in his judgments. All thought, questioning, deliberation upon the action of others, leads towards tenderness and sympathy. It is a frame of mind that may easily become morbid, investing even crime with fascination to certain imaginations, and, short of this, obscuring the strict boundary between right and wrong. But the people who judge by rule and line, by cut and dried social laws and prejudices, who never consult their inner self for extenuating circumstances, are certain to err in the opposite direction. No man can fairly judge his fellow, either in great matters or in small, without sympathy—an undreamt of superfluity to the self-elected censor. In the absence of this moderator the very strength of opinion on a question of duty or propriety must, to people of this turn, ensure performance and obedience to it in their own case as a matter beyond self-inquiry. In short, a strict rule for others passes with many for conscientiousness; it seems so impossible to steady respectability not to act as it preaches; especially it is not in ordinary human nature to suspect itself of failure at the very point where it is keenest-sighted, and where its judgment is most vigorously exercised. There is a self-evident absurdity in acting against our principles, in having one rule for others and another for ourselves. We understand inconsistency well enough in the case of other people and the world in general, but the contradiction is too violent an insult to self-love to be regarded as possible in our own person. And, in fact, however the code may seem to be outraged to the observer, we do not find it strikes the censor as an inconsistency.

Nor is it so difficult as at first appears to provide a satisfactory solution for an apparent hitch between principle and practice. It is only to give to self alone the benefit of exceptions. It may be observed that exceptions are always personal things. Other people's illnesses, for example, follow a prescribed course; but when it comes to our turn, our malady accommodates itself to no category, and resists all nomenclature. And so of regimen and of every branch of practice that is a law to the generality. What we are ready to enforce on the mass happens, for some reason or other, not to fit our own idiosyncrasy; for it is so common for people to think their own case peculiar, and subject to no general law, that scarcely anybody is wholly free from the illusion. The most furious zealots will make exceptions for those on whom their affections centre. The world must accept a certain formula or be consigned to hopeless perdition; but an escape is found for a recusant brother, lover, husband, or wife. Something quite singular is found in the favoured case. No precept is unbending enough to escape such handling. The Nubian Arabs, who are strict Mahometans in a country prolific of pig, will eat wild boar, though in express prohibition to the rules of the Koran. "But what would your Fakir (a countryman, no doubt) say if he was aware of such a transgression?" "Oh, we have already asked permission," was the reply; "and he says, If you have the Koran in hand and no pig, you are forbidden to eat pork; but if you have the pig in your hand and no Koran, you had better eat what God has provided you." Thus it is possible to abhor eaters of pork and at the same time to eat it. A similar case is presented by David Deans, that model censor, upon the occasion of Reuben Butler's being presented by the Duke of Argyll to the living of Knocktarlicie. "Honest David," it is observed, "had now, like other great men, to go to work to reconcile his speculative principles with existing circumstances, and, like other great men, when they set seriously about that task, he was tolerably successful." The course of reasoning by which he succeeded in eating the words of a lifetime is very ably and humorously set forth. So far from any qualm visiting the good man on the surprising conclusions arrived at, or any humbling sense of inconsistency, we are told that the messenger whom he despatched to his son-in-law elect added to his summons "that certainly the gudeman of St. Leonards had some grand news to tell him, for he was as uplifted as a midden cock upon pattens." The censorial temper is not auspicious; strong in its moral insight, it owns no vulnerable side. What satisfies its clear notions of right must needs satisfy the world. We are very sure that no shamefaced consciousness would withhold old David from continuing to denounce in his usual strain those "ulcers and imposthumes, the sores and leprosy of his time," from which by a chain of subtle distinctions he had so barely kept aloof.

There must be censors, but the office is certainly one of those which, if good for mankind, are yet perilous to the holders.

We have David Deanses in our own time, who are very apt to call the attention of the public to a man's private transactions, and to express their opinion of other people's line of conduct with a length and elaboration which circumstances did not seem to call for. We never see a parson called to account in a newspaper for being at a ball, or a bishop for dining out in Lent, without a pretty strong conviction, justified by instances to the point, that the dictators of these reproofs will be "doing the same" before long, only under exceptional circumstances. The grandee of the county gives a ball. The censor is invited—"not of course to the dance—the whole house is thrown open." Our serious friend is there, but assures us that he scarcely comes within sound of the fiddles. The ascetic whose zeal drove him into print refuses a dozen dull invitations, and in each case gives his reasons; but there comes one attended by such peculiar circumstances that rules ought to give way. Some host whose civilities have been rewarded with three pages of austere counsel meets him without being aware of the special points which make it right to be at the distinguished gathering, though wrong to sit down at his own less brilliant or fashionable board, and he reports the encounter; not, however, to the confusion of his critic, who is strong in the monopoly of exceptions. It does not occur to him that the bishop may have been acting under peculiar circumstances also. However, we are describing censors, not judging them.

Society, and especially the more domestic forms of social life, may be said to be governed by female censors, self-constituted exacter of observances and definers of the proprieties of life. They settle times and seasons; they are authorities upon ceremonies; they have fixed opinions on the breadth of crape and how long it should be worn. Tenderness and feeling are with them identified with their outward tokens, things to be weighed and measured. And they follow strictly their own rules, and are conspicuous examples so long as no exceptional circumstances arise. It is impossible for a woman of due sensibility not to stand in awe of these arbiters, not to regulate her conduct with some reference to their dictum. Absolute defiant self-reliance is no part of social discretion. Only, if she has a rigidly faithful friend who lives in her mind as a subsidiary conscience in minor proprieties—"What will Priscilla say?" interposing itself in every conflict between prescription and inclination—and if it ever occurs to her friend to be tested where she is most officious in advising, it is ten to one but she will witness some broad modification; some difference between preaching and practice which takes her by surprise. But it does not startle Priscilla, who is too unconscious of inconsistency to apologize, and perhaps preaching one way and practising another simultaneously. The habit of laying down the law and judging our neighbour is not to be checked by a mere rule of conduct. It is so natural to do what is pleasantest that people out of the way of self-scrutiny slip into it unconsciously as into an attitude of bodily repose.

This practice of self-study is not necessarily allied to greatness of mind; with some noted examples of it it is more a faculty or a taste than a virtue or a grace, but it always promotes candour and fair judging. Pepys, a fair, though by no means a great man—a man however held in high respect by Evelyn, himself a censor in the best sense of the word—wrote his Diary at a time when society was extraordinarily corrupt, when public men were venal beyond example, and the Court a byword for all time. He was in the way of seeing and hearing a great deal both of public men and the Court, and writes about them with perfect truth; but he writes with equal fidelity about himself; his motives are as naturally recorded as his actions; therefore he is never censorious. It seems as if he knew himself too well for the luxury of abuse. If he reflects at one time on the short-lived grief of widows, he falls back at once on his experience for an explanation. "Sent for by my Lady Batten. I to her, and there she found fault with me for not seeing her since her being a widow, which I excused as well as I could. And here do see what creatures widows are in weeping for their husbands and then presently leaving off; but I cannot wonder at it, the cares of the world take place of all other passions." And he knows this, and excuses it because he himself reflects on the death of a friend, and the causes which modified his own grief. "Which I do sorrow for as much as I can, for a death that brings me a hundred a year." He can write with moderation of the alleged cowardice of our naval officers, because he knows what a panic is in his own person. "On foot to Greenwich, where going I was set upon by a great dog, who got hold of my garters, and might have done me hurt; but, Lord! to see in what a maze I was, that having a sword about me I never thought of it, or had the heart to use it." He was the great man of his family, and took upon him on one occasion to blow up a poor relation; the man returned him, word for word, all his own terms of slight and disrespect. "Which argues," he remarks, "a high and noble spirit in him, though it troubles me a little that he should make no more of my anger; yet I cannot blame him for doing so, he being the elder brother's son, and not depending on me at all." No man ever took a more candid view of himself—surveying his inner self, as it were, from some external standpoint; and no man was ever more dispassionately fair and indulgent in the sense that what others did was intelligible to him. Yet he was fairly honest among rogues, and a faithful servant to his king, his chief, and his country, when the majority about him were every man for himself. In this particular quality he stands unrivalled. There are, we believe, more

"great and good men" than there are men of this unsparing self-knowledge and unflinching self-portraiture.

The office of censor is noble or trivial, those who fill it betray a lofty or a petty spirit, according to motives and objects. Zeal, a passion for virtue, a hatred of vice and wrong, urges the heroic censor to his task, beyond all thought of self, whether flattering or humiliating. A milder, but not less genuine, zeal for the right compels the social critic often unwillingly to his or her calling. The petty censor is prompted primarily by some personal motive. Some vanity of a special insight, some notion of privilege or self-importance, some suspicion of slight, some solicitude for display, or perhaps the mere spirit of meddling, lies at the bottom of the censorship, and prompts to officious expression; and self, being so far busy, is not to be put down when interest or convenience demands a remission of strict rule. The censor unsays his precepts, and society is justified in turning tables on its critic.

MR. DAWKINS ON THE BASQUES.

IN the present number of the *Fortnightly Review* Mr. Dawkins has put into a systematic shape the result of the latest observations on an important question with regard to the ethnology of Britain and of Europe. This is the question with regard to the past and present extent of that non-Aryan race in Western Europe which is now represented by the Basques. No one doubts that that race had, even in historical times, a much wider extent than it has now. No one doubts, for instance, that the Basques are the remnant of a race which once occupied a much wider range in Spain and Southern Gaul, and most likely there are not many who doubt that they represent the oldest surviving inhabitants of those countries. Few will now be inclined to hold with Niebuhr that the Celts were in Spain before the Iberians, and that the Iberians appeared in the peninsula as intruders upon the Celts. It seems now to be generally acknowledged that the Basques on both sides of the Pyrenees are the remnant of the old Iberians on both sides of the Pyrenees, that these Iberians or Basques are the remnant of the earliest non-Aryan inhabitants of Western Europe within historic times, and that it was upon them that the Celts came as the vanguard of the Aryan migration. And when thus much is accepted as something very like certain history, we are ready to accept a good deal more as having a very high degree of probability. We are quite prepared to see in the Basques the remnant of a people who, even in historic times, may be traced far beyond the bounds of Spain and Gaul, and who in prehistoric times may very well have been spread much further still. We are quite prepared to accept, on a very small amount of evidence, the Ligurians of Gaul and Italy, the Sikanians of Sicily, and even the native tribes of Northern Africa, those who were there before Phœnician and Roman conquests, as belonging to the same race as the Iberians of Spain and Aquitaine. And, if we admit Ligurians and Sikanians as branches of this once wide-spread race, we as good as admit that the whole of Italy was once occupied by an Iberian people, and that, ages before the Scipios carried the Roman arms into Spain, the primitive Latin, the forefather of the Roman, had to dislodge the kinsmen of the Spanish Iberian from the seven hills themselves. To such a belief there is no kind of *a priori* objection; the doctrine falls in with all that we know of the general relations of the Aryan and non-Aryan races, and it further falls in with not a few strange and isolated, and therefore the more trustworthy, Italian traditions. Nay, we are prepared to go further and to believe that, besides these regions where this ancient race may be tracked by something like history or tradition, modern science may track them in wide regions where they have left no such historical or traditional traces. Many scholars have been led by a quite independent line of argument to believe that the British islands, before the coming of any branch of the Celtic race, were inhabited by a non-Aryan people, to whom some classes at least of megalithic structures are to be assigned. The only question would be whether these non-Aryan inhabitants of Britain were Basques or Pins, and if, as some say, Basques and Pins are really the same, this is no longer a question at all. To all this there is no kind of objection; it is just what we should look for *a priori*, and a very small amount of positive proof would be enough to make us believe it. But it is going a step further when we are told, not only that there once were Basques or other non-Aryan inhabitants of the British islands, but that a certain, and not very inconsiderable, Basque element remains in the inhabitants of the British islands still. This doctrine is not altogether new; there is something like it in Tacitus, and it has been strongly set forth by Professor Huxley. Here it is again put forth as part of an elaborate system by Mr. Dawkins. Now the arguments both of Mr. Huxley and Mr. Dawkins naturally turn mainly on physical phenomena, as the form of skulls, and on the evidence furnished by implements and the like. This is one side of the case, and we do not at all undertake to answer the various arguments on behalf of his view which Mr. Dawkins has put together in a very clear and orderly shape. What we wish to do is to put on record some arguments from another side which it seems to us that Mr. Dawkins has forgotten or undervalued.

Mr. Dawkins, almost at the beginning of his essay, speaks thus:—

The study of language has proved itself a broken reed to lean upon, since a language may pass away without a corresponding change of race. The English-speaking Cornishman, for example, is the descendant of the

Welsh-speaking dweller in West Wales, and has lost his mother-tongue without changing his physique; and English at the present time is slowly but surely supplanting Welsh throughout Wales, without any corresponding alteration in the people. It is obvious, therefore, that language is a very uncertain guide to race.

Now if anybody were to set up language as the one unerring guide to race, we should at once be plunged into the wildest confusions and contradictions of the plainest facts of history. But it does not therefore follow that language is to be cast aside as something which need not be taken at all into consideration in forming our judgment on such questions as those which are here started by Mr. Dawkins. It is quite certain that many nations have changed their language without any change in themselves—that is, they have adopted the language of some other nation. The example of Cornwall which Mr. Dawkins has chosen is as good a one as could be found. Though the saying about Tre, Pol, and Pen is all nonsense—though, as every one who has looked in Domesday must know, the forefather of any particular Tre, Pol, or Pen is as likely to have been English or Norman as British—yet there can be no doubt that the great mass of the inhabitants of Cornwall are of British descent. Nevertheless no tongue is now spoken in Cornwall but English. In the like manner various other tongues, among which Greek, Latin, German, Spanish, Arabic, and Persian are conspicuous, are, or have been, spoken by large masses of people who certainly were not Greek, Latin, or so forth by descent. Still, for a people to change their language is by no means an easy business. And, though it has often happened in the history of the world, yet every case in which it has happened is in some sort an exceptional case. That is to say, when a nation has changed its language, we shall commonly see some special reason why that particular nation should change it. When a nation changes its language, it commonly does so because it has been conquered or otherwise strongly influenced by some nation which has a marked superiority over itself. Mere conquest is not enough. A conquest is not likely greatly to affect the language of the conquered, unless the conquerors settle to a considerable extent in the conquered country. And something more is needed besides mere conquest and mere settlement. When the conqueror is also the civilizer, he can commonly carry his language with him. If he is not the civilizer, if he overcomes a people more civilized than himself, experience shows that he is not likely to impose his language upon the conquered, but is more likely to exchange his own language for theirs. In a large part of Asia, where the inhabitants had no special civilization of their own but were ready to accept the Greeks as their masters in everything, Greek easily displaced the language of the countries, and became, as in some parts it still remains, the one spoken language. In the further East the case was different; there there were ancient national systems, which we may look upon as very inferior to that of Greece, but which still had quite life and strength enough to bear up against Greek influences. All that the Macedonian Kings of Syria and Egypt could do was to plant Greek colonies in their kingdoms; they were not able to make Greek supplant the native languages throughout the whole country. So in the West, Latin spread itself everywhere, because there the Romans were teachers as well as conquerors. But it utterly failed to supplant either Greek or the languages older than Greek in the lands east of the Adriatic. So again, when the Teutonic conquerors settled within the Roman dominions, wherever they simply settled among the Roman inhabitants and did not displace them, instead of carrying their language with them, they adopted the language of the conquered. It was only in the lands where the Roman inhabitants were really displaced—in Britain and in the lands along the Rhine and the Danube—that the Teutonic conquerors kept their Teutonic language. In all these cases we can see why certain nations changed their language, while certain others do not. The more civilized language will displace the less civilized, even in the teeth of a great superiority of numbers. But nothing short of a superiority of numbers on the part of the conquerors which comes very near to an extermination of the conquered can make the more civilized language give way to the less.

The same line of argument may be followed out with the progress of the English language in the Celtic parts of the British islands, with that of German among Wends and Prussians, with that of Spanish in vast regions of America. Wherever a people change their language for another, we can see a definite reason for their changing it. And when a nation does altogether change its language, nay when a nation is wholly swept away, its language does not at all necessarily vanish without leaving traces of itself. In many parts of the world, extinct languages, languages of which not a word is now spoken within their ancient bounds, have left their mark in the names of great natural objects, and, where there are any, of great cities. A crowd of examples press upon us from the English-speaking lands on both sides of the ocean; our Pens and our Lydiards, Connecticut and Massachusetts, London on the Thames and Gloucester on the Severn, are witnesses that there was a time when tongues other than English were spoken both in Old England and in New. So we may set it down as an almost certain rule that, however little of any other kind a nation may leave behind it, it will always leave some signs of its presence in local nomenclature. The presence of the Basques themselves may be traced far beyond the bounds to which their present range is confined. Languages, like men, may be banished; like men, they may suffer death; but, like men also, they commonly leave at least their monuments behind them.

Now what we are asked to believe on the subject of the Basques is this. History tells us that, before English or Roman invasions, Britain was inhabited by Celtic races. In a not inconsiderable part of the island Celtic races still remain speaking their ancient languages, and we know further that, in comparatively late times, those languages were spoken over a much larger part of Britain than they are now. We could tell further, without any other kind of evidence, by the aid of nomenclature only, that the Celtic languages—or, if the Celtic languages had utterly perished, that some language other than English and Latin—had once been spoken over all Britain. Why these changes should take place, why the Celts should in one part of the island vanish before the English, why in another part they should exchange their language for the English, are all facts which can be explained in the simplest way; they all follow the universal law of such cases. But now we are not only asked to believe, what we are perfectly ready to believe, that Britain was occupied by Basques before the Celts came into it—not only that a small infusion of Basque blood may have found its way into the veins of the Celtic conquerors, just as a small infusion of Celtic blood found its way into the veins of the English conquerors—but we are further asked to believe that in a not very small district of the island the prevailing blood is as truly Basque as in other parts it is Celtic and Teutonic. When we are asked to believe this, we cannot help at least pointing out that the change which is supposed is one which is quite without a parallel in the history of our own country, perhaps in the history of any other country. We can see why the Celts in Britain should change their own language either for Latin or for English; we cannot see why the Basques in Britain should change their language for Celtic. Yet, if it be true that there still is in Wales a Basque population showing marked Basque physical features, it is plain that they must have exchanged their language for Celtic ages before the authentic history of our island begins. Now it is plain enough why Iberians in Spain and Gaul should have forsaken their own language for the language of their Roman conquerors; but we can see no reason why Iberians in Britain should have exchanged their language for the language of their Celtic conquerors. The Celts may have been, or they may not have been, slightly in advance of the Iberians in some of the needful arts; but it cannot be thought that the Celts came amongst the Iberians as civilizers in the same way in which the Romans appeared as civilizers. The Celtic tongue cannot have been set before the Basques, as the Latin and the English tongues have at different times been set before the Celts, as the tongue of a people in every way greater and stronger and more civilized and altogether out of comparison with themselves. Yet the supposed Basque population in Britain now speaks, and from the beginning of history it has spoken, not Basque but Welsh, except so far as it may have further exchanged Welsh for English. No one has shown that there is even an infusion of Basque in the Welsh language; no one has shown that there is any trace of Basque nomenclature in any district of Britain. A Celtic settlement in such an age among a Basque people must have led to the extermination or expulsion of the Basque inhabitants; that they should have turned into Celts, without leaving any trace in the language or even in the nomenclature of the country, is a thing which in our point of view seems altogether unparalleled.

We thankfully accept Mr. Dawkins's physical facts as stating one side of the subject; we accept them as most valuable materials towards the discussion of the question; but we cannot look on the question as wholly settled till evidence of another kind has been weighed against them. We do not at all wish to make language the only guide in such matters; but we cannot admit that the evidence of language is to be cast away as if it had nothing to do with the matter. Mr. Dawkins's theory has in its own point of view strong arguments in its favour, but he should not forget that, from another point of view, there are difficulties no less strong in its way.

SOHO SQUARE.

IT is just a hundred years since the fortunes of Mrs. Theresa Cornelys began to decline, and with them the glories of Soho Square. Who remembers her now? Yet she was once a central figure in the fashionable world of London. Her house, now a pickle shop, was crowded with princes, nobles, and fine ladies. Her ball-room, now a Romanist chapel, was the headquarters of extravagance and gorgeous apparel. It was at one of her masquerades that the beautiful daughter of a peer wore the costume of an Indian princess, three black girls bearing her train, a canopy held over her head by two negro boys, and her dress covered with jewels worth a hundred thousand pounds. It was at another that Adam, in flesh-coloured tights and an apron of fig-leaves, was to be seen in company with the Duchess of Bolton as Diana. Death, in a white shroud, bearing his own coffin and epitaph, Lady Augusta Stuart as a Vestal, the Duke of Gloucester, in an old English habit with a star on his cloak, and the Duke of Devonshire, "who was very fine, but in no particular character"—all these, and others, passed through her rooms; yet before many years had gone by she was selling asses' milk at Knightsbridge, and in 1797 she died in the Fleet Prison, forming schemes to the very last for retrieving her broken fortunes. Attempts were unsuccessfully made to keep up the festivities of Carlisle House, but Abneck's drew away the great, and the Square gradually declined in the world, from fashion to philosophy, from artists to tradesmen, from shops to hospitals, until at length its lowest depth seems

to have been reached, and the beautifier of Leicester Square has been summoned to the assistance of Soho.

The ruthless hand of historical truth has of late years demolished many pretty stories, and has not spared the favourite legend of Soho. In the happy days when we believed in the immaculate purity of Anne Boleyn, when we derived Charing Cross from the *chère reine*, when we attributed the razing of Fotheringay to the filial piety of King James, and had a childlike faith generally in the honour and virtue of crowned heads, there were many tales to be repeated as constantly appropriate to certain localities, and always "as true as you're standing there." Among them, and involving a singular perversion of facts, is the popular account of the name of this district. "Soho" was the Duke of Monmouth's watchword at Sedgemoor, and was applied by his party to the Square in which his town-house stood. So ran the tale. There is a sediment of truth in it. The Duke did live in a house on the south side of what was then called King's Square, and his memory was long cherished in that district and elsewhere. But the district was then called, as it is called still, "Soho," and King's Square was then, as it is still, in "Soho." Monmouth's watchword was derived from the name of the place where his house stood, not exactly from the name of the Square; for it was then called generally King's Square, or else Soho Fields, and this name had been known, as Lord Macaulay points out, at least a year before Sedgemoor, and, as he might have pointed out, at least fifty years before that again. Where the name came from is a different question. It is easy to form conjectures about it, and to say it is derived from the footpad's slang of the sixteenth century, that the fields were lonely at night, and that divers persons were robbed in them, and so forth. In reality, however, we do not know much about the matter, and had better let it alone; while for those who like associations of the kind, it will be enough to point out that Monmouth's house stood where there is now a hospital for women, and that the narrow alley called Bateman's Buildings is on a part of the site.

There is still an old-world air about the place. If you dive down into the streets and lanes you see everywhere evidences of the greatness of former occupants. If a street door is open there is a vision of carved oak panelling, of fretted ceilings, of frescoed walls, of inland floors. Squalid as are some of the tenements, their inhabitants do not need to dream that they dwell in marble halls. Once on a time even Seven Dials was fashionable, and is not a little buried in St. Anne's? for one Wright, an oilman in Compton Street, had the body of Theodore of Corsica interred at his expense, and Horace Walpole pointed the moral of the poor Fleet prisoner's tale in his well-known epitaph. Here and there, at the corners, a little bit of the quaint style now in vogue as Queen Anne's allures the unwary passenger into a noisome alley, and Soho can boast of fully as many smells as Cologne. The paradoxes in which facts and statistics are so often connected may receive another example from this densely populated and still more densely perfumed region, for it has been found that children survive the struggles of infancy better in Soho than in many a high and airy country parish. Paintings by Sir James Thornhill and Angelica Kauffman are to be seen in some of the houses. Modern cast-iron railings may stand abashed before the finely-wrought work which encloses some of the filthiest areas. There are mantelpieces in marble, heavy with Corinthian columns, and elaborate entablatures in many an upper chamber let at so much a week. Visitors to the House of Mercy at the corner of Greek Street have an uncovenanted reward for their charity in seeing how the great Alderman Beckford was lodged when he did not make the speech now inscribed on his monument in Guildhall. Art still reigns in the house opposite, where the Royal Academy held its infant meetings, and it was close by, at the corner of Compton Street, that Johnson and Boswell, Reynolds and Burke, kept their literary evenings, and were derided by Goldsmith. The more purely scientific associations of the place are almost equally remarkable. On the south side of the Square, in the corner near Frith Street, Sir Joseph Banks and Mr. Payne Knight successively flourished, and the Linnean Society had here its head-quarters before it was promoted to Burlington House. Since the whole of Soho was more or less fashionable, it is nothing remarkable to find Evelyn and Burnet and Dryden residing within its bounds; but there is some interest in the lying in state there of Sir Cloudesley Shovel, when his body, recovered from the sea at Scilly, was on its way to Westminster Abbey. No doubt an effigy surmounted the pall, and the illustrious foundling appeared in the Roman armour and the full-bottomed wig in which he reposes upon his monument. Half the sites of curious scenes in Soho, half the residences of historical characters, have, however, been left without identification. When the Society of Arts began some years ago to follow the French example, and to place little tablets on the houses in which great men lived or died, they did well; but of late, for some years, they have slackened their efforts, and the whole district deserves, and still needs, the signs of their activity. If they are not disposed to carry on the task, they should formally give it up. There is much room here for something of the kind, and if it be true that Mr. Albert Grant proposes to assist Soho Square, he cannot have a better field for his operations. Here and there among the narrow streets and the crowded passages a shield of arms attached to the front of a house marks the residence of a great noble, or the name at a corner suggests the scene of some great event; but for the most part the labyrinth is unexplored, and the sites are forgotten or altogether unknown.

Almost simultaneously we hear of two projected improvements in neighbouring places. The Duke of Northumberland is prepared, it is said, to do something for Trafalgar Square, and the inhabitants have been stirring themselves up for the rescue of Soho. What the former noble space requires is not a garden. The smooth concrete which surrounds the Nelson column should not be disturbed. The lions of Landseer will look no better for being embowered in evergreens. The fountains will still be squirts, and their spray will still bespatter the passenger. What Trafalgar Square wants is a worthy building at its head. Until this is obtained the genius of a Knowles would be wasted on the place, and the riches of a Grant lavished delusively. A National Gallery, worthy of the nation, should rear a mighty front behind the fountains and the pillar. If money is to be spent it should be spent here, and perhaps, if a large sum were offered from some private purse, a still larger sum to meet it might be extracted without grumbling from the revenue of the country. The Ecclesiastical Commissioners find it very easy to encourage private benefactions by grants from the common funds, and no doubt something of the kind might be done, even on a larger scale, in the case of such national sites. Many of our art collections, now rendered almost inaccessible by their removal to the remote suburb of Brompton, might be placed here in the very centre of London. We can never boast of our National Gallery while we have no place for drawings, or for prints, except in portfolios at the British Museum, and while we are absolutely without any sculpture gallery, except the saloons where art and archaeology are commingled.

But our present concern is with Soho Square, and we cannot but feel it to be a hopeful sign that this movement has been set on foot. It is a sin to shut up the only clear space in a district so thickly inhabited. How many a child born and brought up in the adjoining streets has no ideas of trees or grass beyond what may be seen in that miserable quadrangle, and no ideas of art beyond the tottering statue of King Charles. An objection has been made that to beautify the Square will draw to it all the wretched inhabitants of the Seven Dials; but if this were a valid objection, which it is not, Seven Dials is no nearer to Soho Square than to Leicester Square, and there we have no complaints. That a place so consecrated to the memories of art as the residence of Lawrence and Wedgwood, of Bach and Abel, of Thornhill and the nascent Academy, should be shorn of the fountain which once embellished its garden, and should be suffered to fall into neglect and decay, is, to say the least, sad; but when there is added to those considerations the further one that among the vast populous regions of this populous city there is none in which a little breathing space is more required for the aged and the young, none in which pale faces more abound, none in which the rays of sunlight more seldom penetrate, it becomes not a sentiment only, but almost a Christian duty, to make some alteration, to let in a sight of the blue sky, and to answer to the changes of the seasons in the world without by a few bright flowers, a few green trees, a little grass, and a splashing of water. Whatever the motives with which such a work may be undertaken, its effects will benefit the masses. The civilizing influence of a little display of taste has been insisted on all the subject is threadbare. But the theory has not often been put into practice. Where anything of the kind has been done the success has been invariable. Poor as Soho appears now, it has claims on the rich. The historical claim is not worth much, as times go. Fortunately there is another. There is hardly a branch of industry which finds a place in London unrepresented here; there is hardly a source of wealth and profit without its example among these busy manufactories; and, on the other hand, there is hardly a form of vice, of squalor, of disease, which does not here take root and grow with far-reaching luxuriance. Any change almost would be an improvement. It is touching to see wan-faced children creeping forlorn round the dingy railings, trying to imagine from those few blades what a green field must be like; or to see feeble invalids carried across from the hospital to sit for awhile in that desolate enclosure.

A few trees and shrubs remain, and should be preserved. The space to be operated upon is not extensive; it must be tenderly dealt with. The statue once stood in the centre of a group with a fountain about its feet. This might well be revived. It would be a pity to take away all memorial of the King whose name was originally given to the Square, and obliterate all traces of the reign of Monmouth's estimable parent.

NORWAY.

AMONG the countries of Europe which are visited by Englishmen one would expect Norway to hold a prominent place. Excepting France, Belgium, Holland, and Germany, no country is so near our shores. Moreover Norway possesses nearly all that warms the heart and delights the eye of the traveller. Mountain ranges with summits above eight thousand feet high; fields of snow and glaciers; lower hills, now covered with the brightest of pasturage or endless wood, now craggy and precipitous; magnificent water everywhere, forming floods, lakes, torrents, and cascades; and an Arctic climate which itself ought to be sufficient attraction—these are some of the natural beauties which Norway offers us. And travelling has also little of the monotony which besets it elsewhere. The obsequious white-chokered waiters, and porters magnificent in cap of office and gold chain, come not here. The railway has not yet obliged us to catch the best views in a second of

time, and to change one climate for another before the former was well understood. Yet travelling is neither savage nor difficult for all that. Indeed it has a peculiar charm which is sought in vain in countries of thicker population and plainer surface. Notwithstanding all these recommendations, Norway is not yet a country that one intending tourist out of a hundred ever dreams of. There is indeed a certain select company of salmon-fishers who know Norway well, or at least as much of it as lies near the scenes of their favourite sport, and who live there in rough wooden country-houses on the streams which they hold. But these fishermen are not very numerous. Three of the fortnightly steamers from Hull to Thronthjem, and probably as many to Bergen, suffice to transport them to their Northern home. They are to be found on board Wilson's steamers as regularly as midsummer comes round; and there are among them men who have performed the process every year of the last twenty-one. But these fishermen are a small body, who will never set English society on fire with a desire to see Norway, and in Norway they soon retire to the recesses of their rivers, somewhere far up the country, and are rarely met by travellers on the high roads.

It is true that in Norway, as elsewhere, the chief foreigners who travel are English and American. In the more frequented parts near the capital it may be difficult to escape from the sound of one's native speech. But even in the finest scenery on the western coast and the fjords and valleys there, where travellers in search of the beautiful ought, if anywhere, to be found, it is quite possible to travel ten days or more without seeing either brother or cousin, although the time be spent in so accessible a district as the Sognefjord. It may therefore be useful to some readers (although those who diligently seek for information will find a small library of books about Norway, of very various excellence) to note the leading features of Norwegian scenery and the habits and habitations of the people.

It may be assumed that Norway will be visited in the summer. No one would willingly visit a country stretching so far into the Arctic zone in a season when nothing is to be seen through lack of light. The traveller therefore enjoys a brilliancy of light, a length of day, and an amount of heat far beyond what he was at all prepared for. How many people have expected to need furs and heavy clothing in the Arctic regions, where they really find the intensest heat, because the sun never sets and allows the earth and air to cool down! This climate would of itself be sufficient reward for the troubles of the voyage. There is perhaps no influence so subtle, yet so constraining, as that of climate, sun, and air. And the sensation of the Arctic double day, light perpetual, is something quite new and extraordinary, exciting yet invigorating. It enables one to go to bed at one o'clock and rise again at five, without the least feeling of lassitude. Only very little sleep is required where the life-giving rays never desert us. An approximation to this higher animation may be felt in the Shetlands, where the children may be seen playing on the hillside and in daylight till eleven, and people turn in to bed very late and reluctantly. Yet the extreme north of the Shetlands is only as far north as Bergen, at which place the Arctic voyager feels already, and with intense regret, that the long days have left him, that the nights of the less favoured Southern countries are beginning, and that gas in the streets and candles in the house are not cast-off absurdities. Indeed, as to latitude, Norway may be almost said to begin where Great Britain ends. Christiansand, the extreme southern point of Norway, is in lat. 58°, on the same parallel with the south of Sutherlandshire, about Dunrobin Castle and Lairgs. Thence Norway extends northwards for more than thirteen degrees to beyond 71°, or 44° beyond the Arctic circle. The entrance into the Arctic region makes a far more sudden and violent change in the summer climate than might have been expected. No experience of the long days in the north of Scotland, or even at Thronthjem (63½°), gives any adequate forecast of the true Arctic night. Near the Arctic circle you may, for about a fortnight at midsummer, see the sun descend below the horizon at ten minutes to twelve, leaving a subdued light, as if he were behind a cloud, and rise again at ten minutes past nearly at the same spot, which of course is north, with enhanced splendour. For the few minutes of the sun's absence a night-chill is perceptible, which is dispelled directly by his rising rays; but so far we have not yet reached the Arctic summer. The next night, if you have been voyaging on meanwhile, you must be a degree or so within the circle, and if the weather is fine and the northern horizon free from high land, you may carefully watch the golden orb (not generally so red as with us) descend towards the horizon, but, when about three times his own diameter from the horizon, after a few minutes of apparent standstill, begin to rise again, moving towards the east. The heat and brilliancy of the sun this night are such that parnolds are generally used, till the interest of the few minutes of crisis causes them to be discarded, and that if there be not too much wind, holes may be made in woollen clothes, pipes lighted, &c., by ordinary burning glasses; the sun may be gazed on, though with some pain, by the naked eye. The further north you go the higher is the sun's lowest point, till at Tromsø (69° 40') he is five or six times his diameter above the horizon, and the longer is the period during which he never sets, which is a full month at Hammerfest (70° 40'). The amount of light of course diminishes during the evening, but after half-past ten remains the same, and appears towards midnight rather to increase. It has greater softness than the light of day, and sheds a peculiar warm glow over the sea and rocks, which must be seen to be thoroughly

understood. After midnight it is interesting to watch the evening light change its character; about half-past twelve or rather later it assumes a whiter colour, more like what we know as early morning light an hour after sunrise. The birds fly about, the fishes jump, and animated nature seems to know as little of night as of inanimate. On shore, for instance, at Tromsø, people are out walking or standing at their house-doors, enjoying the night as we do the day. Perhaps they retire to sleep at one or two; but sleep seems scarcely a necessity to them, and they are up again early. It deserves to be recorded also that a photographer at Tromsø took successful portraits of a large group of steamboat passengers exactly at midnight of June 27. It need hardly be mentioned that neither within the Arctic circle nor considerably south of it were any stars visible at midsummer, nor till the end of July; and the moon but rarely, and then as pale as at noon in England. Of course this description is true only of bright cloudless nights; there are dull nights there, as there are dull days with us; and many a traveller may steam from Thronthjem to the North Cape without ever seeing the sun at midnight, or being able to read the smallest print all night through his porthole, as the present writer could do shortly after leaving Thronthjem.

The temperature is very different from what is often supposed. It varies to an extraordinary degree with the clearness of the day and with the direction of the wind. A north or north-east wind brings severe cold; yet if it be not very strong, the sun shining free from clouds counteracts it so far as to make every sunny seat very hot. Especially at night and in the early morning is this heat remarkable, because then we expect cold and dew. A south or west wind is of course mild, and would cause great heat but that it generally brings clouds and rain, as on the similarly circumstanced west coast of Scotland. On the land the heat is felt in the Arctic region far more than on the sea. The soil undergoes no cooling process in the night, and is therefore unfreshed by any dew. The hills afford frequent shelter from the wind, and enclose many a spot on which the sun pours his full heat; while on board ship the wind is always present. On this account many of the valleys in the far north have an intolerable and worse than tropical heat, and large tracts are said to be absolutely uninhabitable from the mosquitoes, against which no protection is found to be of the slightest use. The valley of the large river Alten, which is leased to the Duke of Roxburgh for salmon fishing, enjoys an unenviable notoriety for this pest, of which in this region Professor James Forbes writes:—"It appeared to me difficult to imagine that custom could reconcile any one to such a continuous infliction. . . . More paradoxical still it does appear to any one but an angler, that the charms of sport should be sufficient to induce English gentlemen every year to spend their days and nights an unprotected prey to these savage insects; and, most unexpected of all, to find a delicate English lady surrendering herself to her husband's passion for fishing so completely as to become a willing prisoner in this terrible locality." On the sea, however, and in places on the coast like Tromsø, mosquitoes are rarely met with. The west coast of Norway, like that of Scotland, is directly exposed to the rain-bringing winds, the south-west and west. Hence the rainfall is considerable, but more in the southern part (south of the promontory of Stadt, 62° 10') than in the northern. At Bergen the rainfall is actually seventy inches in the year, the rain is heavy and lasting, and about half the days of the year are wet. This of course greatly interferes with the traveller's comfort; but no place is probably so bad as Bergen, which few persons see in fine weather. To the north of Bergen, the country about the Sognefjord, the Romsdal, Thronthjem, and the Arctic region do not appear to be especially rainy; and July, when travelling is most delightful, is fortunately one of the finest months.

Travelling to the far north means, to all except a number of adventurous explorers too small to be worth estimating, taking a place at Thronthjem on one of the Norwegian mail steamers which ply along the coast from Hamburg to Vadsø, the furthest place in Norway, on the Varangerfjord beyond the North Cape, and near the Russian frontier. These steamers ply weekly during the summer; and continue running even throughout the winter, though less frequently, and less rapidly, since navigation through channels so narrow and so beset with rocks is impossible in the dark winter nights. There are also several rival lines for a part of the distance in the summer, proving the existence of a more considerable commerce than an un instructed foreigner would believe possible. There are stations at which these steamers stop, every two or three hours on an average. The vessels are generally large and well appointed for passengers—mostly built on the Tyne or Clyde, but with native officers and crew. Indeed they are so good that one cannot help wishing they would establish a line between Norway and England, which would break up the monopoly at present enjoyed by a single firm. The west coast of Norway is so well guarded on the west by islands, or at any rate by low reefs of rock scarcely visible to the eye, that there is no danger of heavy seas, and scarcely any of sea-sickness to the most sensitive, from Christiansand to Hammerfest. Not unfrequently the vessel steams for hours through straits as narrow as the Sound of Mull. The general and almost constant character of this whole coast is high, craggy, and bare. The rocks attain very generally a height of seven or eight hundred feet; but occasionally, especially near 65°, and northward from thence, form very imposing chains of mountains of three or four thousand feet, to take the lowest estimate. When these are seen covered with dazzling snow far down their sides and in their gullies, wherever snow will rest, they assume the grandeur of Alpine peaks, and

seem much higher than they really are. This was the case this summer, the snowfall having been extraordinarily copious in March and April. The sides of these coast mountains are generally so steep that no soil can be formed and no vegetation cover them. The traveller, therefore, passes along believing it to be a barren, iron-bound district which will support neither vegetation nor animal life. Yet a Norwegian will tell him that immediately behind these bare rocks are well-watered valleys full of forest; and where, as at the Namsenfjord, the vessel turns and sails inland for many hours, he sees the truth of this statement; the hill-sides are clothed with birch, Scotch fir, and Norwegian pines, with alders and willows in the low wet bottoms. The steamboat stations, indeed, generally present a striking contrast to the grand but barren crags. You see the sailors prepared for running into a station, but all seems bare rock in front, with only a few hog's-backs of rocks to be avoided, and no inlet anywhere; suddenly the vessel veers round the most unlikely point of all, and reveals a little land-locked bay, with a few gaily painted wooden houses and warehouses, some slopes of wondrously green grass, a few trees, the never-failing potato, and perhaps a field of oats or turnips. If it be a place of some importance, a road may be there, and a wooden church with a spire, painted brown; and on the quay many barrels of salt fish and piles of stockfish which scent the air.

There are some places of importance north of Thronhjelm, which itself deserves to be regarded as the most northern city and centre of civilization in Norway, or indeed in the world, unless Archangel can dispute its claim. The chief are Namsos, Bodø, and Tromsø. Namsos lies at the head of the long Namsenfjord, at the mouth of the Namsen, a large navigable river which flows through a well-peopled district, enjoying a warm summer climate, and possessing corn, grass, and forest. Bodø is at the mouth of the great Saltenfjord, within the Arctic circle ($67^{\circ} 20'$); it is opposite the southernmost of the Lofoten Islands, which occupy more than a quarter of the horizon, and are seen as a long nearly unbroken chain of crags, bare, bold, barren, and of the most fantastic shapes. Their serrated forms have been compared to a shark's long row of teeth; but the shapes are very irregular. From Bodø, which is about sixty miles off, they are seen with the utmost distinctness on a clear day; no land intervenes, and they seem only a few miles off. This year, at the end of June, the whole range of islands was covered from top to bottom with brilliant snow, which gave them an indescribable and ethereal beauty. Some of the peaks are very sharp, like the Matterhorn; many remind one of the Ouchullin hills in Skye; and some present great masses with rounded summits. Some it was impossible to believe less than about five thousand feet high, and they might well be higher. These islands are peopled by a numerous and hardy fishing population, who take chiefly the cod, from the liver of which the oil is extracted. From Bodø another steamer starts after the arrival of the mail, and makes a round among the islands, which must be extremely interesting. Bodø is reckoned a town, and may have about a thousand inhabitants; it is pleasantly situated, with much grass and some corn in the valley, and pleasant though not very high hills in the background and along the coast. On these hills may be found many Alpine or subalpine plants—*androsace*, *cyfrage*, *dryas*, *anemone*, *azalea*, besides the heather and berry-shrubs of our own hills—*bilberry* and the Norwegian *mollibere*, less known to us as the cloudberry. The flora of the Arctic region is apparently richer in species than that of the middle part of Norway; but the latter is so luxuriant, so rich in individual plants, as to give the impression of far greater profusion. The next important place is the town of Tromsø. This is placed on a small island, separated by a narrow channel from a larger island on the east, and thus well protected against wind. There are always many ships to be seen in its harbour, Norwegian, Russian, German, and others. Stacks of dried stockfish are to be seen all about, drying in the sun. Ships are built and repaired here extensively, as indeed is the case more or less in all even quite small coast stations. There are many good shops, one or two quite splendid with plate-glass, and one exhibiting the wonder of the place, the fashionably dressed boy and girl, life-size, which we associate with the name of R. Moses and Son. Behind the town are hills wooded with birch and pine, and having a few pleasant country houses with a good view of the bolder and finer hills of the opposite island. But in June, outside the town, one comes very soon into the snow. The chief pride of Tromsø is, or ought to be, its noble cathedral church. It is built entirely of wood, which has still its first freshness of colour. It is very large, and cruciform. The interior is scrupulously clean, and the railings, &c., are nicely carved. It possesses a noble organ, and the Lutheran hymns sound as finely there as in some of the best churches in Germany. At Tromsø, side by side with this civilization, one meets the first traces of barbarism. Many Lapps live here or in the neighbourhood, and though the missionaries have done wonders among them in education and reformation of manners, they must always be regarded as a lower race. Their capacities, in fact, seem very limited, and they remain a race apart, almost like the Gipsies.

JOHNSON'S RESIDENCE AT OXFORD.

MR. FITZGERALD, in his recent edition of Boswell's Johnson, has reopened a question which, though perhaps of no very great importance in itself, is yet not without its interest. Johnson, as our readers will remember, through want of means was forced to

leave the University before he had completed his residence and taken his degree. Boswell had stated that Johnson had been a member of Pembroke College for little more than three years. No doubt was thrown, so far as we know, on this statement, till Mr. Croker, after an inspection of the College books with the help of Dr. Hall, the Master of Pembroke, maintained that Boswell was altogether wrong, as Johnson had only been an actual member fourteen months. Mr. Fitzgerald, we notice by the way, says that "Mr. Croker was positive that Johnson did not remain more than a year and ten months at Oxford." This error is of the less importance in Mr. Fitzgerald's note as he himself affords his readers the means of correcting it by quoting some six or seven lines further down Mr. Croker's actual statement, that "Johnson was but fourteen months at Oxford." Not even has Mr. Croker—far less has Mr. Fitzgerald—brought together all the facts that bear on this question, though each, without first carefully summing up the case, has ventured to speak with all the authority of a judge from whose decision there was no appeal. We have little confidence in our own power of arriving at a decision one way or the other, and we shall content ourselves with putting before our readers the statements made on each side, the difficulties which have to be overcome, and the facts which we have ourselves at some labour gathered together. Like Mr. Fitzgerald, we must express our obligations to Professor Chandler of Pembroke College, for the assistance he has so kindly rendered us by his searches into the musty old battel books.

Boswell's statement as to Johnson's residence is precise, and Boswell, as we need scarcely say, when he speaks of any matter positively, is very rarely proved to be wrong. He says, "*The res angusta domi* prevented him from having the advantage of a complete academical education. The friend to whom he had trusted for support had deceived him. His debts in College, though not great, were increasing, and his scanty remittances from Litchfield, which had all along been made with great difficulty, could be supplied no longer, his father having fallen into a state of insolvency. Compelled therefore by irresistible necessity, he left the College in autumn 1731, without a degree, having been a member of it little more than three years." Hawkins's statement, in his *Life of Johnson*, agrees with Boswell's. He says:—"The time of his continuance at Oxford is divisible into two periods, the former whereof commenced on the 31st day of October, 1728, and determined in December 1729, when, as appears by a note in his diary in these words—'1729, Dec. 8, J. Oxonia rediit'—he left that place, the reason whereof was a failure of pecuniary supplies from his father; but meeting with another source, the bounty, as it is supposed, of one or more of the members of the Cathedral, he returned, and made up the whole of his residence—about three years." These two statements, though they differ in some points, are almost at one as to the time of Johnson's residence. It might be objected that after all we have the evidence only of one writer, and not of two, as Boswell, whose work was the later of the two, might have merely followed Hawkins. But Boswell not only took a great deal of trouble to test the accuracy of all the statements he made on the authority of others, but in this case also he had independent authority of his own. He had lived in the house of Dr. Adams, the Master of Pembroke, who had been a Fellow when Johnson entered, and who was able therefore to speak with exact knowledge in "that authentic information which he obligingly gave" Boswell. Nevertheless, as we shall presently consider, it is not impossible that Boswell may have been influenced by Hawkins's statement. According, then, both to Hawkins and Boswell, Johnson entered Pembroke in October 1728, and left it in the autumn of 1731. When, however, Dr. Hall consulted the College books, he found that they were very far from agreeing with this statement. On the information he furnished, Mr. Croker maintained that Boswell was altogether wrong both in his statement as to residence and in one or two anecdotes which depend on the duration of his residence. Dr. Hall says:—"He was not quite three years a member of the College, having been entered October 31, 1728, and his name having been finally removed October 8, 1731. It would appear by the temporary suspension of his name, and replacements of it, as if he had contemplated an earlier departure from College, and had been induced to continue on with the hope of returning; this, however, he never did after his absence December 1729, having kept a continuous residence of sixty weeks." Mr. Croker remarks on this:—"It will be observed that Mr. Boswell slurs over the years 1729, '30, and '31, under the general inference that they were all spent at Oxford, but Dr. Hall's accurate statement of dates from the College books proves that Johnson *personally* left College 12th December, 1729, though his name remained on the books near two years longer." He goes on to add:—"That these two years were not pleasantly or profitably spent may be inferred from the silence of Johnson and all his friends about them. It is due to Pembroke to note particularly their absence, because that institution possesses two scholarships, to one of which Johnson would have been eligible, and probably (considering his claims) elected in 1730, had he been a candidate." We may say, in passing, that these scholarships a few years ago were worth only 10*l.* each, and that there is no likelihood that they were ever of greater value.

Hereupon Mr. Fitzgerald comes on the scene. Ha, too, has had the College books investigated, and "with the assistance of the Rev. Whitwell Elwin has arrived at the conclusion that Mr. Croker was wrong, and that Boswell, as indeed he always is in points of importance, is right. I found," says Mr. Fitzgerald,

"to my surprise, that 'the authority of the College books,' which sounds impressively enough, resolved itself into no more than certain entries for commons, or 'battles,' in the battery books; while on the absence of 'charges' against Johnson's name during particular years the whole argument is founded." Mr. Fitzgerald is, we notice, a Master of Arts. If he belongs to either Oxford or Cambridge he ought surely to know that in all cases the proof of residence is established by these entries in the battery books. The authority of the College books not only sounds impressively, but is impressive—impressive, that is to say, on any mind that is capable of understanding a fact, and receiving from it an impression. From December 12, 1729, till October 1, 1731, the charges against Johnson amount to scarcely six shillings in all. It is certainly worth noticing that these charges are somewhat scattered, and that his name disappears from the College books more than once, to reappear a few weeks further on. Of Mr. Fitzgerald's inaccuracy we have here again to complain. He states as a matter of importance—for on it he founds an argument—that Johnson's name disappears wholly in January 1730. And yet a few lines above he had quoted an entry for January 30th of that year, while in the College books there is, we learn, also an entry for January 2nd. It is hardly worth while to follow the reasoning of one who is so careless in stating his facts. We shall pass from him to Mr. Whitwell Elwin, whose authority on a matter connected with the early part of last century is deserving of respect. Mr. Elwin agrees with Hawkins in his statement that in December 1729 Johnson would have had to leave College had he not obtained assistance from outside his family. He does not agree with him as to the source whence that assistance came. "It must, I think, have been the gift of the College," he says, "or it would have been charged to Johnson, whatever might have been the quarter from which he derived the money to pay the bill. If we may guess the course of events from the materials we possess, I should say that Johnson, just before the Christmas vacation, informed the tutor of his inability to remain at College; that it was then settled that he should return home and consult with his father; and that in the two or three weeks which elapsed before he set out his ordinary 'battles' were supplied gratis. The result, we may presume, of his Lichfield visit was an announcement to the tutor that he could not raise funds to complete his residence, and the result of the announcement that the College, in consideration of his great learning and abilities, resolved that he should have his 'battles' free."

We have now put before our readers the original statement of Boswell and Hawkins, the facts brought forward by Mr. Croker to upset it, and the assumptions made by Mr. Elwin to support it. Boswell and Hawkins are very positive, but no less positive with their silent record are the old College books. Had we had no other facts to go by, we should have been inclined to assume that Boswell had learnt from Dr. Adams that Johnson had had his name three years on the books, and perhaps, not aware how often it has happened that residence has ceased long before a name is removed, having Hawkins's statement moreover to follow, had jumped at the not unnatural conclusion that he had resided as long as he was a member of the College. But there are other facts which we will set forth as briefly as we can. Boswell states, "I have from the information of Dr. Taylor a very strong instance of that rigid honesty which he (Johnson) ever inflexibly preserved. Taylor had obtained his father's consent to be entered of Pembroke, that he might be with his schoolfellow Johnson, with whom he was very intimate. This would have been a great comfort to Johnson. But he fairly told Taylor that he could not in conscience suffer him to enter where he knew he could not have an able tutor." Taylor went to Christ Church, and, as Boswell goes on to say, it was in going to get his friend's notes at second-hand that Johnson saw that his poverty was noticed by the Christ Church men. It is not quite clear from Boswell whether this latter part of the story rests on the authority of Taylor. If it does, then the question is decided, for on Taylor's evidence we may rely, and Taylor did not enter Christ Church till June 27, 1730. If Johnson then was in residence at the same time with him, he clearly did not leave in 1729. This seems indeed, at first sight, to follow from that part of the story which, as we are expressly told, rests on the information of Dr. Taylor. But we must remember that Taylor might have had his name entered some months before he came into residence, and that after his name was entered Johnson might have left. Nevertheless the whole story is very strong evidence that Johnson was in residence in the latter half of the year 1730. Mr. Croker remarks on it, "Circumstantially as this story is told, there is good reason for disbelieving it. Taylor was admitted commoner of Christ Church, June 27, 1730; but it will be seen that Johnson left Oxford six months before."

Next to Dr. Taylor's evidence comes that which Dr. Adams can be made to furnish. He, as Boswell says, "has generally had the reputation of being Johnson's tutor. The fact however is, that in 1731 Mr. Jorden quitted the College, and his pupils were transferred to Dr. Adams; so that, had Johnson returned, Dr. Adams would have been his tutor." Boswell goes on to say, "Dr. Adams paid Johnson this high compliment. He said to me at Oxford in 1776, 'I was his nominal tutor, but he was above my mark.' When I repeated it to Johnson, his eyes flashed with grateful satisfaction, and he exclaimed, 'That was liberal and noble.'" Mr. Croker has the following note on this passage:—"If Adams called himself his nominal tutor only because the pupil was above his mark, the expression would be liberal and noble; but if he was his nominal tutor only because he would have been

his tutor if Johnson had returned, the case is different, and Boswell is, either way, guilty of an inaccuracy." Mr. Fitzgerald pays no attention to Mr. Croker, but broadly says, in speaking of Hawkins's statement about Johnson's three years' residence, "Nothing can be more explicit, or more consistent with Boswell's narrative, and with the statement that Dr. Adams was his 'nominal' tutor in 1731." We cannot admit, however, with Mr. Croker that Boswell is, either way, guilty of an inaccuracy. Suppose a brief pause between the two parts of Dr. Adams's statement, and all is explained. "I was his nominal tutor; that is to say, his name was on my lecture lists; but even if he had attended I should still have been his nominal tutor, his tutor only in name, for he was above my mark." Both Mr. Croker and Mr. Fitzgerald should have tried to find out when it was that Adams took Jorden's place. Jorden's Fellowship was filled up, as we have ascertained, on December 23, 1730. It is very improbable that he continued to be tutor after he had vacated his fellowship, and we may fairly assume that his pupils were transferred to Adams in the beginning of 1731. If so, what becomes of the statement that Johnson was resident till the October of that year? We will next consider the evidence to be derived from the case of Mr. Edwards, Johnson's fellow-collegian. Johnson, in his diary for 1778, says, "In my return from church I was accented by Edwards, an old fellow-collegian, who had not seen me since 1729." Mr. Croker, first noting that Edwards entered Pembroke in June 1729, says, "This deliberate assertion of Johnson, that he had not seen Edwards since 1729, is a confirmation of the opinion derived by Dr. Hall from the dates in the College books, that Johnson did not return to Pembroke after Christmas 1729—an important fact in his early history." Mr. Fitzgerald, finding we suppose no means of meeting Mr. Croker's argument, passes it over in silence. It did not occur to Mr. Croker that it might have been Edwards, and not Johnson, who left Pembroke early. We have ascertained that Edwards's name occurs for the last time on April 24, 1730, but, to judge from the amount of his battels, it would seem likely that he did not reside after April 10. To a man used to Old Style, as Johnson was, April 10, 1730, is so near to 1729 that at the distance of nearly fifty years Johnson may easily have been wrong by a week or two. Edwards's case, therefore, seems to us to prove nothing.

Boswell, in giving an account of Johnson's health, says that "while he was at Lichfield in the College vacation of 1729 he felt himself overwhelmed with a terrible hypochondria." Now the College books show—if battels can be trusted—that Johnson was absent only one week in the long vacation of 1729. Boswell may have meant the Christmas vacation, which, according to the Old Style, would have all fallen in 1729. It was in a vacation, however, that Johnson had this long illness, and he enjoyed, as it seemed, no vacation (except one of a week's duration) till the end of 1729 and the beginning of 1730 (N. S.) If Boswell then is correct in his statement that it was in a vacation that he was attacked, it would follow that Johnson returned to College in 1730. As an argument on the other side we may set the statement, which Boswell mentions merely to refute, that Johnson had been "assistant to the famous Anthony Blackwall." Boswell says this cannot have been the case, "for Mr. Blackwall died on the 8th of April, 1730, more than a year before Johnson left the University." The statement, however, may be taken in evidence for what it is worth, that Johnson did leave at the end of 1729.

In the Caution Book of Pembroke College occur the two following entries, which we are, we believe, the first to publish:—

Oct. 31, 1728.

Recd. then of Mr. Samuel Johnson Coffin: of Pem: Coll: ye sūm of seven Pounds for his Caution, which is to Remain in ye Hands of ye Bursars till ye said Mr. Johnson shall depart ye said College leaving ye same fully discharg'd.

Recd. by me

JOHN BATCLIFF, Bursar.

March 26, 1730.—At a convention of the Master and Fellows to settle the account of the Caution it Appea'd that the Persons Accounts underwritten stood thus at their leaving the College.

Caution not Repayd.

Mr. Johnson. 7 0 0

Battels not Discharg'd.

Mr. Johnson. 7 0 0

It scarcely seems probable that the College authorities, if they resolved, as Mr. Elwin guesses, to give Johnson his battels free, should have retained till the year 1740 his caution money in their hands. If they were generous enough to support him without payment, they would, we should think, have been generous enough to return him the money which they had received from him as security. For why should security for payment be required from those who are free from the payment itself?

We will now, as briefly as we can, enter upon one head of evidence which, so far as we know, has not been touched on. Johnson, Mr. Fitzgerald and Mr. Elwin say, was at Pembroke in 1730. Can they show that among his fellow-collegians there were any who entered so late as that year? We have somewhat carefully gathered together the names of all his fellow-collegians whom he mentions, and, with one remarkable exception, we have ascertained that all of them entered before 1730. It is possible, however, that some name has escaped our notice. Adams, as we have shown, was already a Fellow when Johnson entered. Mecke, whose superiority he could not bear, and from whom, to quote his own words, "I tried to sit as far as I could that I might not hear him construe," matriculated in 1725; Edwards, as we have shown, in 1729. Phil Jones and Fludver, with whom he used to play at draughts—the one of whom loved beer and did not get very forward

in the Church, while the other turned out a scoundrel and a Whig—were about of Johnson's standing. Jones, indeed, must have been his senior. To this fact, for such we believe it to be, that Johnson mentions no Pembroke man who entered after 1729, there is the one exception of the celebrated preacher George Whitfield. He is twice mentioned in Boswell as having been Johnson's fellow-collegian. In Boswell's account of October 12th, 1779, on the passage beginning "Of his fellow-collegian the celebrated Mr. George Whitfield," &c., Mr. Croker quotes this note of Dr. Hall's:—"George Whitfield did not enter at Pembroke College before November 1732, more than twelve months after Johnson's name was off the books; so that, strictly speaking, they were not fellow-collegians, though they were both of the same College." But in Boswell's *Journal of a Tour to the Hebrides* we find the following passage under the date of August 15th:—"We talked of Whitfield. He said he was at the same College with him, and knew him before he began to be better than other people (smiling)." Now Johnson read this journal in manuscript, and, as Boswell on one occasion tells us, corrected any mistakes he had made. Yet it is quite certain that Johnson, even if he was at College in 1731, most certainly was not there in 1732. Not only have we Boswell's statement and the authority of the College book, but we have the evidence of a letter he wrote from Lichfield on October 30, 1731, and two entries in his diary for 1732. If he had known Whitfield he would have known Sheustone, for Sheustone entered Pembroke six months before Whitfield; but, so far as we know, there is no evidence that they were ever acquainted. We cannot pretend to reconcile Boswell's statement—and for the matter of that Johnson's, seeing that he revised the manuscript—with the facts of the case. We are told, indeed, that a year or two after he left Oxford he borrowed a book from the library of Pembroke College. It would not have been impossible, or even improbable, that a man who, like Johnson, frequently walked from Lichfield to Birmingham and back would have trudged all the way to Oxford to fetch the book. In that case he might have seen Whitfield. But Boswell tells us that "the first time of his being at Oxford after quitting the University" was in 1754.

The evidence then, as those who have had patience to follow us will have seen, is strong on both sides, and in one part at least full of perplexity. It is not impossible that a further search into the College books might clear up the mystery. Whitfield, as we read in his life, entered as servitor and managed so nearly to pay his way that, as he says, "for almost the first three years I did not put all my relations together to above 24l. expense." We should be curious to learn whether his battels were kept like a commoner's, or whether he had his food free of charge. It is almost impossible to suppose that Johnson could have consented to accept a servitor's post, and yet the supposition is scarcely less violent than the one to which Mr. Elwin resorts. He indeed is bound to show, in support of his hypothesis, at least one other instance at the University of free commons. At Pembroke College at all events we are informed that there are not, and it is believed never have been, free commons. Even if a man had free commons, nevertheless as a matter of account and as a proof of residence we should have expected that his battels would have been kept in the usual way. It is not impossible, however, that a servitor lived on the food that was left over from the table of "the gentlemen," to quote Whitfield's own expression. Hawkins, we would notice, mentions a change as having come over Johnson in his treatment of the servitors. In the first part of his residence he used "to join with other of the young men in the College in hunting, as they called it, the servitors." But this was only for a time, for "he could not," we read, "at this early period of his life divest himself of an opinion that poverty was disgraceful; and was very severe in his censures of that economy in both our Universities which exacted at meals the attendance of poor scholars under the several denominations of servitors in the one and sizars in the other; he thought that the scholar's, like the Christian's, life levelled all distinctions of rank and worldly pre-eminence." Can it be the case that some change in Johnson's circumstances, some difference in the position he held at College, taught him what forbearance "worth" should meet with when it is "by poverty depressed"?

COLOPHONS.

IT is perhaps strange that the great Gothic revival made so little mark upon title-pages. Pugin's admiration for the thirteenth century does not seem to have tempted him to do without these modern inventions. His own titles were of the most modern type. In one, if we recollect aright, he used the picture of a door at Westminster Abbey to put the name upon. The fact is, he had no ancient example to follow. We only find title-pages struggling into existence about the beginning of the sixteenth century. Mr. Ruskin, too, might have been expected to advocate their abolition. His difficulties in making them must surely be very great. We are not certain that he has never denounced them—not his own, but other people's—as lying abominations. But he has gone no further, though it is manifest that the sale of several of his works would be improved if they could be identified merely as Mr. Ruskin's last book, or the last but one. No working-man, however noble, has yet, we feel assured, asked in a shop for *Fors Clavigera*: just as no young lady, if she has not graduated at Girton, will ask for *Horæ Subsecivæ*, though Rab and his Friends are so popular. Why Dr. Brown should have been rash enough to follow

Mr. Ruskin in this particular we cannot say. Two remarkable books, at least, might benefit by the abolition of title-pages, and the reason given by the late John Stuart Mill for not studying music points to a further advantage. Mr. Mill found out that at some future period all possible combinations of sound will have been used up. Already a good title has to be backed up by an injunction in Chancery. By a good title must be meant one which has an attractive power upon readers and buyers, for few modern books have titles of any better kind. Titles, in fact, and the books for which they stand, are gradually, as it were, drifting away from each other, and eventually a day may come when a book and its name will have no more necessary connexion than an earl and the county which gives him his designation. Let any one who doubts it look at the amount of information Bishop Butler contrived to cram into the not very long title of his *Analogy*, and compare it with that of any recent work on a similar subject. And this is only one example.

Considering, however, the many uses to which title-pages have been put, it is odd they were not invented sooner. A book had always a name as a matter of course. But for all the information which, in modern literature, one expects to find on the first page, the student of old literature looks to the last. Here it is that he seeks for the date, for the author's name, haply for the writer's as well if it be a manuscript, or for the printer's if it be not. How the mediæval student did without title-pages we are not informed. He has not complained. There is nothing on the subject in Richard of Bury. He objects, it is true, to bread and butter, and begs for cleanliness in the readers of his books; but apparently he no more complains of the want of title-pages than of the want of telegrams. As long as books were in rolls the colophon at the end was better than any title at the beginning could be. But when books came to be made up into leaves, it is curious that the regular title-page did not follow immediately as a logical sequence. Its absence must have been a boon to some. For authors, at least, the great modern literary anxiety did not exist. The scribe or the early printer had never to wait in his work while the author thought of a name; nor had the author, on the other hand, the distress of seeing his book called by a name he did not like, chosen by the publisher to catch the popular ear. A modern author was recently heard to designate the second volume he had issued through an eminent contemporary publisher as "the second book of Kings," the name chosen for it not being to his taste. Such searchings of heart were spared to the literary folk of the fifteenth and previous centuries, and the admirers of Caxton must feel a thrill of satisfaction that our English prototypographer died in ignorance of troubles on the score of titles. This fact is not, we fear, as widely known as it ought to be, for not long ago repeated mention was made of Caxton's title-pages in a sermon for the Printers' Pension Fund. In what Ames or Oldys might have termed pre-titular ages, the naming of a book was a simple matter. The scribe took a penful of red ink and put at the end, Here ends So-and-So on Such a subject, or words to that effect. If the job he had accomplished was one which had given him much trouble, or of which he had cause to be proud, he added a line of thanks-giving, and perhaps a note of admiration at his own skill. This forms the colophon, together sometimes with the date either of the writing of the copy or of the original composition of the book. To distinguish which of the two is intended often puzzles the student. Many a book is catalogued as of the thirteenth century which was written in the fifteenth, because the colophon belongs to the author, not to the transcriber. It is a profound problem, into which we have no present intention of entering, whether the dates in some of Caxton's colophons refer to the authorship or the printing. Upon the right reading turns the question whether he is not the first French as well as the first English printer. But in manuscripts such a difficulty seldom occurs. Thus the colophon of a Bible of the thirteenth century is a very typical example of simplicity, and of a certain sense of self-satisfaction:—

Quis scripsit scribat, Virgilius ape domino vivat;

the jingling verse alone preserves his name for us, but, as he was able to put thirteen lines of writing into the space of an inch, he deserves to be remembered. Nor were the early printers more averse to displaying their powers. It may be questioned how far the value of a modern book would be increased by the addition of a few lines composed by the printer. But the first Bible printed at Rome shows in the colophon what Sweynheim and Pannartz thought of their art, and what of themselves. Their self-praise is somewhat chastened by the bashfulness of strangers in a strange land. Great and useful as was their craft, it came from beyond the Alps, and their very names were uncouth and unpleasant to the Italian ear:—

Aspera ridebis cognomina Teutona; forsan
Mitiget ars musis inscia verba virum;

a couplet which old Henley, in his translation of Montfaucon, renders quaintly enough:—

Rough German names perhaps may cause your smiles,
But these will grow familiar by their toils.

Dogget of a still more simple type adorned the first French colophons:—

Limprimeur est Michel le Noir
Qui a Paris a son manoir,

and so on. Prose satisfied the longings for fame of Master Jacobus Dusenensis, who set up a press at Vicenza, where he praises his first edition of Claudian, "que non minus eleganter quam diligenter

impressit." But colophons reached probably their highest development in our own country shortly before they disappeared finally from the scene. The Martin Mar-prelate controversy marks their culminating point. One of these strange tracts professes, hypothetically, "If my breath be so hote that I burne my mouth suppose I was printed by Pepper Ailie."

Remembering the importance of colophons, both before and after the invention of printing, it is curious to remark how often mistakes occur in them. By all ordinary rules they should have given place to titles as soon as rolls became obsolete; but, if the information they convey could always be considered trustworthy, they would be of incalculable advantage to the modern student of a difficult branch of history. One of the earliest accounts we have of the invention of printing is given in the colophon of a book printed by John Schoeffer in 1515. If we could only be sure he is speaking the truth, the information he gives would be much more valuable. Unfortunately it will not tally with internal evidence. The differences are happily of little moment; but it must remain for the present a question whether the Germans are better justified in erecting a statue to Gutenberg than the Dutch were in setting up Coster at Haarlem. But this is dangerous ground to tread upon; the discoverer of the Haarlem imposition had to fly from Holland and to take refuge in Prussia. Should he now divulge anything indiscreet about Gutenberg, we may perhaps have occasion to welcome him in England. But here, too, we have had our controversies, if they were scarcely so severe as those in which Dr. Van der Linde has been engaged. The whole subject of the liberty of the press was, however, concerned in the question of the date of a St. Jerome printed at Oxford. Since bibliography has become more of an exact science than it was in the days of Sir Roger L'Estrange, the date 1468 in the colophon of that little volume has been proved to be a printer's error, an *x* having been omitted, and the real year of the book's appearance must be postponed at least to 1478; while Caxton's supremacy as the first printer in England, which for a time seemed in danger, must be upheld. Some very elaborate treatises have been written on the subject, and a few bibliographers still perhaps survive who are not convinced of the settlement of the claims of Rood and Corsellis. Caxton himself sinned in the same way in one of his colophons, that to his edition of Gower. Fortunately he gives us well the regnal year as the date, and we are relieved from the difficulty of having to account for his printing a book some time after his own death. But with respect to Caxton in particular, his pupil Wynkyn de Worde has caused the greatest confusion by an untrustworthy colophon. In his *Glanville De Proprietatibus Rerum* he asserts that Caxton has also printed an edition. "Of your charyte call to remembrance the soule of William Caxton, first prynter of this boke in luten tong at Coleyn." Mr. Blades, after infinite trouble and research, has come to the conclusion that Caxton never printed a *Glanville*, and never printed at Cologne; but many biographers and bibliographers have been sorely puzzled by Wynkyn's mistaken assertion.

So far we have spoken only of colophons as occurring in printed books or manuscripts. But the existence of manuscript colophons in printed books is a matter of some importance. The difficulty of assigning an exact date to the invention of printing is lessened to some extent by the discovery of a manuscript note or colophon at the end of a copy of the celebrated Mazarine Bible in the French National Library. It is written by Henry Cramer, a scribe or illuminator, whose duty it was to rubricate the book—that is, not only to rule it with red lines and to put in certain notes and headings, but also to paint the capital letters on every page. And Henry Cramer unconsciously conferred a favour on posterity when he added to his own name the date of August 1456. His name is not of much importance. Miniators and illuminators were numerous in those days. In Italy and in Flanders they formed whole guilds and schools. But the date, supposing it to be correct, is of the utmost importance, if for nothing else, because it allows of Gutenberg's connexion with this first effort of the printing press; for the book must have been printed at least a few months before, and if, as is usually believed, Gutenberg and Fust, the prototype of Dr. Faustus, quarrelled and separated as early as 1455, there is no reason against the tradition which connects his name with this first great enterprise of the printing press.

Of all the nuts offered by colophons, none is harder than that presented by the existence of the word colophon itself as a technical term in the history of the art of printing. Why the final sentence of a book should be called after a town in Asia Minor nobody seems able to say. It is true that the town or city in question is one of those seven which claimed Homer when dead, and that, as he may have begged through it in his lifetime, it has a possible connexion with the dawnings of literature. This is a question for the classical dictionary. But the use of the name for the closing sentence of a book cannot be of any great antiquity. A jest of Erasmus may have given rise to it. He refers to a passage in Strabo in which the virtues of the Colophonian cavalry in deciding the fate of a battle are mentioned, and an old Greek proverb is quoted. According to others, the people of Colophon had a casting vote in the Ionian diet; but both these explanations have an air of having been invented to account for the proverb. The Parthian tactics employed in many colophons would have suggested a different, but still classical, name. But unless it be traced to Erasmus, the word in its modern sense can have no great antiquity. It does not occur in Johnson's Dictionary, and it would have been interesting to know what he thought of it. It is, however, very useful, and we may accept it for better, for worse,

though to account for its existence is as difficult as to account for the parallel derivation of California from Califony or Colophony, an old English name for the resin which was a chief ingredient in the composition of Greek fire.

ENGLISH RUFFIANISM.

THE worship of the working-man as the incarnation of everything that is beautiful and good is just now being carried on under peculiar difficulties. His votaries have been in the habit of assuring us that the mere circumstance of being engaged in manual labour at weekly or daily wages is sufficient to ensure the highest moral perfection as well as the most unerring political sagacity. We have been asked to believe that all the virtues are concentrated in the British working-man, and that the most intricate problems of statesmanship can be solved offhand by his natural and unsophisticated intelligence. Unfortunately the accounts of the behaviour of the labouring population in different parts of the country which are constantly appearing in the newspapers scarcely correspond to this ideal picture. Every day the same horrible and sickening story of savage and almost insane brutality is repeated with melancholy regularity. We cannot attempt to reproduce the mass of revolting details which is daily accumulating, but a few recent cases will perhaps be enough. At Hanley two men were fighting, and one tried to bite the other's nose; a bystander interposed, and one of the combatants bit off a large piece of his ear and swallowed it. At Birmingham a police-constable interfered to protect a woman from some roughs, and the whole gang at once fell upon him, knocked him down, and kicked him till he became insensible. In the same town a policeman was stabbed; a landlord was nearly murdered by a tenant of loose character; a journeyman baker felled a woman with whom he lived with the kitchen-poker, and then beat her head with it, at the same time kicking her violently, so that she is not expected to recover; in short, not a day passes without bad cases of stabbing, stoning, beating, or kicking. At Preston, Barnsley, Stalybridge, and other places in the North, similar brutalities appear to be of continual occurrence, all so much the same in their disgusting incidents that it is scarcely possible to distinguish one from another. The *Manchester Guardian* has been at the pains to compile a list of the feats included in a month's kicking. Here are some of the most notable exploits. Some workmen at Oldham get into a wrangle with an old man in a public-house, and one of them strikes him. Somebody remonstrates and says it is a shame, and for this he is kicked to death with clogs. This was the second murder of this kind within a short period, and a third followed immediately afterwards, a man who had rebuked some disorderly fellows in a public-house being knocked down by one of them, while another kicked him in the scientific manner which is locally known as the "running punce." Six colliers at St. Helen's went about smashing windows and doors in a drunken frolic, and at length broke into a house occupied by an old man of eighty and his wife. They thrashed and kicked the woman, knocked out one of the old man's eyes, filled the bleeding socket with lime, stuffed lime down his throat, and finally emptied the rest of the bucket over his head. At Liverpool a sober, peaceable man, walking home with his wife, met a party of roughs one of whom asked for a sixpence. On his suggesting that the best way to get money was to work for it, he was knocked down and kicked to death, three men taking part in the outrage. This is said to be "only one example of the system of street terrorism in Liverpool." A day or two since a cornerman or loafer, who, it is explained, "stands at the corners of streets insulting the passers-by," was so infuriated by the mere sight of a policeman taking somebody to the station-house, that, though the captive was altogether a stranger to him, he seized the constable by the throat and dashed his head against the wall. At Blackburn within a day or two we find a blacksmith attempting to give two policemen what he playfully called "a bit of Liverpool," which means, it seems, stabbing and kicking them. At Dukinfield a man put on his clogs and danced in them on a woman's head. At Bury three men attacked another man without the slightest provocation and nearly killed him with kicking. In another instance a labourer kicked a man to death without assistance. Kicking in the mouth with a clog so as to drive the victim's teeth down his throat is a familiar practice, and is called "purring." At Preston a man kicked and jumped upon a little boy six years old. At St. Helen's three colliers set upon an old man who would not let them drink in his house late at night after the public-houses were closed, and beat him so severely that he died. On Wednesday there were three cases of kicking wives with clogs before the Salford magistrates. At Preston a man broke his paramour's jaw and then flung her out of the window.

It will be observed that these are not mere sporadic cases, nor are they confined to a single district. On the contrary, it would appear that the labouring population generally in the midland and Northern districts is suffering from a sort of epidemic of ferocity and violence. At the slightest word, and often indeed without a word or any provocation whatever, the roughs take to biting and kicking; and anybody who knows what an iron-tipped clog is will understand the sort of wounds which it is capable of inflicting. A knife is also usually carried in order to vary the sport. Perhaps the worst circumstance about these outrages is the cowardice which is almost invariably displayed. The favourite victim is an old man, a woman, or a child, and two
